Shell Cameos.—The art of imitating cameos in shell, which has now attained to such perfection as to rival the delicacy and finish even of antique workmanship, and which is a process quite as artificial as their production from gems, is of modern invention. The shells, like the stones, chosen for this purpose, are such as possess layers of different colors. The most useful are the *bull's mouth*, the under layer of which is red, resembling the sardonyx; the *black helmet*, which has a dark onyx ground; and the *queen's conch*, of which the ground is of a pinkish hue. These shells have three strata, the undermost of which forms the ground, the figure being sculptured in the second, and the third serving to mark the hair, wreaths, armor, and other more prominent objects. The portion of shell having been prepared of the requisite size, form, and thickness by various

mechanical means, it is fixed by some adhesive substance—usually rosin—to a small block of wood, of such form and thickness as to be conveniently grasped by the artist in his left hand. The outline of the object or objects to be represented is then sketched with a pencil, and, in the case of portraits, is usually copied from a previous pencil sketch on paper. The pencil-marking on the shell is then followed with a scratch-point, and the surrounding white substance is removed by means of files and gravers. This latter process, which is more mechanical than the rest, is usually performed by an assistant. The artist then proceeds slowly and carefully to work out his subject by the use of smaller tools; those used at last for deepening the finer lines being scarcely larger than ordinary darning-needles. The manufacture of shell-cameos in Rome commenced about 1805, and is said to have been of Sicilian origin. The art was at first confined to Italy; but during the last 35 years, it has been carried on in Paris to a great extent. A large proportion of the whole cameos manufactured in France are imported into England, and many of them are mounted as brooches, and exported to the United States and the British colonies. See *illus.*, **DIAMONDS, ETC.**, vol. IV.

CAMERA. See **PHOTOGRAPHY.**

CAMERA LUCIDA, an optical instrument constructed of various forms, and for various purposes. Dr. Wollaston's C. L., intended to facilitate the perspective delineation of objects, consists of a small quadrilateral prism of glass, of which AB in the

Camera Lucida.

annexed figure is the perpendicular section, held in a brass frame, which is attached to an upright rod, having at its lower end a screw-clamp, to fix it to the edge of a table. The prism being at the height of about a foot from the table, has its upper face horizontal. Two of its faces, as in the figure, are at a right angle at A; the contiguous faces make respectively with them angles of $67\frac{1}{2}^\circ$; so that the remaining obtuse angle at B contains 135° . Rays coming from an object PQ, and falling nearly perpendicularly on the first surface, enter the prism, and undergo total reflection at the contiguous surface (see **DIOPTRICS**); they then fall at the same angle on the next surface, and are totally reflected again; finally, they emerge nearly perpendicularly to the remaining surface. An eye, as in the figure, then receives the emergent pencil through one part of the pupil, so that an image, pq, of the object is seen projected upon a sheet of paper upon the table. The rays from the drawing-pencil passing the edge of the prism, enter the other part of the pupil; and the pencil and image being seen together upon the paper, a sketch of the latter can be taken. There is, however, a practical difficulty—the image and the drawing-pencil are at distances sensibly different from the eye, and so cannot be seen together distinctly at the same time. To obviate this, a plate of metal, with a small aperture as an eye-hole, is placed at the edge under the eye, so that the rays through the prism, and those from the drawing-pencil, which both pass through the eye-hole, form only very small pencils. By this, the difficulty is greatly diminished. It is still, however, difficult to use the instrument satisfactorily; and though many acquire great readiness in its use, others have never been able to attain the same facility. The instrument is remarkable for its small bulk and portability. A good one will pack in a box 8 in. by 2, and $\frac{1}{2}$ in. deep. Besides this form of the C. L., which is the most common, there are others. Its simplest form is merely a piece of smooth glass fixed at an angle of 45° to the horizon. An image from a horizontal object falling on this glass will be perfectly reflected, and that in the vertical, so that the eye looking vertically down will see the image, and, owing to the transparency of the glass, the artist will be able to trace it out upon paper below. In this case, however (see **CATOPTRICS**), the image will be inverted.

CAMERA OBSCURA (literally, a dark chamber), an instrument invented by Baptista Porta in the 16th century. It is known in its simplest form as a familiar toy, consisting of a rectangular box, furnished at one end with a lens whose focal length is equal to the length and depth of the box; at the opposite end of which a plane reflector is placed at an angle of 45° , which throws the image of any objects to which the lens may be directed on a piece of ground-glass on the top of the box in a non-inverted position, so that they may be viewed or sketched from as in nature.

The C. O. being now an indispensable article in the practice of photography, has received a number of recent improvements, which make it rank as a scientific instrument. The principle, however, involved in the simplest and most refined forms is the same, and may be illustrated and made intelligible by the following experiment: Let a small hole be bored in a window-shutter, and the room be darkened. If, now, the beam of light entering the room by this hole be intercepted by a sheet of white paper,

held at a small distance from the hole, an inverted image of objects without will be seen upon the paper. By placing a small convex lens over the hole, this image is rendered much more distinct, or *sharp*, in photographic language. Moreover, it will be found that, at a certain distance from the hole, the image attains a maximum degree of sharpness; and that if the paper be removed from this point to any position either nearer to the hole or further from it, the image becomes indistinct and confused. At the point of greatest distinctness, the image is said to be *focused*. Such being the principle of the camera, it is evident that in practice the instrument may assume many forms, provided always that it consists of a darkened box or chamber having a hole at one end for the insertion of a lens, or combination of lenses, and at the other a screen, generally made of ground-glass, on which to receive the image.

The body of the instrument may be made of any opaque substance; the tube or tubes are generally formed of brass, and contain one or more lenses; there is the obscured or ground-glass, upon which the image is thrown for the purpose of adjusting the focus; and the rack behind, by means of which, and the double sides of the camera, the body of the instrument may be lengthened or shortened till the image on the ground-screen is accurately focused. This rack is most frequently placed upon the tubes carrying the lenses. The interior of the whole apparatus is blackened, to prevent reflection of the rays falling on their sides, and to impart greater distinctness to the picture.

The *camera-slide* is a thin, dark box, and is used for conveying a sensitive plate from the operating-room to the camera, and back again after exposure. It consists of a rectangular frame, made to fit exactly into the back of the camera when the focusing-screen is removed. At the back is a hinged door, by means of which the plate is introduced into the slide; and in front is a shutter, which is pulled up when the plate is to be exposed, and shut down after the time requisite for the action of the light upon the plate has expired. It must be constructed so that, when substituted for the focusing-screen, the surface of the prepared plate, which is intended to receive the image, shall correspond exactly in distance from the lens with the ground-surface of the focusing-screen. The plate rests upon projections of silver wire in the corners of the slide; and the same slide may be used for plates of different sizes, by introducing into it thin frames of suitable dimensions also furnished with silver-wire corners.

Photographic cameras are generally required for one of three purposes—viz., portraits, landscapes, or copying; and for each of these it is necessary to make suitable modifications in the construction of the instrument. A camera has, however, been recently contrived which combines within itself the conditions necessary for all contingencies. It is called Martin's universal portrait, landscape, and copying camera, and consists, primarily, of a base-board, 30 in. long and 11 in. wide, divided into three pieces, and hinged together by means of broad brass hinges, so as to diffuse the bearing as much as possible, and bolted together when in use by sliding panels of mahogany, extending across the entire width of the base-board. This base-board being grooved on its outer edges, allows the sliding portions of the camera to be moved from one end to the other, so as to alter the relation between object, lens, and image *ad infinitum*.

CAMERA RIUS, JOACHIM—originally, *Liebhard*, which name he changed into C., because his forefathers had been *Kämmerer* (chamberlains) at the court of the bishop of Bamberg—was born at Bamberg, April 12, 1500, and died at Leipsic, after a life devoted to literature, April 17, 1574. He was by nature earnest and taciturn; but the extent of his knowledge, his sobriety of opinion, strength of character, and, when he pleased, overpowering eloquence, won for him the esteem of all his contemporaries. His works, of which several still remain valuable, include an excellent biography of Melanchthon, and a collection of letters by this reformer; also annotations on Cicero's *Questiones Tusculanae* (1525); *Elements of Rhetoric*; *Commentarii Linguae Graecae et Latinae* (1551); and *Epistole Familiares* (1583-95), giving interesting notices of his times.

CAMERA RIUS, RUDOLPH JAKOB, 1665-1721; a German botanist and physician, professor of medicine and director of the botanic garden at Tübingen. He was the first to observe and establish the sexual theory of plants.

CAMERINO (ancient *Camerinum*), a t. of central Italy, in the province of Macerata, situated on a hill at the foot of the Apennines, 41 m. s.w. of Ancona. It has a cathedral, occupying the site of a temple to Jupiter, a university, and some manufactures of silk. Its bishopric dates from the 3d c.; and it was made an archiepiscopal see in 1787. Pop. 12,000.

CAMERLENGO, OR CAMERLINGO (Ital., chamberlain), the cardinal who controls the finances and the secular interests of the pope. During a vacancy in the Holy See, he is sole head in things temporal, and presides over the apostolic chamber or palace. In things spiritual, however, he is assisted by the other cardinals. The cardinal camerlengo is one of the four great officers of the pope, the titles of the other three being *cardinal vicar*, *cardinal patron*, and *cardinal penitentiary*.

CAMERON, a parish in s.w. Louisiana, on the gulf of Mexico; surface low, with many swamps; area, 1552 sq. m.; pop. '90, 2828, with colored. Judicial seat, Cameron.

CAMERON, a co. in n. w. Pennsylvania, traversed by the Pennsylvania and other railroads; 382 sq. m.; pop. '90, 7238. Productions agricultural. Co. seat, Emporium.

CAMERON, a co. in Texas, on the Gulf of Mexico and the Rio Grande; 1960 sq. m.; pop. '90, 14,424, with colored. The portion along the Rio Grande is very fertile; the remainder is grazing land. Co. seat, Brownsville.

CAMERON, DONALD, a Scottish highland chief who fought for the pretender and was wounded at Culloden, but escaped to France. He was the "Lochiel" of Campbell's poem.

CAMERON, JAMES DONALD (usually called "DON" CAMERON), b. Harrisburg, Penn., 1833; eldest son of Simon; graduated at Princeton college in 1852, and since largely engaged in iron, coal, and manufacturing industries of his state. As president of the Northern Central railroad, he did great service to the union cause during the war. In 1876, he was appointed secretary of war, and in Mar., 1877, succeeded his father as U. S. senator. In 1879, he was chosen chairman of the republican national committee in place of Zachariah Chandler, deceased. This position he resigned in 1880, but retained his seat in the Senate until 1896, when he announced his intention to retire from public life. In 1895 he was among those who advocated the free coinage of silver.

CAMERON, JOHN, a famous scholar and divine, was b. at Glasgow about the year 1580, and educated at the university of that city, where, in his 20th year, he held an appointment as reader in Greek. In 1600, he set out to travel in France, where his ability and erudition secured for him a philosophical professorship in the university of Sedan. He afterwards acted as a Protestant clergyman at Bordeaux, and on the death of Gomarus, was appointed to the divinity chair in the university of Saumur, an appointment he held until 1620. Returning to Britain, he was appointed professor of divinity at Glasgow; but in less than a year he returned to Saumur; thence to Montauban, where he received a divinity professorship. Here his opposition to the party who advocated a civil war made him many enemies, by one of whom he was stabbed in the street; and he died from the effects of the wound in 1625. He was considered one of the best scholars of his time; in Biblical criticism, he was inclined to be perverse; where there was a difficulty, he usually chose the opposite view to that held by other divines, especially Beza. His theological opinions were of a somewhat lax character, his works being said to be the foundation of Amyraut's doctrine of universal grace.

CAMERON, RICHARD, a Scottish Presbyterian preacher in the 17th c., who suffered death for the cause he espoused, and from whom the religious sect ordinarily called Cameronians (q. v.) has been named. C. belonged to the extreme party, who held by the perpetually binding obligations of the solemn league and covenant (see COVENANTS), which were set aside at the restoration of Charles II. Along with some others, he strenuously resisted those measures that reinstated the Episcopal church in Scotland, and that proscribed the meetings for public worship of unauthorized religious bodies. Contrary to law, he persisted in preaching in the fields, and became obnoxious to government, to which, indeed, he finally assumed an attitude of defiance. In June, 1680, he, in company with about twenty persons of equal zeal, well armed, entered the town of Sanquhar; and in the market-place they formally renounced their allegiance to Charles II., who had so grossly abused his power, and declared war against him and all his adherents. After this act they retired to the hills between Nithsdale and Ayrshire, where they succeeded in evading capture for a month, though a price of 5,000 merks had been set upon C.'s head by government, and 3,000 upon the heads of the others. On the 20th July, 1680, however, they were surprised by a vastly superior force in Aird's Moss, and after a brave fight, C. was killed. His hands and head were cut off, and fixed upon the Netherbow Port, Edinburgh.

CAMERON, SIMON, b. in Lancaster co., Penn., 1799. In 1845, he was elected by the democrats to the U. S. senate, but joined the republicans on the organization of that party, and was by them re-elected to the senate in 1856. In 1861, he was secretary of war, and in 1862 minister to Russia. Twice again he was chosen senator, in 1866 and in 1872, and was succeeded in that office in 1877 by his son, James Donald. He was one of the leading financiers and business men of the state. He d. 1889.

CAMERON, VERNEY LOVETT, an African traveler, son of the Rev. J. H. L. Cameron, vicar of Shoreham, Kent, was b. in 1844. He entered the navy in 1857, and served some time on the e. coast of Africa. In 1873, he took charge of an expedition to relieve Livingstone, his orders being to join him by the nearest route. He started from Bagamoyo in Mar., and in Aug., at Unyanyembe, met Livingstone's followers bearing his remains to the coast. After making arrangements for their safe arrival, he proceeded to Ujiji, where he found some of Livingstone's papers and a map, which he forwarded to Zanzibar. He then made a survey of Lake Tanganyika, which he found to be disconnected with the Nile system. In the belief that the Lualaba was the upper waters of the Congo, he resolved to follow its course to the w. coast; but owing to the hostile interposition of the native chiefs, was prevented from verifying a conviction, the correctness of which was soon afterwards demonstrated by Stanley. Taking a more southerly route, he reached the Portuguese settlement of Benguela, on the w. coast, in Oct., 1875, whence he returned to England. An account of his travels, which contains a vast number of valuable scientific observations, was published in 1877 in 2

vols., under the title of *Across Africa*. C. was made a companion of the bath, and raised to the naval rank of commander. He d. in 1894.

CAMERON HIGHLANDERS (the Queen's Own Cameron Highlanders), the designation given to the 79th regiment of infantry in the British service, in consequence of the corps having been raised by Allan Cameron of Erroch in 1793. Originally, it consisted of 1000 men, but a second battalion was added in 1804. This gallant regiment, which wears the Highland garb, performed distinguished services in the Peninsula and at Waterloo, and in the chief warlike struggles of more recent times.

CAMERONIAN REGIMENT, the 26th regiment of infantry in the British service, so called from having had its origin in a body of Cameronians (q.v.) during the revolution of 1688. Taking advantage of their zeal and courage, the convention which sat at Edinburgh induced a number of them to assist in the revolution, which it was imagined by some was to re-establish the reign of the covenants. They were induced to enlist on the understanding that the special object of the corps was "to recover and establish the work of reformation in Scotland, in opposition to popery, prelacy, and arbitrary power, in all the branches and steps thereof, till the government in church and state be brought to that luster and integrity which it had in the best of times." (See Burton's *History of Scotland*, vol. i. p. 49.) Thus was formed the celebrated C. R., with the youthful lord Angus as col., and William Cleland as lieutenant-col. and actual commander. Under Cleland, not yet in his 30th year, the regiment was sent northwards to quell the insurrection, after the fall of viscount Dundee. Surrounded by from 4000 to 5000 Highlanders, the Cameronians, only 800 strong, gallantly defended themselves during a whole day in Dunkeld, Aug. 21, 1689. In this terrific struggle, the brave Cleland was killed. Considering the issue of the revolution, they had been entrapped into military service, and their employment on foreign service afterwards greatly scandalized the Cameronian sect. The regiment has ever done credit to its origin; being distinguished alike for gallantry and for good conduct.

CAMERONIANS, the religious sect in Scotland popularly named after Richard Cameron (q.v.). Its official designation, however, is that of Reformed Presbyterians. No doubt, the principles of the body are those for which Cameron contended and died; but not till after 1688 did the small body of Presbyterians, who insisted upon the restoration of the civil and ecclesiastical polity of 1638 to 1649 in opposition to the revolution settlement, assume a distinct form. According to the solemn league and covenant, ratified by the parliaments of England and Scotland, and also by the assembly of divines at Westminster in 1643, presbyterianism was to be maintained in the kingdoms of England, Scotland, and Ireland, and popery, prelacy, superstition, heresy, schism, etc., were to be extirpated. As a measure of pacification, presbyterianism was established in Scotland by act of parliament, 1690; but it was of a modified kind, rendering the church a creature of the state, more particularly as regards the calling of general assemblies. Equally to the disgust of the extreme party referred to, prelacy was confirmed in England and Ireland, and there was a general toleration of heresy—i.e., dissent. In sentiment, if not in form, therefore, this party repudiated the government of William III. and his successors, and maintained the perpetually binding obligations of the covenants. Unquestionably, these C. acted under strong convictions, and only desired to carry out to a legitimate issue theoretical principles of the church of Scotland which, for prudential considerations, have been practically in abeyance; and it is in the standards of this sect that we find a true embodiment of the tenets held by the great body of English and Scotch Presbyterians of 1643. Although thus an elder sister of the existing church of Scotland and all its secessions, it was with some difficulty that, after the revolution, it organized a communion with ordained ministers. The steadfastness of members was put to a severe trial by the defection of their ministers; but in 1706, after their faith and patience had been tried for 16 years, they were joined by the Rev. John M'Millan, from the Established church; and shortly afterwards, by the Rev. John M'Neil, a licentiate of the same church. To confirm the faith of members, and give a public testimony of their principles, the covenants were solemnly renewed on Auchensauch hill, near Douglas, in Lanarkshire, in 1712. The subsequent accession of the Rev. Mr. Nairne enabled the C. to constitute a presbytery at Braehead, in the parish of Carnwath, on the 1st of Aug., 1743, under the appellation of the Reformed presbytery. Other preachers afterwards attached themselves to the sect, which continued to flourish obscurely in the w. of Scotland and n. of Ireland. For their history and tenets, we refer to the *Testimony of the Reformed Presbyterian Church* (Glasgow, John Keith, 1842). Holding strictly to the covenants, and in theory rejecting the revolution settlement, the political position of the C. is very peculiar, as they refuse to recognize any laws or institutions which they conceive to be inimical to those of the kingdom of Christ; from which cause many of them formerly isolated themselves from general society, and refused several of the responsibilities and privileges of citizens. In 1860, there was an attempt on the part of some of the kirk-sessions to prevent the members becoming volunteers, on account of the oath of allegiance which required to be taken. On the question coming before the synod, it was decided (1863) that excommunication for taking the oath should cease. In consequence of this decision, 10 or 12 congregations seceded. In 1876, the larger body of the Reformed Presbyterians, consisting of about 45 congre-

gations, was formally united to the Free Church of Scotland, so that the distinctive features of the Cameronians are now represented by the few congregations which seceded in 1863.

CAMERONITES, a sect in France, followers of John Cameron of Scotland. They are moderate Calvinists, and assert that the will of man is determined only by the practical judgment of the mind; that the cause of men's doing good or evil proceeds from the knowledge that God infuses into them; and that God does not move the will physically, but only morally, by virtue of its dependence on the mind. This peculiar doctrine of grace and free-will was adopted by many eminent teachers who thought Calvin's doctrine too harsh.

CAMEROON, a German protectorate on the west coast of Africa, extending 199 miles along the coast of the bight of Biafra, between the Campo river and the Rio del Rey. It is a fertile region, and among its commercial products in 1895 were caoutchouc, palm oil, ivory, ebony, and cacao. The natives belong to the Bantu race (q. v.), and an attempt made in 1884 by the kings of the coast tribes to prevent the tribes of the interior from trading directly with Europeans led to an appeal to England and then to Germany, which forthwith annexed the country. Estimated area, 191,130 sq. m.; pop. 3,500,000, of whom 230 were whites in 1895.

CAMEROON, a river of Upper Guinea, Africa, which enters the bight of Biafra from a n.e. direction, in about lat. 4° n., long. 9° 40' e., by an estuary some 20 m. in breadth. For 40 m. upwards its breadth averages nearly a quarter of a mile, its depth varying in the dry season from 2 to 20 feet.

CAMEROONS' are mountains on the w. coast of Africa between 3° 57' and 4° 25' n., and 9° and 9° 30' e.; a volcanic mass covering 700 sq.m., the highest about 13,700 feet. They touch the gulf of Guinea on the w. and south. Capt. Burton ascended these mountains in 1861, finding the sides for about 4000 ft. covered with a dense growth of palms, acacias, figs, cardamoms, cabbage-trees, oaks, ferns, and bamboos. Higher up were smaller trees, and at 4580 ft. there began a labyrinth of lava streams and fields of slag. At about 8000 ft., craters appeared, of which there are nearly 30. The natives tell of an eruption in 1838.

CAME'TA, a t. of Brazil, on the Tocantins, which joins the estuary of the Amazon from the south. It has a fertile district attached to it, which is estimated to contain 20,000 inhabitants.

CAMILLA, in Roman fable, a virgin wonderfully swift of foot who aided Turnus against Æneas. She was said to be a daughter of king Metalus.

CAMILLUS, MARCUS FURIUS, a celebrated Roman patrician who first makes his appearance as consular tribune, 403 B.C. His military career was a series of unbroken successes, according to the accounts which have come down to us; but these accounts have been shown by Niebuhr to possess a considerable admixture of mythological or poetic fiction. In 396, C. was made dictator, during the Veientine war, in which he mined and captured the city of Veii; but the proud splendor of his subsequent triumph offended the Roman populace, who were still further displeased when C. demanded a tithe of the spoils of Veii, in order to fulfill a vow made to Apollo, on condition of victory. In 394, C. was again elected consular tribune, and besieged the Falerii, who after bravely defending themselves, were led by a magnanimous act of C. to yield unconditionally. Afterwards, C., being accused of peculation, and foreseeing certain condemnation, banished himself from Rome, 391, and lived in retirement at Ardea, until Brennus, at the head of his wild Gauls, had swept through Etruria, and captured and destroyed the whole of Rome except the capitol. C. was now recalled, and appointed dictator a second time. He achieved a decisive victory over the invaders, rebuilt Rome, and obtained new victories over the Volsci, and others. In 386 B.C., he was elected dictator for the third time, but refused the office. In 381 B.C., C. was victorious in the war of Rome against Præneste and other Latin towns; and in 368 B.C., he was elected to his fourth dictatorship, but abdicated during the same year. In 367 B.C., when war broke out with the Gauls, C., though 80 years old, accepted the dictatorship for the fifth time, defeated the barbarians near Alba, and made peace between patricians and plebeians. After this, he erected near the capitol a temple to Concord, and, having retired from public life, died 365 B.C., of the plague, lamented by the whole Roman people.

CAMILLUS and **CAMILLA**, applied in ancient Rome to the boys and girls who shared in sacrificial ceremonies. If they were designed for the priesthood, it was necessary that their parents should be still living and free-born.

CAMINATZIN', or CACUMAZIN, d. 1521; king of Mexico; nephew of Montezuma. He was one of the victims of the treachery of Cortes, against whom he had declared war. At the instigation of Cortes, Montezuma invited his nephew to the city of Mexico to make a reconciliation with the invaders. He replied that he would enter that city only to destroy the enemies of the country. Still influenced by Cortes, Montezuma had the young prince seized, but his captors permitted Cortes to get possession of him, and he was kept a prisoner until the expulsion of the Spaniards. He probably died soon after the siege of Mexico.

CAMISARDS, the name given to the peasantry of the Cevennes, a mountainous region in s. France, who for several years from 1702 kept up an organized military resistance to the *dragonnades*, or conversion by torture, death, and confiscation of property, by which, after the revocation of the edict of Nantes, the Roman Catholic leaders endeavored to enforce their authority in all the Huguenot districts. The name is of doubtful origin; some say it was from *camise*, a white shirt or frock, outwardly worn by the peasants; others that it was from *camisade*, a night attack; and still others, from *camis*, a road runner. The C. were also called *barbets* (or water dogs, a term also applied to the Vaudois), *vagabonds*, *assemblers* (a name given to a meeting or convention of Huguenots), *fanatics*, and *children of God*. They belonged to the romance-speaking people of Gothic descent, who took part in the earliest movements towards religious reform. It was in Languedoc that the peace of God and the mercy of God were formed in the 11th c. against the miseries of private war. There were long preserved the forms of municipal freedom, which nearly all Europe had lost; and there commerce flourished without spoiling the thrift, the patience, or the simplicity of the national character. Calvin was warmly welcomed when he preached at Nîmes, and Montpellier became the chief centre for the instruction of Huguenot youth; but it was in the triangular mountainous plateau called Cevennes, and there chiefly among the small farmers, the cloth and silk weavers, and the vine-dressers, that Protestantism was most universal and intense. The people were, and still are, very poor; but they are intelligent and pious, and add to the deep fervor of the Provençal character a gravity that is probably the result of the trials and sufferings of their ancestors.

To understand the position of the C. in the war which began at the commencement of the 18th c. it is necessary to glance at the preceding history of France. The system of toleration which was established by the edict of Nantes (q.v.), April 13, 1598, and the edict of Grace, July, 1629, was essentially a political compromise, and not a recognition of religious equality. The right of having a private chapel was given to certain seigneurs. New public churches were to be authorized at a certain rate in certain places. On the other hand, Calvinists were admitted to all public posts and to all professions; and they could publish books in towns where they had churches. The chamber of edict was formed in the parliament of Paris for the impartial judgment of cases brought by Huguenots; and the half-Catholic, half-Protestant constitution was adopted in the town consulates and the local parliaments of the south. After the short struggle between Louis XIII. and the duc de Rohan, the Huguenots settled down into contented industry; the army and navy of France were led by two Huguenots—Turenne and Duquesne—and Cardinal Bentivoglio wrote to the pope that he no longer found in France the insane fervor for right of conscience so radical among the Huguenots. But the court in which Mme. de Maintenon had succeeded to Mme. de Montespan, where Louvois, and the Jesuit, Père la Chaise, were as supreme as Bossuet and Flechier in the church, could not long be satisfied with tolerated heresy, which they chose to consider as veiled rebellion. On the death of Mazarin a commissioner had gone over the kingdom to inquire into the titles, or rather to suppress as many as possible, of the Huguenot churches, schools, and cemeteries. The extirpation of heresy had indeed been provided for by a clause in the marriage contract between Louis and Maria Theresa as long before as 1660, and in spite of the protection of Colbert, a policy was begun of gradually destroying the privileges of dissenters. They were shut out from public offices and trade corporations; they were forbidden to marry with Roman Catholics, and the conversion of their children seven years old and upward was encouraged and almost enforced. The famous edict came in Oct., 1685. It directed all dissenting churches to be destroyed, forbade their religious meetings under pain of imprisonment and confiscation of property, ordered all pastors who would not change their faith to be banished within fifteen days and to stop preaching at once, promised exemption from taxes and increased salaries to converted ministers, suppressed Huguenot schools and directed all children to be baptized and brought up in the Roman Catholic faith, prohibited all Huguenots except ministers from going abroad, and declared the property of those who had already gone to be forfeited unless they returned within four months. These were the main points of the edict revoking the liberal edict of Nantes. In carrying it out Huguenot Bibles and books of instruction were burned, and Huguenots were forbidden to hire themselves as artisans or as domestic servants. Torture, hangings, insults worse than death to women, the galleys, and imprisonment for life were the ordinary occurrences of the next sixty years. In the twenty years preceding the revocation, it is believed that 400,000 Protestants fled from France, and that 600,000 escaped in the twenty years that followed. But in the Cevennes the people were too poor to escape, and all over Languedoc began the secret meetings of the church of the desert. At last Louvois, the sanguinary war minister of Louis XIV., proposed that this district should be made an actual desert. An army of 40,000 was raised, and forts were erected at Nîmes, St. Hippolyte, Alais, and Anduze. The abbé du Chaila, a Roman Catholic missionary from Siam, had been appointed inspector of missions in the Cevennes. He introduced the "squeezers" (an instrument of torture which resembled the Scotch "boot"), and his cruelty at last broke the patience of the victims. His assassination, July 23, 1702, was the first blow in the war. There was to have been a general massacre of

Roman Catholic priests, but the plan failed, and the originator, Esprit Seguer, soon fell. He was succeeded by La Porte, an old soldier, who, as his forces increased, assumed the title of "colonel of the children of God," and named his country the "camp of the eternal." His captains were selected from those on whom the prophetic influence had fallen, such as the forest-ranger, Castanet; the wool-carders, Conderc and Mazel; and the soldiers, Catinat, Joany, and Ravenel; but the most famous were Roland and Jean Cavalier, the baker's boy (see CAVALIER, JEAN). For three years the C. held out. Then there was sent against them an army of 60,000, among them an English brigade which had just returned from the persecution of the Vaudois. A policy of extermination was commenced, and in the upper Cevennes alone 466 villages were burned, and nearly the entire population put to the sword. In this bloody work the pope, Clement XI., assisted by issuing a bull against the "execrable race of the ancient Albigenses," promising remission of sins to the holy militia which was now formed among the Roman Catholic population under the name of cadets of the cross. The formidable force brought against them induced Cavalier to listen to proposals, and he finally assented to a surrender on being guaranteed liberty of conscience, the right of assembly outside of walled towns, the liberation of all his people then in durance, and the restitution to emigrants of their civil rights and property. Still, the greater part of the army, under Roland, Ravenel, and Joany, refused, and insisted upon the complete restoration of the edict of Nantes. They continued the war until the beginning of 1705, by which time their leaders were killed or dispersed and they became disorganized. In 1711 all outward signs of the reformed religion had disappeared, and Mar. 8, 1715, a few months before his death, Louis XIV., by a special medal and by proclamation announced the entire extinction of heresy. Fourteen years afterward, in spite of the strictest surveillance aided by military occupation, there had been organized in Languedoc 120 churches, which were attended by 200,000 Protestants. Persecution could not secure suppression, but it was not until 1775 that the last galley slave from Languedoc was liberated, and not till 1789 that the national assembly repealed all the penal laws against Protestantism.

There was a singular psychologic or spiritual phase in the history of the C. that must be noticed. It was a sort of inspiration or ecstasy. The subject, who had endured long fasting, became pale, and fell insensible to the ground. Then came violent agitations of the limbs and the head; and finally the patient, who might be a little child, a woman, or a half-witted person, began to speak in good French of the Huguenot Bible, warning the people to repentance, prophesying the immediate coming of the Lord in judgment, and claiming that these exhortations came directly from the Holy Ghost. After a long discourse the patient returned to his native patois with no recollection of what he had been doing or saying. All kinds of miracles, so they believed, attended upon the Camisards. Strange lights guided them to places of safety, unknown voices spoke encouragement, and wounds were often harmless. Those who were in the ecstasy of trance fell from trees without sustaining hurt; they shed tears of blood, and they subsisted without food for nine days. The supernatural was a part of their life. Many judgments have been passed upon these phenomena. Flechier and Brueys, Roman Catholics, consider them the product of fasting and vanity, nourished by apocalyptic literature. Bertrand and Calmeil, physicians, speak of magnetism, hysteria, and epilepsy, and a prophetic mania based on belief in divine possession. Most Protestants are content with the epithet "ecstasy," while semi-radical Roman Catholics consider the whole business the work of the devil. See Mrs. Bray's *Revolt of the Protestants of the Cevennes* (1870). See CEVENNES, GOD'S TRUCE.

CAMLET (from Arab *chamal*, fine) is properly a fabric made from the hair of the Angora goat (q.v.). The camlets made in Britain are either wholly of wool, or of wool mixed with cotton or linen, and spun hard.

CAM-MERHOFF, JOHN FREDERICK, 1721-51; b. in Germany, and one of the first Moravian bishops in America, where he arrived in 1746, as assistant to the bishop then presiding. He won the confidence of the Indians, with whom he was a great favorite. In 1750, he attended an important Iroquois council at Onondaga, N. Y., making a canoe journey of 13 days up the Susquehanna, and going thence on foot through the wilderness, an exertion which ruined his health.

CAMOËNS, LUIS DE, the epic poet of Portugal, was b. about 1524, at Lisbon, and studied the ancient classics at Coimbra. On his return to Lisbon, he fell in love with a lady of honor, Catharina d'Atayada. This affair was the beginning of all the poet's misfortunes. Having been banished by royal authority to Santarem, C. joined the expedition of John III. against Morocco, and lost his right eye in a naval engagement with the Moors in the strait of Gibraltar. On his return to Lisbon, his bravery as a soldier was no more honored than his genius as a poet. Disappointed in all his hopes, he determined to leave forever his native land, and sailed for India, 1553. Offended by certain abuses of the Portuguese authorities in India, C. ventured to expose them in a satire, entitled *Disparates na India*, "Follies in India," in which he treated even the viceroy with ridicule. For this offense the poet was banished, 1556, to Macao, where he lived several years, and was engaged in writing *Os Lusíadas*. Here C. held the unpoetical but probably lucrative post of administrator of the effects of deceased persons; and having

saved, as he thought, a competency for his future life, was recalled from his banishment, 1561. Unhappily, in returning to Goa, he suffered shipwreck, and lost all his property, excepting his epic poem. After other wanderings and misfortunes, C. took ship for Lisbon, where he arrived in 1569, with no other wealth but his epic. He dedicated *The Lusiad* to the young king, Sebastian, who was very gracious; but, nevertheless, all the real patronage bestowed on C. consisted of a very small pension (about £4), and permission to remain at the court of Lisbon. Even this small pittance was taken away after the death of Sebastian, and C. was left in such poverty, that a faithful Indian servant begged in the streets of Lisbon for the support of the great epic poet of Portugal. C.'s lyric poems, written during this time of destitution, contain many pathetic lamentations. He died obscurely in the hospital at Lisbon, 1579; and 16 years afterwards, when it was proposed to erect a splendid monument to his memory, there was some difficulty in finding his burial-place.

The Lusiad (*Os Lusíadas*, "the Lusitanians") celebrates the chief events in the history of Portugal, and is remarkable as the only modern epic poem which is pervaded by anything like the true national and popular spirit of ancient epic poems. It is a gallery of epic pictures, in which all the great achievements of Portuguese heroism are represented. Among the most famous passages are the tragical story of Inez de Castro, and the apparition of the giant Adamastor, who appears as the Spirit of the Storm to Vasco da Gama, when crossing the cape. The versification of *The Lusiad* is extremely charming. Patriotic sentiments pervade the whole work. Besides his epic poem, C. wrote sonnets, odes, elegies, eclogues, epigrams, satires, epistles, and three comedies—*Os Amphitryões* (after Plautus), *King Seleucus*, and *Filodemo*. The latest and best complete edition of his poems appeared in three volumes (Hamburg, 1834). The best edition of *The Lusiad* was published in Paris (1817), reprinted in 1819, and again, with emendations by Berdier, in 1823. *The Lusiad* has been translated into Spanish, French, Italian, English, Polish, and German. See Burton, *Camões; his Life and his Lusiad* (1882); and a life by Storek (1890).

CAMOGLI, a t. of n. Italy, on the gulf of Genoa, about 13 m. e.s.e. of the city of that name. Its inhabitants, amounting to about 9000, are chiefly engaged in fishing.

CAM'OMILE. See CHAMOMILE.

CAMOR'RA, the name of a secret society, existing throughout all parts of the former kingdom of Naples, the members of which are called *camorristi*, and have exercised lawless force to a great extent over the humbler classes of society. Under the Bourbons, they openly presented themselves at markets, hackney-coach stations, public spectacles, and all occasions of popular amusement; assumed the right of deciding disputes; extorted a portion of whatever money passed from hand to hand for purchases, rents, wages, and the like, or in games; undertook also the transport of smuggled goods; and contracted for the commission of serious crimes. Their readiness for violence and murder, and their close association among themselves, made them so much dreaded, that even camorristi who had been thrown into prison, succeeded in exacting money from their fellow-prisoners, and from the jailer himself. The society has a central rendezvous in every large provincial town, and twelve such in the city of Naples. Those who belong to each of these sections of the society are under the absolute government of a chief elected by themselves, with whom is associated a treasurer. The latter has the charge of the common fund into which all the camorristi of that section pay their whole gains, for equal distribution among all their associates. Candidates for membership must show that they have neither been guilty of espionage nor theft; also, that neither their wives nor their sisters are prostitutes; and must swear upon an iron crucifix a fearful oath of fidelity and secrecy. The candidate remains for a year, with the designation of *picciotto d'onore*, as a pupil under an old camorrista; and having completed this probation, and given proof of his courage and obedience in circumstances involving danger of life, he is advanced to the rank of a *picciotto di sgarro*. Finally, after a longer period, and when he has given proof of his fitness on a number of occasions, he is admitted to full membership of the society as a *camorrista*. Each camorrista carries about with him two knives of peculiar form, by which the members of the society recognize each other. They are held under the strictest discipline. Disobedience is punished by flogging, suspension from employment, or expulsion; treachery, even on the part of a member who has been expelled, is punished with death. If two camorristi quarrel, their chief decides the question between them; but in difficult cases, a duel with daggers is the mode of decision. Under king Ferdinand II. the C. was tolerated for political reasons. The government of Francis II. endeavored to put down the society, and the police received instructions to seize and transport all known members of it. Those who remained entered into alliance with the Garibaldi committee, and rendered essential service in the expulsion of the Bourbons. An attempt was now made to employ them in the police service, but completely failed. The C. having fallen out with the new government, the members of the society now chiefly live by robbery in s. Italy.—See **MAFFIA**, **CARBONARI**.

CAMOUFLET, in military pyrotechny, is a stinking composition inclosed in paper-cases. It is used in siege-works, to blow into the faces of the sappers and miners, when hostile parties come within reach of each other, and thus to confuse them.

CAMP (Fr., from Lat. *campus*, a plain, or level field). The signification of this word in English is rather that which belonged to the Latin *castrum*, an encampment, or *castra*, a collection of tents, huts, and other structures, for the accommodation and protection of troops, than that which its etymology would more directly indicate. The regular system of encampment ultimately adopted by the Romans, was forced upon them by degrees. The most complete account of it is furnished to us by Polybius. A plan will be found in Dr. Smith's *Dictionary of Greek and Roman Antiquities*, constructed for the purpose of illustrating his description. When a Roman army was about to encamp, a tribune and several centurions were sent on before, to select a suitable site for the purpose. As soon as the locality was determined on, they chose the spot for the prætorium or general's tent, and marked it with a white flag. Around the prætorium, as a sort of center or heart to the whole system, the rest of the C. was laid out. It was generally placed on an elevated position, in order that the general might have the rest of the encampment under his eye, and be able to transmit his orders with greater facility. Polybius himself tells us, that the best conception which can be formed of a Roman C. of the more permanent kind is by regarding it as a military town, resembling in many respects no doubt that which has recently grown up at Aldershot (q.v.). The streets were broader than those usually to be found in towns, the wider ones measuring 100, and the narrower 50 ft.; and the *forum*, as its name indicates, was a sort of public market-place. A space of 200 ft. was left vacant all round between the tents and the ramparts, partly to afford space for the arrangements of the army, and for stowing away any booty that might be captured, but chiefly to protect the soldiers' huts from incendiary attempts from without. In form, the Roman C. was square, except in the case in which it was intended to embrace within its ramparts four legions, or two consular armies, when it became an oblong rectangle. The C. was surrounded by a fosse or trench (*fossa*), which was generally 9 ft. deep and 12 broad. On the top of the rampart, which was of earth, there were stakes. The labor of constructing the rampart and the fosse was divided between the allies and the Roman legions, the former making the sides along which they were stationed, and the legions the rest. The task of superintending the construction of the C. amongst the Romans was intrusted to the tribunes; amongst the allies, to the prefects. Before the arrival of the troops, the different parts of the C. were so distinctly marked out and measured off, that they at once proceeded to their respective stations, as if they had entered a well-known city, and were marching to their quarters. The discipline of the C. was of the strictest kind. The tribunes administered an oath against theft both to freemen and slaves, and two maniples were chosen to keep the *via principalis*, which was a place of general resort, clean and in good repair. The other occupations connected with the C., too numerous to be mentioned here, were portioned out in like manner; and the superintendence of the whole was intrusted to two tribunes chosen by lot from each legion, and appointed to serve for two months. The prefects of the allies possessed a similar authority, which, however, seems to have been limited to their own troops. Every morning at daybreak, the centurions and horsemen presented themselves to the tribunes, and these, in their turn, received their orders from the consul. The watchword for the night, marked on a four-cornered piece of wood, was given out with much formality. The night was divided into four watches, each of three hours' length; and there was a curious arrangement for ascertaining that guard was kept with vigilance. The soldiers of the watch companies received from the tribune a number of small tablets, with certain marks upon them, and these tablets were collected during the night by the horsemen whose duty it was to visit the posts, from such of the guards as they found on duty. Where these inspectors found the guards asleep or absent, they called upon the bystanders to witness the fact, and then passed on to the next. In the morning, the inspectors appeared before the tribunes, and gave up the tablets they had received, when the guards whose tablets were not produced were required to account for them. A regular scale of rewards and punishments was established in the camp. In comparing the encampments of the Romans with those of his own countrymen, Polybius tells us that the Greeks trusted mainly to a judicious selection of their ground, and regarded the natural advantages which they thus secured as supplying in a great measure the place of artificial means of defense. The Greeks, consequently, had no regular form of C., and no fixed places were assigned to the different divisions of the army. When the practice of drawing up the army according to cohorts, introduced by Marius and Cæsar, was adopted, the internal arrangements of the C. experienced a corresponding change. Latterly, even the square form was abandoned, and the C. was made to suit the nature of the ground. It was always held to be of importance, however, that the C. occupied a defensible position; that it could not be overlooked; and that it had a command of water.

When stationary camps (*castra stativa*) came into more general use, we hear of several parts which are not mentioned by Polybius, for example, the infirmary (*veterinariûm*), the farriery (*veterinariûm*), the forge (*fabrica*), etc.; and as a great variety of troops then came to be employed, they must, of course, have had new stations appointed to them in the camp. Many of the stationary camps ultimately became towns, and to this is ascribed the origin of most of the towns in England the names of which end in *cester* or *chester*. Amongst the most perfect of those which retained the form of the simple

encampment, is that at Ardoch in Strathearn, Perthshire, in the grass-covered mounds and ridges of which most of the divisions of the C. have been distinctly traced by antiquaries.

It is believed that, during the middle ages, the plan adopted by the Romans in their camps was more or less adhered to, seeing that the weapons employed, which mainly determined the character of the troops, were nearly the same. In Britain, before the arrival of the Romans, and also during the Saxon and Danish periods, the camps, usually circular in form, appear to have been somewhat rude in character, with the cavalry grouped round the standard in the center, and the infantry placed near the front.

The principles of castrametation, or camp-formation, underwent much change after the invention of gunpowder, owing to the necessity for defending the C. from artillery. Permanent camps are in use by several modern armies, as at Aldershot (q.v.) and at Châlons-sur-Marne.

CAMP, a co. in n.e. Texas; formed 1874; drained on w. by Big Cypress Bayou; surface well covered with oaks and pines; soil productive. Area, 200 sq.m. Pop. '90, 6624, inclu. colored. Co. seat, Pittsburg.

CAMPAGNA, a t. of Italy, in the province of Salerno, is situated between high mountains, about 20 m. e. of Salerno. It has a fine cathedral, several convents, and a large annual fair. Pop. about 9000.

CAMPAGNA DI ROMA, an undulating, uncultivated, and unhealthy plain of Italy surrounding Rome, including the greatest part of ancient *Latium*, and forming the late papal delegation of Frosinone and a great part of the Comarca di Roma. Its length is variously stated, arising from the fact that different authorities measure it from different points. But supposing the name to apply to the district extending from cape Lınaro, s. of Civita Vecchia, to Terracina, beyond the Pontine marshes, its length is about 90 m.; and its breadth inland, to the Alban and Sabine hills, is stated at from 27 to 40 miles. A broad strip of sandy plain skirts the Mediterranean. The ground, which never rises above 200 ft. above the sea, is almost entirely volcanic, and the lakes are formed by craters of extinct volcanoes. The vapors rising from this district, and especially from the Solfatara (q.v.), produce the pestilential atmosphere styled *aria cattiva*. The number of inhabitants is very small, and in summer they are driven from the C. by its pestilent air, and seek shelter in Rome and other neighboring places. In autumn, herdsmen descend from the Apennines to the C. with their herds, the pasturage in some parts being rich and abundant. This district was not always uncultivated and depopulated as we now find it, for Domitian and Hadrian built here their splendid villas. Wars and devastations, the "black-death" (q.v.) in the 14th c., which greatly thinned the population, and inundations from the Tiber, have been the main causes of the present state of the C.; but, according to Livy, it was always an unhealthy district, even when well cultivated. Some of the popes, especially Pius VI., have endeavored to drain the Pontine marshes, and, during the dominion of the French in Italy, gen. Miollis made great improvements in drainage, timber-planting, and cultivation in the Campagna. Since '68, the government has done much to reclaim the C. See Lanciani's *Ancient Rome in the light of Recent Excavation* (1888).

CAMPAIGN generally means a connected series of military operations, forming a distinct stage or step in a war. Under the old system of warfare, when armies kept the field only during the summer months, a C. was understood to include all that was done by an army from the time it took the field till it went again into winter-quarters. Now that winter is no longer allowed to arrest military operations, it is more difficult to say where one C. ends and another begins. Some writers make a C. include all the steps taken to accomplish some one immediate object.

CAMPAN, a t. in France, in the department of Hautes-Pyrénées, 18 m. s.e. of Tarbes; pop. about 2000. It is in a valley of the same name, on the Adour, and is noted for picturesque scenery, for a stalactite grotto, and marble quarries, along the road to Bagnères de Bigorre. Some of the finest of colored marbles, with green, flesh-colored, red, and white veins, are found here.

CAMPAN, JEANNE LOUISE HENRIETTE, reader to the daughters of Louis XV., was b. in Paris, Oct. 6, 1752. She was favored by Marie Antoinette, and gave her royal patroness numerous proofs of her fidelity. When the unfortunate queen was conveyed to the Temple, she wished to share her captivity, but was refused entrance by Petion. During the reign of terror, she remained concealed at Combertin. After the fall of Robespierre, she opened a boarding-school at St. Germain-en-Laye, which was patronized by Josephine Beauharnais, who sent her daughter Hortense to it. In 1806, Napoleon appointed her lady-superintendent of the institution at Ecouen for the education of the daughters of the officers of the legion of honor. After the restoration, this institution was suppressed, and Mme C. retired to Mantes, where she died, May 16, 1822. She is chiefly remembered on account of her interesting works—*Mémoires sur la Vie Privée de la Reine Marie Antoinette* (4 vols., 5th ed., Par. 1824); *Journal Anecdotique* (Par. 1824); and *Correspondance Inédite avec la Reine Hortense* (2 vols., Par. 1835)—giving recollections of the court of Louis XV., of Marie Antoinette, the revolution, and some traits from the private character of Napoleon.

CAMPANA, LA, a t. of Andalusia, Spain, situated on the Madre-Vieja, a tributary of the Guadalquivir, about 37 m. e.n.e. of Seville. The inhabitants, numbering about 5000, are engaged chiefly in agricultural pursuits, and in weaving and brick-making.

CAMPANA RIO, a t. of Estremadura, Spain, about 62 m. e.s.e. of Badajos. It is an ill-built place, with narrow, uncared-for streets. It has manufactures of linens and ropes, and a trade in the agricultural produce of the neighborhood. Pop. 7000.

CAMPANELLA, TOMMA'SO, a Dominican monk celebrated for his philosophical ability, was b. in 1568 at Stilo in Calabria, and studied in Naples and Cosenza. The writings of Telesius first awakened his doubts respecting that pile of artificial dogmas styled the "scholastic philosophy." The results of his studies were given in his *Philosophia Sensibus Demonstrata*, etc. (Naples, 1591), which contained a defense of Telesius. His superiority in disquisitions exposed him to the hatred and false accusations of the orthodox monks and schoolmen. He was in consequence compelled to flee from Naples to Rome, and thence to Florence, Venice, and Bologna. Afterwards, he returned to Calabria, but having involved himself in a political conspiracy, he was seized and confined in a Neapolitan dungeon for 27 years; tried five times, and tortured seven; accused of heresy; and declared the author of a book which had been published thirty years before he was born. In 1626, pope Urban VIII. had him brought to the prison of the inquisition at Rome, but immediately liberated him, and treated him in a very generous manner. After being again persecuted by the Spanish government, C., who had formed the friendship of the French ambassador at Rome, the duc de Noailles, obtained a letter of introduction to cardinal Richelieu, and secretly left for France, where he was graciously received. He died in the Dominican monastery of St. Honoré, near Paris, 1639. Most of his works—*De Gentilismo non Retinendo* (Paris, 1636); *Astrologicorum Libri VII.* (Lyons, 1629); *Prodromus Philosophiæ Instaurandæ* (Frankfort, 1617); *Exordium Metaphysicæ Novæ, De Sensu Rerum et Magia* (Frankfort, 1620)—were written during his imprisonment. His philosophical views give expression to that confused fermentation of new ideas which was characteristic of the close of the 16th and opening of the 17th c.—bold and clear opinions strangely mingled with commonplaces and with astrological dreams and fancies. It may seem strange that C. should have been patronized by the pope; but this favor was gained, not by his speculative works, but by several writings in defense of the Roman Catholic church. His *De Monarchia Hispanica Discursus* is a work of great power and value, comprising a sketch of the political world of C.'s time, with special reference to Spain. It was translated into English during Cromwell's protectorate. See *Life* by Baldacchini (1840), and by Amabile (1883).

CAMPAN'HA, a t. of Brazil, about 150 m. n.w. of Rio de Janeiro, surrounded by bare hills, much cut up by gold-mines. The houses are built chiefly of earth, and surrounded by gardens. C. has several churches, a Latin school, a hospital, theater, etc. Pop. 6,600.

CAMPANIA, anciently a province of central Italy, having Capua as its capital (now subdivided into the provinces of Benevento, Naples, Salerno, Avellino, and Caserta), was bounded on the s. by Lucania, e. by Samnium, n. by Latium, and w. by the Tyrrhenian sea. It was one of the most productive plains in the world, producing in extraordinary abundance corn, wine, and oil; and both by Greek and Roman writers is celebrated for its soft and genial climate, its landscapes, and its harbors. It was the *regio felix* of the Romans, who built here many of their most splendid villas, etc. Through it passed the Appian Way, the greatest high-road of Italy. The promontory Misenum, Mt. Vesuvius, the river Volturnus, the towns Baiæ, Cumæ, Linternum, Puteoli, Naples, Herculaneum, Pompeii, Nola, Salernum, Capua, etc., belonged to Campania. It was the oldest Greek settlement in Italy, having been colonized, according to the later chronologers, about 1050 B.C.; but this is in all probability too early a date. It was next conquered by the Etruscans, and several of the towns above mentioned, such as Capua and Nola, were founded by that people. The Etruscans then succumbed to the more warlike and hardy Samnites, who, in their turn, yielded to the irresistible valor of Rome (340 B.C.). Through all these vicissitudes of conquest, the substratum of the people remained as at the beginning. The mass of the Campanians were essentially of Oscan race, and Oscan they remained. Indeed, it is mainly from them that our knowledge of the Oscan language is derived, and one of their towns—Atella, between Capua and Naples—had the honor of introducing upon the early Roman stage a species of popular drama or comedy, which was greatly relished for its quaint and vigorous humor. See *ATELLANÆ*.

CAMPA'NI-ALIMENIS, MATTEO, an Italian philosopher and mechanician of the 17th century. He was a curate in Rome, but devoted his time mainly to scientific pursuits, constructing the object-glasses with which two of Saturn's satellites were discovered; making illuminated and noiseless clocks; and attempting to correct the variations of the pendulum due to temperature. He published a work on horology. Giuseppe, a younger brother, was also an optician and astronomer of some eminence.

CAMPANILE (Ital., from Mid. Lat. *campana*, a bell), a name adopted from the Italian to signify a bell-tower of the larger kind, and usually applied only to such as are

detached from the church. Scarcely any of the existing bell-towers of England answer to the Italian conception of the C., but it is said that there was a very fine one at Salisbury, 200 ft. in height, which was destroyed by Wyatt. In Italy, they are found everywhere—at Bologna, Padua, Ravenna, Cremona, Venice. Perhaps the most remarkable are the so-called "leaning tower" of Pisa, and the C. of Florence. The former, which is circular in form, is decorated with columns and arcades to the summit of its eight stories, and presents a very imposing appearance, reminding the traveler of the Coliseum at Rome, from which, and the now destroyed Septizonium, the idea of it is said to have been taken by the architects Bonano of Pisa, and Wilhelm of Innsbruck. But though less curious, the famous C. of Giotto is perhaps even more worthy of the traveler's attention. It was erected in 1334, with the express object of surpassing, both in height and in richness of workmanship, any of the remains of antiquity. In form, it is a parallelepiped, and is of the same dimensions from bottom to top. Though it is very lofty—267 ft.—it consists of only four stories, of which the tallest are the uppermost and undermost; and the windows in the upper story are rather larger than those in the two beneath, the object being to counteract the diminution to the eye occasioned by the greater distance. The effect of this arrangement has been much praised by architects; but there seems ground for skepticism as to its advantages. The style is the real Italian Gothic, which unites simplicity with great richness of ornamentation. The original design of Giotto was that a spire of 100 braccia in height should have surmounted the present structure, and on the summit may be seen the four great piers from which it was intended that it should have risen. The splendid C. of Florence, in its present condition, must thus be regarded only as a fragment. There is a fine C. at Seville, 350 ft. in height, which was built by Guever the Moor in 1568. It is called La Giralda, from a brazen figure, which, though it weighs a ton and a half, turns with the wind.

CAMPANI'NI, ITALO, b. Parma, 1846, an Italian tenor. He enlisted in the army of Garibaldi when fourteen years of age, and took part in the fight before Milazzo. Having discovered during the campaign that he had a wonderful voice, he studied singing for two years at the conservatory of Parma, and made his first appearance as the notary in *La Sonnambula* at one of the theaters of his native town. He sang with very little success with different opera companies till 1869. In that year he went to Milan and placed himself under the tuition of the celebrated teacher, Francesco Lamperti. After a thorough training he made his debut in *Faust* at La Scala of Milan, and was pronounced by a critical audience to be one of the finest tenors of the age. In 1872, he made his London debut as "Genaro," in *Lucrezia Borgia*, and in 1873 sang with Christine Nilsson in New York. He returned to America during the season of 1879-80. Besides his great successes he was remarkable for the immense scope of his repertory, which included nearly 80 operas, the tenor rôles of which he sang at short notice. He d. in 1896.

CAMPANULA (Lat., a little bell), a genus of plants of the natural order *campanulaceæ* (q.v.), distinguished by a bell-shaped corolla with five broad short segments, filaments dilated at the base, a 2 to 5 cleft stigma, and a top-shaped capsule with 2 to 5 cells, opening by lateral clefts below the calyx segments. The species are very numerous, chiefly but not exclusively abounding in the northern parts of the world, and the more elevated districts of the temperate zones. They are mostly herbaceous, some of them annual. The name BELL-FLOWER is common to many of them, and is often extended to all. The flowers are in general beautiful, and many of the species are therefore frequent ornaments of flower-borders. Of the native American species, the most common, and one of the most beautiful, is the harebell (q.v.), or BLUEBELL (*C. rotundifolia*). The CANTERBURY BELL (*C. medium*) is a very beautiful annual, which has long been so generally sown in flower-borders in Britain, that it is almost as familiar to every one as the most common field-flowers. It is a native of the central parts of Europe.—Medicinal virtues were formerly ascribed to some species, particularly in affections of the throat, wherefore *C. trachelium*, frequent in woods in England, has received the name of throatwort; but they are now regarded as inert.—The roots of some are reckoned among esculents, as those of the rampion (q.v.) (*C. rapunculus*).

CAMPANULACEÆ, a natural order of exogenous plants, herbaceous or half shrubby, with a bitter milky juice; leaves without stipules, and generally alternate; the calyx usually 5-lobed, its tube adhering to the ovary; the corolla monopetalous, inserted into the top of the calyx, usually 5-lobed and regular; the stamens inserted into the calyx, and alternate with the lobes of the corolla; the fruit with two or more many-seeded cells, crowned with the withered calyx and corolla, and opening by division of the cells (*loculicidally*); the seeds fixed to the axis, and having fleshy albumen. About 500 species are known, natives chiefly of the temperate and colder climates of the northern hemisphere, where their blue or white flowers are among the finest ornaments of fields and woods. The roots and young leaves of some species are eatable, as is the half-fleshy fruit of *canarina campanula*, a native of the Canary islands.

CAMPASPE, a river of Australia which flows north through Dalhousie county and joins the Murray at Echuca. The plains along its lower course support an agricultural population. Length, about 120 m.

CAMPBELL, a co. in n.w. Georgia, on the Chattahoochee river and the Atlanta and Westpoint railroad; 230 sq. m.; pop. '90, 9115, includ. colored. Among its minerals are gold and iron. Productions, corn, wheat, and cotton. Co. seat, Fairburn.

CAMPBELL, a co. in n. Kentucky, on the Ohio and Licking rivers; 140 sq. m.; pop. '90, 44,208, with colored. The surface is level in the bottom lands, and undulating away from the rivers; soil generally fertile, producing grain, tobacco, etc. Co. seat, Alexandria.

CAMPBELL, a co. in n.e. Tennessee, on the Kentucky border; watered by Clinch river; 488 sq. m.; pop. '90, 13,486, with colored. It has a rough surface, and is traversed by a spur of the Cumberland mountains, and is to a large extent covered with forests. It produces corn, wheat, and sugar. Co. seat, Jackboro.

CAMPBELL, a co. in S. Dakota; formed 1873. Area, 900 sq. m. Pop. 1890, 3510. Co. seat, Mound City.

CAMPBELL, a co. in s. Virginia, between James and Staunton rivers, intersected by the Norfolk and Western railroad; 465 sq. m.; pop. '90, 41,087, includ. colored. It has an uneven surface, and fertile soil; producing tobacco, corn, wheat, etc. Co. seat, Rustburg.

CAMPBELL, the family name of the lords of Argyll. See ARGYLE.

CAMPBELL, ALEXANDER, D.D., 1788-1866; b. in Ireland; educated at Glasgow university, and came to the United States in 1809, settling in Bethany, Va., as pastor of a Presbyterian church, from which he soon departed and organized a society whose doctrine was that the Bible should be the sole creed of the church. His followers increased, and are now known as "Disciples of Christ," or "Campbellites," and numbered (1896) 1,003,672. Dr. C. was the author of many works on religious subjects, and held important controversies with such disputants as Robert Owen, Archbishop Purcell, Rev. N. L. Rice, and Rev. Wm. McCalla. See DISCIPLES OF CHRIST.

CAMPBELL, ALLAN, born N. Y., 1815; a civil engineer who was prominent in the construction of the Harlem railroad, the Pacific railroad, and that from Callao to Lima, Peru, and was president of the Harlem railroad until succeeded by "Commodore" Vanderbilt. He was appointed commissioner of public works (N. Y.), 1876, and during 1883 was controller of the same city. In 1882 he was defeated as nominee of the Republicans and Independents for the office of mayor. He d. in 1894.

CAMPBELL, ARCHIBALD. See ARGYLE, DUKE OF.

CAMPBELL, BARTLEY, b. Allegheny City, Penn., 1843; began as a journalist; founded the *Evening Mail* in Pittsburg; started a monthly magazine in New Orleans; but the success of his first play, *Through Fire*, 1871, induced him to devote himself to dramatic authorship. He afterwards produced *Fate*, *Peril*, *The Virginians*, *My Partner*, *The Galley Slave*, *The White Slave*, etc. He d. 1888.

CAMPBELL, Sir COLIN, Lord CLYDE, one of the bravest soldiers and most distinguished generals of modern times, was born in Glasgow, in 1792. His father was a cabinet-maker, named John MacIver, but Colin assumed the name of Campbell, to gratify an uncle on the mother's side. He entered the army as an ensign in 1808; fought through the war in the Spanish peninsula with distinction, and took part in the expedition to the United States in 1814. In 1842, he attained the rank of col., and in the same year he was present at the attack on Chusan, in China, and for his services there received honorable mention in the *Gazette*. He next served in the Punjab, commanding the left at the battle of Chillianwallah. For his conduct in this battle, lord Gough awarded him the highest praise in his dispatch to the governor-general of India. He next commanded in the Peshawur district, with uniform success against the hill-tribes. On the breaking out of the Crimean war in 1854, he was appointed to the command of the Highland brigade, and took a prominent part at the battle of the Alma; and afterwards at Balaklava, where, with the 93d Highlanders, which he did not even form into square, he beat back the Russian cavalry, who were swooping down on the port, with its accumulation of shipping and stores. His services in this war were rewarded with promotion to the rank of maj.gen., and he was also created a knight grand cross of the order of the bath, and received the cross of the French legion of honor. He was appointed inspector-gen. of infantry, and in 1857, commander of the forces in India, then engaged in quelling the Indian mutiny, which by his energy and judgment was soon utterly subdued. One of the most notable characteristics of C.'s generalship, was the care he took of the lives of his men, all his victories being won with the minimum expenditure of the blood of his soldiers. For his exploits in India, C., in 1858, was created a peer of the realm, with the title of baron Clyde, and appointed a gen., the East India company granting him an annuity of £2000. C. arrived in Britain from India in 1860, and died Aug. 14, 1863. See *Life* by Gen. Shadwell (1881).

CAMPBELL, JAMES EDWIN, was born July 7th, 1843, at Middletown, O.: educated in the public schools; studied law; and in 1863 enlisted as gunner in the navy, serving with the Red River and Mississippi flotillas. In 1873 he was prosecuting attorney of Butler co.; was thrice elected to congress as a democrat (1882, 1884, 1886), and in 1889 Governor of Ohio, defeating Joseph B. Foraker. In 1891 he was defeated by William McKinley, Jr., and in 1895 by Asa S. Bushnell, on renomination.

CAMPBELL, JOHN (CAMPBELL), Lord, high chancellor of England, son of a minister of Cupar, in the co. of Fife, Scotland, was born in 1779. He was at first destined to follow his father's profession, and was sent, while still a mere boy, to the neighboring univer-

sity of St. Andrews. C. himself had no inclination for a clerical life, and when he had completed his studies in the faculty of arts, he left for London, being then about 19 years of age. He obtained employment on the staff of the *Morning Chronicle*, where, in due time, he was intrusted with the care of the theatrical criticism and the reports in the house of commons. He was called to the bar in 1806. His sound sense, and unpretending activity and devotion to business, were awarded with an extensive common-law practice, and, after a time, with professional promotion. The silk-gown of a king's counsel was conferred upon him in 1827. Three years afterwards, he entered parliament, actuated, he tells us in the preface to one of his works, by a desire to obtain for England the benefits of a national registry of titles to land. The effort, at the time, was unavailing, as the landlords, whom it was destined more immediately to benefit, completely misunderstood the purport of the project. C. was promoted by the Whig party, to which he had attached himself, to the solicitor-generalship in 1832, and to the attorney-generalship in 1834. In the same year, he was chosen the representative in parliament for Edinburgh. He continued to represent Edinburgh down to 1841, and remained in the office of attorney-general during that period, with the exception of the short time in 1835, when the conservatives were in power. In 1841, he was made chancellor of Ireland and a peer of the United Kingdom; but held the office of chancellor for only a few months, when the Melbourne cabinet left office, necessitating C. also to resign. For the first time since boyhood, he found himself without regular daily labor, and at the mature age of 60, set to work to win the literary fame which he professes always to have secretly coveted. His first publication was a collection of his speeches at the bar and in the house of commons. For three or four years after the publication of his speeches, C. was engaged in the preparation of the *Lives of the Chancellors*, the first series of which appeared in 1845. In 1846, he joined the Russell cabinet in the capacity of chancellor of the duchy of Lancaster. His ministerial duties were not sufficiently arduous to interrupt his literary labors, and he proceeded to complete the *Lives of the Chancellors*, and to publish a supplemental series of *Lives of the Chief-justices of England*. Both works have enjoyed great popularity, but leave no doubt that the author was more fitted for a practical lawyer than for a man of letters. C. returned to more congenial labors in 1850; he was then appointed to succeed Denman as chief-justice. He held the office for nine years, at the end of which he received the chancellorship of England. He d. June, 1861. His *Life* has been written by his daughter (1881).

CAMPBELL, THOMAS, a distinguished English poet, was b. in the city of Glasgow, 27th July, 1777. His father was a merchant, and the poet was the youngest of ten children. He was sent to the university of his native city, and remained there six years. During his collegiate course, he received several prizes, and was particularly distinguished for his knowledge of Greek literature. On leaving the university, C. went to reside as a tutor for a year in the island of Mull. The scenery of the w. Highlands made a deep impression on his mind, and to his abode in these grand and desolate regions were indebted for many of the touches of sublimity which occur in his verses. Returning from Argyllshire, C. meditated the study of law, and repaired to Edinburgh; but he could not shake off his recollections. In his eyes, the mists were folded on the hills of Morven, the roar of Corrievrekin was in his ears, and instead of prosecuting the study of jurisprudence, he wrote *The Pleasures of Hope*. The poem was published in 1799, and went through four editions in a twelvemonth. After its publication, C. went to the continent; and on Dec. 3, 1800, witnessed from a Bavarian monastery the battle of Hohenlinden, fought between the French and Austrians. In 1801, he returned to England with *The Exile of Erin* and *Ye Mariners of England* in his portmanteau; and shortly after, took up his abode in Edinburgh, where *Locheil's Warning* was composed. In 1803, C. proceeded to London, and adopted literature as a profession. He contributed articles to *The Edinburgh Encyclopædia* and compiled *The Annals of Great Britain from the Accession of George II. to the Peace of Amiens*, in 3 vols. In 1806, through the influence of Mr. Fox, C. received a pension of £200 per annum from government. In 1809, he published *Gertrude of Wyoming*, which bears the same relation to *The Pleasures of Hope* that *The Castle of Indolence* bears to *The Seasons*—a less brilliant and striking, but more mature and finished performance. In 1818, C. was again in Germany, and on his return, he published his *Specimens of the British Poets*, in 7 vols. In 1820, he delivered a course of lectures on poetry at the Surrey institution. From this date to 1830, C. edited *The New Monthly Magazine*, and contributed thereto several poems, one of which, *The Last Man*, is in some respects the loftiest of all his performances. In 1824, he published *Theodoric and other Poems*. In 1827, he was elected lord rector of the university of Glasgow, and received the unusual honor of re-election the two following years. He published *The Pilgrim of Glencoe and other Poems* in 1842. His later publications did not add to his fame. He died at Boulogne, in 1844, and was buried in Westminster abbey, Macaulay, Dean Milman, and other celebrated persons bearing the pall.

C. is an established English classic. With the young, *The Pleasures of Hope* will ever be a chief favorite; while readers of maturer years will linger with delight over the sylvan scenery and tender domestic scenes of *Gertrude*. It is in his lyrics, however, that C. has ascended highest into the heavens of song—*Hohenlinden*; *Ye Mariners of England*; and *The Battle of the Baltic*, cannot be paralleled in the language. Than these lyrics,

nothing can be more simple and spirited. Once read, they cannot be forgotten. They will fan the patriotism of many generations.

CAMPBELL, WILLIAM, 1745-81; b. in Va.; an officer in the revolutionary war. He was among the earliest of the patriot troops from that colony, and was distinguished in the conflicts of King's Mountain and Guilford, for which he was promoted to be brig. gen. He died in Lafayette's camp, just before the Yorktown surrender.

CAMPBELL, WILLIAM, Lord, d. 1778; the last English governor of South Carolina. He was a capt. in the navy; a member of parliament in 1764; in 1766, governor of Nova Scotia, and 1775, of South Carolina. He was active in stirring up the Indians against the colonists, and was in the expedition led by sir Peter Parker against South Carolina, in the course of which he received the wound that caused his death.

CAMPBELL ISLAND, a lonely spot on the s. Pacific, in lat. 52° 33' s., and long. 169° 9' e. Though it is mountainous, and measures only 36 m. round, it is yet valuable on account of its harbors. It is also scientifically interesting, being volcanic, and displaying a rich and rare flora.

CAMPBELLITES. See DISCIPLES OF CHRIST.

CAMPBELTOWN, a royal burgh and seaport, on the e. coast, near the s. end of the peninsula of Cantire, in Scotland, and the most important town in that co., is 65 m. w.s.w. of Glasgow, on a fine harbor or sea-loch, nearly 3 miles long, and 1 mile broad, and sheltered by Davarr Island. It unites with Ayr, Inverary, Irvine, and Oban to return one member to parliament. A sculptured granite cross stands in the principal street, and is supposed to have been brought from Iona. Pop. '91, 8235. There are many distilleries in the town and there is a coal mine in the vicinity. Its fisheries are important. C. is a favorite summer resort.

CAMPPE, JOACHIM HEINRICH, 1746-1818; a German teacher educated at Halle in theology, and chaplain at Potsdam. In 1787 he was counselor of education in Brunswick, where he published books for schools, and established a prosperous business. His works on education have been widely circulated, not only in German, but in other languages.

CAMPEACHY, one of the states of Mexico occupying the s. part of the peninsula of Yucatan, and bordering on Guatemala and the Belize; 18,087 sq. m.; pop. 1895, 90,458, of whom a large proportion are Indians. The soil is for the most part sandy and unproductive, but there are good pasture lands. The main productions are rice, sugar, and salt.

CAMPEACHY, a seaport on the w. side of the peninsula of Yucatan, which divides the Caribbean Sea from the Gulf of Mexico. It is in lat. 19° 50' n., and long. 90° 33' west. Though it has a shallow haven, yet it is the center of the trade in logwood; it exports likewise cotton and wax. It is a handsome city of 18,700 inhabitants, containing churches, convents, a cemetery, a theater, a college, and shipbuilding docks. *Campeche* is the Spanish spelling.

CAMPEGGIO, OR CAMPEGGI, LORENZO, 1472-1539; in early life a lawyer, but on losing his wife he joined the Roman Catholic church and rapidly rose to the position of cardinal. In 1519, he was sent to England to preach a crusade against the Turks, but was unsuccessful. Henry VIII. made him bishop of Salisbury in 1524, and he came again to England in 1528 to assist Wolsey in the case of Henry's divorce from Catherine. He accomplished nothing, however, and the see of Salisbury was taken from him.

CAMP EQUIPAGE is a general name for all the tents, furniture, fittings, and utensils carried with an army, applicable to the domestic rather than the warlike wants of the soldier. In the days when armor was worn, the C. E. was enormously heavy and complicated. In the present day, a certain amount of C. E. is provided for a given number of troops. See CAMP; TENT.

CAMPER, PETER, one of the most learned and acute physicians and anatomists of the 18th c., was born at Leyden, 11th May, 1722, and studied medicine there. In 1750, he became professor of medicine at Franeker; in 1755, at Amsterdam; and in 1765, at Groningen. In 1773, he resigned his post, resided some time at Franeker, and then traveled. On being elected a member of the state council in 1787, he removed to the Hague, where he died, 7th April, 1789. C. was distinguished not only for the services he rendered to anatomy, surgery, obstetrics, and medical jurisprudence, but also as a promoter of the fine arts. He was remarkably skillful in pen-and-ink drawing, painted in oil, embossed, and even acquired considerable experience as a sculptor. For his observations on the facial angle, see article ANGLE. His work on the connection of anatomy with the art of drawing was an important contribution to the theory of art. Another work, *Description Anatomique d'un Eléphant Mâle*, edited by his son, G. A. Camper, and published at Paris in 1802, is also worthy of notice. C.'s collected writings, with plates, appeared under the title, *Œuvres qui ont pour Objet l'Histoire Naturelle, la Physiologie et l'Anatomie comparée*, 3 vols. (Par. 1803).

CAMPERDOWN, a broad tract of low downs which separates the small hamlet of Camp, in North Holland, from the German ocean, about 30 m. n. from Haarlem. It is

known on account of the victory obtained, off that part of the coast, by Admiral Duncan over the Dutch fleet, Oct. 11, 1797. The Dutch fleet, under Admiral Van Winter had stolen out of the Texel, with the view of joining the French fleet at Brest, when it was intercepted by Admiral Duncan, and after an obstinate battle, attended with great loss, on both sides, the Dutch admiral was compelled to yield, leaving 8 sail of the line and several smaller vessels in the hands of the English, himself becoming a prisoner.

CAMP FOLLOWERS are the sutlers and dealers in small-wares who follow an army. In India, owing to the peculiar habits and customs of the Hindus, and the large number of servants retained by English officers, the C. F. are in immense number: comprising servants, sutlers, cantiniers, hostlers, water-carriers, snake-charmers, dancers, conjurors, and women. In Feb., 1839, when a Bengal army of 15,000 men left Shikarpoor for Afghanistan, it was accompanied by no fewer than 85,000 C. F.; the commander took with him six weeks' food for the whole 100,000. All English commanders in India find this regulation a very burdensome one. Even in European armies, however, C. F. are regarded as necessary; they are under the control of the commanding officer, and are subject to the articles of war—not, however, in cantonments, only in the field. French armies are accompanied by women much more largely than English.

CAMP HAUSEN, WILHELM, b. 1818; a German painter whose specialty was battle pieces, to qualify for which he served as a volunteer in the army. Among his works are "Tilly at Breitenfeld," "Prince Eugene at Belgrade," "Godfrey de Bouillon at Ascalon," "Puritans watching the Enemy," "A Convoy of Prisoners of Cromwell's Camp," "Cavaliers and Roundheads," "Storming of an English Castle by Cromwell's Soldiers," "Charles II. in the Retreat from Worcester," "Charles I. at Naseby," etc. In 1859 he was made professor of historical painting in the Düsseldorf academy. He d. in 1885.

CAMP HENE, or **CAMP HILENE**, is an artificial variety of camphor obtained from turpentine, by acting thereon with the dry vapor of hydrochloric acid, and keeping the whole at a low temperature by immersing the vessel in a freezing mixture. A solid substance is produced, which separates in white crystalline prisms, and has the taste and agreeable aromatic smell of common natural camphor. As prepared, it is strictly a hydrochlorate of C.; but the latter can be obtained free from hydrochloric acid, by passing the vapor of the compound substance over dry heated quicklime, when the acid is held by the lime, and pure C. passes over. It is not so similar to ordinary camphor when thus freed from the hydrochloric acid.

CAMP HINE is the name applied to a variety of spirit of turpentine obtained from the *pinus australis* of the southern states of America, and rather extensively sold and used in Britain for burning in out-of-door lamps. It is very volatile, and burns very freely, giving off a pure white brilliant light; and when the vapor diffuses itself through air, and is set fire to, it forms a dangerous and violently explosive mixture.

CAMP HORE is a solid essential oil which is found in many plants, and may be separated from many essential oils. It particularly abounds in certain species of the natural order *lauraceæ* (q.v.). Almost all the C. of commerce is the produce of the C. laurel or C. tree (*camphora officinarum*, formerly known as *laurus camphora*), a native of China, Japan, Formosa, and Cochin-China, and which has been introduced into Java and the West Indies. The genus *camphora* differs from *cinnamomum* (see CINNAMON) chiefly in having a thin instead of a leathery calyx. The C. laurel is a tree of considerable height, much branched, with lanceolate, evergreen leaves on short stalks, and small yellowish-white flowers in axillary and terminal panicles. The fruit is in size and appearance not unlike an imperfectly ripened black currant. Every part of the tree, but especially the flower, smells strongly of camphor. The wood is light and durable, not liable to be injured by insects, and much valued for carpenter's work. In the extraction of C. from the *C. laurel*, the wood of the stem and branches is chopped up into fragments, and introduced into a still with water, and heat applied, when the steam generated carries off the C. in vapor. These vapors rise, and in passing through rice-straw, with which the head of the still is filled, the C. solidifies, and is deposited round the straw in minute grains or particles, somewhat about the size of raw sugar or coarse sand. These grains of impure C. are detached, and being introduced into a large globular glass vessel in quantities of about 10 lbs., are reheated, when first the water rises in steam, and is allowed to escape at a small aperture; and thereafter, this aperture being closed, the C. sublimates and resolidifies in the interior upper part of the flask, as a semi-transparent cake, leaving all the impurities behind. The flasks are then cooled and broken by throwing cold water on them, and the C. taken out, and sent into market. The glass globes employed are called by an Italian name, *bomboloës*, the sublimation of C. having been first practiced in Venice.—C. was unknown to the Greeks and Romans, and was first brought to Europe by the Arabs. It is a white tough solid, slightly lighter than water, and floats thereon. It is very sparingly soluble in water, but freely soluble in alcohol, ether, acetic acid, and the essential oils. It fuses at 347°, and boils at 399°, and when set fire to, is very inflammable, and burns with a white smoky flame. Thrown upon water, it floats, and may be set fire to, when the currents generated alike from the solution in water and the irregular burning of the pieces, cause a curious rotatory motion. It has a peculiar hot aromatic taste, and an agreeable characteristic odor.

C. is used in medicine, both internally and externally, as a temporary stimulant. It is frequently employed in gout and rheumatism. In small doses, it acts as an anodyne and antispasmodic; in very large doses, it is an irritant poison. It is generally reckoned an anaphrodisiac. Its alcoholic solution and liniments in which it is the principal ingredient, are much used for external application in sprains and bruises, chilblains, chronic rheumatism, and paralysis.—The effluvia of C. are very noxious to insects, and it is therefore much used for preserving specimens in natural history.

The Borneo C. or Sumatra C. of commerce, sometimes called hard C., is the produce of *dryobalanops aromatica*, a large tree of the natural order *dipteraceæ* (q.v.). The C. is obtained by cutting down the tree, and splitting it into small pieces; being found in crystalline masses in natural cavities of the wood. To this substance, the Chinese ascribe extraordinary medicinal virtues, so that it is sold among them at more than 50 times the price of common camphor. It is seldom brought to Europe as an article of commerce.—The *dryobalanops aromatica* yields also a pale-yellowish limpid fluid, which gushes out when deep incisions are made in the tree with an axe, and which is generally called liquid C. or C. oil. It is sometimes imported into Europe. It has a smell somewhat resembling that of C., but more aromatic, like oil of cajeput. It is supposed to be from this fluid that the crystalline hard C. is deposited. See BORNEENE.

CAMP/HUYSEN, DIRK RAFAELSZ, 1586–1627; a Dutch painter, theologian, and poet. He made a translation of the Psalms, and wrote many short poems of merit; also several theological works, among which was a compendium of the doctrines of Socinius. His fame rests upon his work as a painter, which was more than ordinarily good.

CAMPI, a family of artists, who founded at Cremona, in the middle and near the close of the 16th c., an eclectic school of painting, parallel with that founded by the family Caracci (q.v.). Giulio C. (1500–72) was the head of the school. He studied painting, sculpture, and architecture under Giulio Romano. He also imitated the works of Titian (at least in coloring) and Pordenone with such success that his pictures have sometimes been ascribed to both of these artists. His female heads, like those of his brothers, are remarkably beautiful.—Antonio C. studied, under his brother, both painting and architecture. His knowledge of the latter was very serviceable in several of his paintings; for example, that of the sacristy of St. Peter. He was also a plastic artist, an engraver, and the historian of his native place.—Vincenzo C. (b. before 1532, d. 1591) seems to have followed the guidance of Antonio rather than that of Giulio, and excelled more in small figures than in large pictures. His paintings of fruits are highly valued.—Bernardino C. (b. 1522, d. about 1590), a kinsman of the three brothers C., was the most famous of the whole. Lanzi terms him “the Annibale Caracci” of the school. He studied first under Giulio C., but soon excelled his master. Afterwards, he chose Giulio Romano, Titian, and Correggio as models, but chiefly followed Raphael, yet without servile imitation. Many of his works are found in Milan and Cremona. In the latter place, the cupola of the choir in the church San-Gismondo is Bernardino's master-piece. He was distinguished as a portrait-painter and engraver. The lady-painter, Sophonisba Anguissola, was a distinguished pupil of Bernardino.

CAMP/IAN, or **CAMP/ION**, EDMUND, 1540–81; one of the few English Jesuits of celebrity; educated at Oxford; ordained deacon in 1567, but as he could not consent to the Protestant formulary as required by the English church, he went to Ireland and wrote a history of that country; and then to Douay, where he joined the society of Jesus. In 1580, he returned to England as a propagandist missionary. The next year he was charged with exciting the people to rebellion and holding treasonable correspondence with foreign powers, found guilty, and hanged at Tyburn, with several others of his order.

CAMPIDO/GLIO, PALAZZO DEL, a famous palace erected by Michael Angelo on the Capitoline hill, in Rome. It stands on the site of the ancient capitol.

CAMP/INAS, or **SAN CARLOS**, a t. of Brazil, in the province, and 70 m. n. of the city of Sao Paulo, is situated in a fertile and picturesque district, on a small river, the Piraticaba, a feeder of the Parana. There are large coffee and sugar plantations in the surrounding district, and large quantities of sugar are exported. Many of the houses are built of mud or clay, and the immense church, whose walls are 5 ft. thick, is composed of beaten earth. Pop. 18,000.

CAMP/ION. See LYNCHIS and SILENE.

CAMP-MEETING, a series of religious meetings held in the open air, usually in the woods, and participated in by families or groups of persons from a distance, who live in tents or in simply-built houses during the sessions and devote the greater part of the time to listening to preaching, which is always direct and fervent and is usually accompanied by a “revival.” The first held in the United States was in 1799, at a settlement on Red river in Kentucky, and was the outcome of the preaching of Rev. John M'Gee, a Methodist, his brother, a Presbyterian, and Rev. Mr. Hoge, also a Presbyterian, at a communion service. Their exhortations affected their audience so strongly, that crowds came from the surrounding country to hear confes-

sions and "testimonies," and the meeting, transferred from the small meeting-house to the adjoining forest, was protracted for several days, and was followed by others in different places. The number of persons attending one camp-meeting in Kentucky was estimated at 20,000. At first, Presbyterians and Baptists united with the Methodists in holding these meetings; but they soon came to be confined to the last-named denomination, which in all its branches has been most enthusiastic in supporting them and in introducing them into all parts of the country, though even within the denomination they have met with opposition. In many states camp-meetings have lost some of the characteristics of early days; the places of meeting being fixed, and the life less simple. Not unfrequently secular instruction is a feature; schools of languages, music, art, etc., and lectures on various topics, filling the time not occupied by religious services. Among the many popular camp-meeting grounds of the Methodist Episcopal church are Sing Sing, N. Y., Ocean Grove, N. J., Martha's Vineyard, Mass., Lakeside, O., Bartley, Neb., and Pacific Grove, Monterey, Cal.

Lorenzo Dow (q.v.) introduced camp-meetings into England in 1807, but the Wesleyan Conference refused (as it still does) to sanction them, and to this attitude was partly due the organization of the Primitive Methodist denomination in 1810. See *An Essay on Methodism* (N. Y., 1849) and Porter's *Camp-Meetings*.

CAMPOBAS/SO, a province in s. Italy, 1691 sq. m.; pop. est. '95, 382,181. The surface is almost wholly mountainous, the highest point being monte Miletto, 6,740 feet. Chief products, grain, wine, and vegetables. There are manufactories of steel and iron ware. The most important stream is the Biferno.

CAMPOBAS/SO, a fortified t. of s. Italy, in the province of the same name, about 53 m. n.n.e. of the city of Naples. The town stands on a slope of the monte Verde, in a cool, airy, and healthy region. It has a fine cathedral, a ruined castle, some convents, and palaces belonging to resident nobles. It has manufactures of cutlery, which have a considerable reputation for excellence. Its situation, though far from inviting as regards scenery, is favorable for trade, which is facilitated by good roads. Pop. '94, 15,800.

CAMPOBAS/SO, NICOLO, Count of, a soldier of fortune in the 15th c.; the son of a noble family whose estates were confiscated because he sided with Anjou in a war against Naples. He sold his services to Charles the Bold, but subsequently betrayed him, and was suspected of being concerned in Charles's death. Walter Scott depicted C. in *Anne of Geierstein*.

CAMPOBELLO, an island of New Brunswick, situated at the mouth of the Passamaquoddy Bay, in lat. 44° 57' n., and long. 66° 55' west. It is small, being 8 m. long, and from 1 to 3 m. broad; but it is decidedly valuable, possessing some good harbors, and, at its n. end, a light-house of 60 ft. in height. It contains copper and lead ores, but its inhabitants are chiefly engaged in the cod, herring and mackerel fisheries. It is a summer resort and has a fine hotel. Pop. 1200.

CAMPO DE CRIPTANA, a t. of Spain, in the province of, and about 50 m. n.e. of the city of Ciudad Real. It has manufactures of coarse cloths, and some trade in corn and fruits. Pop. 7200.

CAMPO-FORMIO, a village in the province of Udine, northern Italy, about 7 m. s.w. of the city of Udine, is celebrated for the treaty of peace here concluded, Oct. 17, 1797, between Austria and the French republic. After subjugating Italy (1796), the French army had crossed the Noric Alps, and threatened Vienna. Austria, therefore, hastened to arrange preliminaries of peace. In the treaty which was concluded by Bonaparte with the count of Coblenz, 17th Oct., 1797, Austria ceded the Netherlands, Milan, and Mantua, and received as compensation the districts Istria, Dalmatia, and the left bank of the Adige in the Venetian states, and the capital, Venice; while France took the remaining territory of Venice, its possessions in Albania, and the Ionian islands. In the secret articles of the treaty, Austria, in ceding the left bank of the Rhine, was to receive as compensation Salzburg and the Bavarian district on the Inn; and promises were held out to the duke of Modena, and other Italian houses, that their concessions should be compensated at the cost of Germany.

CAMPOMANES, PEDRO RODRIGUEZ, Count of, Spanish minister and director of the royal academy of history at Madrid, founded by Philip V. in 1738, was b. in Asturias in 1723. His talents and learning were devoted to the advancement of his native country. By his enlightened views of state policy, as well as by his writings, which ranked him among the most eminent Spanish authors, he obtained a great reputation throughout Europe. He gave effectual assistance to count Aranda in his difficult enterprise of driving the Jesuits out of Spain. He died Feb. 3, 1802. C.'s chief works are *Antigüedad Marítima de la República de Cartago con el Periplo de su general Hannón, traducido del Griego y ilustrado* (Madrid, 1756); *Discurso sobre el fomento de la industria popular* (1771); *Discurso sobre la Educación popular de los Artisanos y su fomento* (1775); *Apéndice a la Educación popular* (1775-77). These writings contained his opinions on politics, taxation, agriculture, manufactures, and commerce. The best known of his financial productions is *Tratado de la Regalía de Amortización* (Madrid, 1765).

CAMPOS, ARSENE MARTINEZ. See MARTINEZ-CAMPOS.

CAMPO SANTO, (holy field) is now the Italian designation for a cemetery or burying-ground, but more especially for an inclosed place of interment, surrounded internally by an arcade, for the burial of persons of distinction. See CEMETERY.

CAMPUS, in ancient Rome, a vacant space in or near a city, for public shows, combats, etc. There were eight around Rome, of which the C. Martius (camp of Mars) was the most important. It was outside the walls, occupying the level space between the Quirinal, Pincian, and Capitoline hills. In this met the *comitia centuriata* and the *comitia tributa*; and in it was the public hall for the use of the magistrates and foreign ambassadors, who were not permitted to enter the city. In later times it became a pleasure ground, with shaded walks, gardens, baths, theaters, and a race-course. Julius Cæsar built within it the marble halls for the comitia; Agrippa the baths and the pantheon; Augustus his own mausoleum; and Statilius Taurus the first stone amphitheater. Later emperors crowded this particular C. with public buildings and private residences. Under Aurelian it was taken in as a part of the city. The district in which the old C. was situated is now called Campo Marzo. Another ancient C. was the Sceleratus, the polluted field, where vestals who had been untrue to their vows of chastity were buried alive. The open grounds around modern colleges often bear the name of campus.

CAMPVERE, now called VERE, VEERE, or TER-VERE, a small fortified t. on the n.e. of the island of Walcheren, in the Netherlands province of Zeeland, 4 m. n.n.e. of Middelburg. It has a port on the Veersche Gat, which runs from the Sloe to the Roompot, separating Walcheren from North Beveland. The town has fallen into decay; but its former prosperity is indicated by the town-house of white freestone, with elegant tower, and the front ornamented by statues of several lords and ladies of the house of Borsselle; and by the large and beautiful cathedral church which is no longer used. C. owed its name to the ferry (Dutch, *veer*) existing from thence to the village of Campen, in North Beveland, the site of the present hamlet of Kamperland.

From a historical point of view, C. is a town of great interest. In 1304, it was the scene of a battle between William, governor of Holland and Zeeland, and Guy, count of Flanders, who was victorious. In 1572, the Spaniards were driven away; and a century later, C. was the first town which proclaimed William III., the prince of Orange, general stadtholder. It is chiefly interesting as the seat of a Scottish factory for three and a half centuries. Wolfaard van Borsselle, lord of C., having, in 1444, married a princess of the Stuart line, an impulse was given to the Scottish trade. A factory of merchants was formed, and by contract between the royal burghs of Scotland and the united provinces, C. became the only staple port. The goods could not be transferred to any other place until sold, merchants resorting thither to do business. The factors obtained many privileges, such as freedom from several duties and the right of being governed by the law of Scotland, having a lord conservator who was supreme judge in all matters. No factor might settle at C. without the written authority of the commissioners of royal burghs of Scotland, who took security for his honorable behavior. In 1795, the Batavian republic withdrew the privileges, and the factory was broken up, but the conservatorship was held as a sinecure long after the necessity for the office had ceased, the name of sir Alexander Ferrier appearing in the *Edinburgh Almanac* as "conservator at Campvere" so lately as 1847. The magistrates of C. were bound to provide a church for the factory, "to the end that the people of the Scottish nation be not frustrate of the Word of God and exercise of the reformed religion in their own proper language." The ministers were appointed by the commissioners of royal burghs, from 1613 to 1790, when the last appointment was made.

CAMTOOS, or GAMTOOS, a river of the e. division of the Cape Colony, of 200 m. in length. It rises in the Nieuwveld mountains, near lat. 32° s., and, flowing through the inland district of Beaufort, and the maritime one of Uitenhage, falls into that inlet of the sea which is immediately to the w. of Algoa bay. It is valuable as an aid to irrigation. For instance, Hankey, a station of the London missionary society on its banks, is thoroughly watered by means of a splendid tunnel carried through solid rock.

CAMUCCI'NI, VINCENZO, one of the most distinguished modern historical painters in Italy, was b. in Rome, 1775. The school of which he became the head was founded on the theatrical antique style of the French painter David. The first important works by C. were the "Assassination of Cæsar" and the "Death of Virginia;" both painted for lord Bristol at the commencement of the present century. His picture of "Unbelieving Thomas" was copied in mosaic for St. Peter's church. For the church of San Giovanni in Piacenza he executed a "Presentation in the Temple," which was greatly admired. These works were followed by many scenes from Roman history; among them, the pictures of "Horatius Cocles," and "Romulus and Remus" as children. C., who, as a man and an artist, was highly honored during his career, died at Rome, Sept. 2, 1844.

CAMUS, ARMAND GASTON, a prominent character in the French revolution, was b. in Paris, April 2, 1740. On account of his superior knowledge of ecclesiastical law, he was elected advocate-general of the French clergy. He was a zealous and ascetic Jansenist, and possessed of extraordinary firmness of character. He hailed the movements of 1789 with joy, and was elected member of the states-general by the people of Paris.

In this position, he appeared as the resolute foe of the ancient régime. He gained possession of, and published, the so-called *Red Book*, giving accounts of court expenditure, which was highly disadvantageous to the court and its ministers. After the flight of Louis XVI., C., with Montmorin, Lafayette, and Bailly, accused the king of treason and conspiracy, and insisted on the suppression of all orders and corporations based on hereditary rights. As conservator of the national archives, he rendered an important service by preserving from destruction the old documents of the abolished corporations and institutions. He was absent in Belgium during the king's trial, but sent his vote for death. In Mar., 1793, when he was commissioned to make prisoners of Dumouriez and other generals suspected of treason, C. himself and his four colleagues were taken prisoners and delivered over to the Austrians (April 3); but, after an imprisonment of two and a half years, he was exchanged for the daughter of Louis XVI. On his return to Paris, he was made member of the council of five hundred, of which he became president, Jan. 23, 1796, but resigned 20th May, 1797, and devoted his time to literature. Remaining, however, true to his principles, he voted, July 10, 1802, against Napoleon's proposed consulship during life. C. died of apoplexy, Nov. 2, 1804.

CAMUS, CHARLES ETIENNE LOUIS, 1699-1768; a French mathematician, associate of the Paris Academy of Sciences, and member of the Royal Society of London. In 1736, he accompanied Maupertuis and Clairaut in an expedition to Lapland to measure a degree of the meridian. He was the author of a *Course of Mathematics*, and several essays on mechanical and mathematical subjects.

CAMWOOD, or **BARWOOD**, a dyewood which yields a brilliant but not permanent red color, and is used along with sulphate of iron to produce the red color in English bandana handkerchiefs. It is the wood of *baphia nitida*, a tree of the natural order *leguminosæ*, sub-order *cæsalpinieæ*, a native of Angola. It is preferred to Brazil wood (q.v.), as producing a finer and richer red.

CA'NAAN, the fourth son of Ham, and grandson of Noah. The posterity of Canaan were numerous, there being ten sons who were the fathers of as many tribes dwelling in Palestine and Syria. His eldest son, Zidon, is supposed to have been the founder of the city of Sidon. The whole of Palestine was called after the patriarch the "Land of Canaan." As to the curse pronounced by Noah upon Canaan and his descendants, there is no just reason to suppose that it was the immediate consequence of the unfilial conduct of Ham.

CA'NAAN. See **PALESTINE**.

CA'NAANITES, a collective name for the several nations conquered by the Israelites on the w. side of Jordan. Five, six, seven, and ten nations are mentioned in various places in the Old Testament; but of only two of them have we any collateral information—the Hittites, and the Amorites. And the former of these appears to have been included not with strict propriety among the Canaanites, evidence now tending to show that they not only dwelt beyond the border of Canaan, but did not even speak a Semitic language; nor were they homogeneous with other Canaanitish people. In general, the Canaanites are described as living in a state of political disintegration; the combined result of Semitic love of independence, and of varied conformation of the soil. Thirty-one of their petty kings are mentioned in the book of Joshua. That the Israelites were not immediately successful in conquering the C. is now universally recognized. The work of many years was concentrated by tradition on a single great name. The immediate result of the Israelite invasion was, not the extinction of the old, but the addition of a new element of stronger material, but less advanced culture. The chief object of Canaanitish worship was the dual-natured god of life and fruitfulness, Baal, or the Baal, "the lord," and his consort Ashérah, "the happy." The masculine form of the latter was the name of one of the twelve sons of Jacob. Ashérah must not be confounded with Ashtoreth or Astarte, who belonged to another type of Semitic religion. The symbol of Ashérah was the stem of a tree, though possibly sometimes carved into an image; that of the Baal probably had the form of a cone and represented the rays of the sun, or the generative power. It is these symbols which are referred to in the phrase "the Baals and Ashérah's" (Judges iii. 7), where "the groves" of the king James's version is clearly a mistranslation. The licensed harlotry which formed a part of the worship of Ashérah was peculiarly obnoxious to the later Hebrew prophets, though, indeed, even the folk-lore of the Israelites shows traces of aversion to its attendant immorality. Another characteristic of the Canaanitish religion was soothsaying, and this was vigorously denounced by the conquerors (Deut. xviii. 10-14). There were relics of Canaanitish times in old traditions which the Israelites did not suppress, and it is alleged by uncompromising historical critics that some of the narratives in Genesis are revised and purified versions of Canaanitish legends. The most obvious of these are said to be the stories which are attached to localities in Canaan, such as Luz and Beersheba. The question whether a remnant of the old population of Palestine may not be still in existence is answered in the affirmative by several recent investigators, who find descendants of the C. in the fellahs or peasants of the Holy Land. From an ethnological point of view there seems to have been a close affinity of the three peoples, the Israelites, the C., and the Phœnicians, who appear to have

migrated successively from a Babylonian centre, and the last to move westward were probably the Hebrews.

CANADA, DOMINION OF, occupies the northern part of North America between the meridians of 52° and 141° w. long., while its most southern point is 41° 45' n. lat. It is bounded on the north by the Arctic ocean; on the east by the Atlantic ocean, eastern Labrador and Newfoundland; on the south by the United States; and on the west by the Pacific ocean and Alaska. It is about 3500 miles in length from east to west, and has an area greater than the United States, including Alaska, and nearly as large as that of the continent of Europe, its land surface being 3,315,647 sq. m.; its gross area, 3,456,383 sq. m. The land surface is distributed as follows: Prince Edward Island, 2000 sq. m.; Nova Scotia, 20,550; New Brunswick, 28,100; Quebec, 227,500; Ontario, 219,650; Manitoba, 64,066; Assiniboia, 88,534; Saskatchewan, 101,092; Alberta, 105,355; Athabasca, 103,300; British Columbia, 382,300; North-west Territories and Arctic Islands, 1,811,555. The crown colony of Newfoundland, with its dependency, eastern Labrador (162,200 sq. m.), are not, of course, included. The name Canada is supposed to be derived from the Indian *kannatha*, a collection of huts, and to have been misapplied by Cartier to the whole country.

History. The "mound-builders" of prehistoric times, whose earthworks and sepulchral mounds are found in Manitoba and elsewhere, would appear to have been the early inhabitants of this vast country, and succeeding them, if not their actual descendants, were the Iroquois, Hurons, and other tribes. If we refuse the title of discoverer to Bjarne Hierulfsen (see ERIC THE RED), who coasted along the shores of Labrador about 986, we must bestow it upon the Cabots, who visited Labrador in 1497 and, supposing it to be India, named its inhabitants "Indians." The first, however, to penetrate the interior was Jacques Cartier, a French navigator who, in 1534, entered the St. Lawrence on the festival of the saint of that title and took nominal possession of North America in the name of his king, Francis I. Returning in 1535, he ascended the St. Lawrence to Hochelaga (Montreal), and after passing the winter at Stadaconé (Quebec), went back to France. In 1603, 1604-1607, and 1608, Samuel de Champlain visited and explored parts of Canada, discovering the lake now bearing his name, and lakes Ontario and Nipissing, and founding Quebec, 1608. From this time on France claimed and ruled for 150 years the region from Acadie to lake Superior, and down the Mississippi to New Orleans. In 1670 the Hudson bay company (q.v.) obtained from Charles II. the exclusive right to trade in the territory watered by the tributaries of Hudson bay. The missions, forts, and settlements of the French were rapidly established over her domain, but the struggle with England began early, and in 1629 Quebec was captured, to be restored in 1632. In 1713 France restored to England Hudson bay, ceded Newfoundland, Acadie (Nova Scotia), and the Iroquois country, retaining only the valleys of the St. Lawrence and Mississippi. In 1759-60 Quebec, Montreal, and other strongholds were captured by the English, and the era of French dominion ceased. The French inhabitants of Canada were secured in the free exercise of their religion, peace was concluded between England and France in 1763, and a small part of the newly acquired country was organized by royal proclamation under English laws. In 1774 the new province was extended by parliamentary enactment (and under French laws) down the Ohio to its confluence with the Mississippi, and up the latter stream to its source. During the American revolution attempts were made to induce the British colonies of Canada and Nova Scotia to rebel, and in 1775 occurred the disastrous expedition against Montreal and Quebec of Montgomery and Arnold. In 1783 Canada was reduced in area by the cession to the United States of a territory now constituting the states of Minnesota, Wisconsin, Michigan, Ohio, Indiana, and Illinois; in 1791 it was divided under separate legislatures into two sections—the eastern retaining French institutions, and the western receiving those of England; and these sections, again, after political discontent had in each ripened into armed insurrection (1837-38), were re-united for legislative purposes in 1840, a union which was not successful. In 1867 Upper and Lower Canada, Nova Scotia, and New Brunswick were united as the Dominion of Canada; the Hudson bay company's territory was acquired in 1869, and in 1870 was divided into Manitoba and the North-west Territories, both being admitted into the confederation that year. Part of the North-west Territories was subsequently divided into districts as follows: In 1876, Keewatin; in 1882, Assiniboia, Saskatchewan, Alberta, and Athabasca. In 1871 British Columbia, and in 1873 Prince Edward Island, entered the union, Newfoundland standing aloof, as it does to-day. Other events were the Red river rebellion, in 1869; the treaty of Washington, in 1871, dealing with the fisheries and mutual use of canals, etc., and the award of the fisheries commission in 1877 (see FISHERIES); the adoption in 1879 of a higher customs tariff; the outbreak of the half-breeds under Louis Riel (q.v.) in 1885, and the completion of the Canadian Pacific railroad in that year; the unsuccessful attempt of Manitoba, in 1887, to construct the Red River Valley railroad; the signing of the treaty for the settlement of the fisheries disputes between Great Britain and the United States in 1888; and the agitation in Newfoundland, 1887-91, over encroachments by French fishermen, and the claimed lack of protection afforded the colony by the British government.

Topography. The most prominent physical features of the Dominion are the Rocky

mountain system and the ranges west of it, the Laurentian range, the great inland plain, and the inland lakes. The Rocky mountains extend in a northwesterly direction the whole length of the Dominion, and consist in many sections of triple chains with beautiful valleys between, the most easterly of these chains having the highest elevations. Of these, the chief are, Mt. Hooker, 16,760 ft.; Mt. Brown, 16,000 ft.; and Mt. Murchison, 15,700 ft. Just south of the latter peak the Central Pacific R.R. crosses the range through the Kicking Horse Pass at an altitude of 5300 ft. above the sea. In the east, the Laurentian range, forming the water-shed between the St. Lawrence and the Hudson bay river systems, has a length of 3000 miles and an average height of 2500 feet. South of the St. Lawrence are the Nôtre Dame, or Shickshock mountains, in Quebec, and hills of no great height in Nova Scotia and Cape Breton. In the eastern provinces the surface, as a whole, consists of hilly sections, sometimes heavily wooded, interspersed with extensive tracts of undulating and fertile land. The central portion of the Dominion consists of a vast undulating plain extending westward to the base of the Rocky mountains. The northern part of this great plain consists of three distinct prairie plateaux. The most eastern (in Manitoba) is familiarly known as the Red River Valley and Lake Winnipeg region. It has an average altitude of 800 ft., and is estimated to contain 7000 sq.m. of the finest wheat-land in the world. The second, with an average altitude of 1600 ft., and an area of about 105,000 sq.m., includes the Assiniboine and Qu'Appelle river valleys, and is unusually fertile. The third plateau, beginning with an altitude of about 2000 ft., extends westward for 455 miles to the foot of the Rocky mountains, where it attains an altitude of about 4200 ft. This section includes the western half of Assiniboia and the whole of Alberta, and is admirably adapted for grazing purposes. The northern part of this great central plain is a vast tract of forest and prairie, which has great agricultural and mineral resources. West of the Rocky mountains is a mountainous or hilly region consisting principally of short ranges, and detached groups of mountains interspersed with plateaux and valleys, and extending to the Pacific. The Cascade, the principal range, rises in some places to an elevation of 10,000 ft., and follows the general outline of the coast its entire length, also forming a part of the boundary between Canada and Alaska. In the plateaux west of the Cascades are the sage brush plains, which can never be cultivated to any extent for lack of irrigation.

The Selkirk range of the Rocky mountains has a glacier region of greater extent than that of Switzerland, and the Cascade range contains many extinct volcanoes. The coasts of Canada are broken by many deep indentations, forming magnificent harbors and sheltering bays. On the Atlantic coast are Hudson bay, really an inland sea, with an area of over 500,000 sq.m., a uniform depth of seventy fathoms, and never frozen except along the shores; the Gulf of St. Lawrence, 80,000 sq.m. in extent; the Bay of Fundy, remarkable for its tides, and the Bay of Chaleurs. On the Pacific side is Georgian bay, one of the most picturesque and remarkable bodies of water on the globe. The northern shores are bordered by a labyrinth of islands, some, like Baffin Land, being of immense size, while off the eastern coast are Prince Edward Island, Cape Breton, a part of Nova Scotia, and Anticosti, noted for its signal and wrecking stations. The principal islands on the western coast are Vancouver and Queen Charlotte. The great inland lakes on the southern border form a perfect system of navigation from near the heart of the continent to the Atlantic ocean, a distance of 2384 miles. Other important lakes in the Northwest Territories are: Great Slave, 12,000 sq.m.; Great Bear, 10,000 sq.m.; Athabasca, or "swampy," 3000 sq.m.; in Manitoba and Saskatchewan, Winnipeg, or "Great Sea," 8500 sq.m., Winnipegosis, or "Little Sea," 1936 sq.m., and Manitoba, or "Strait of the Gods," 1900 sq.m. In Ontario, Lake of the Woods is of historical interest, as being the starting point for the international boundary in every treaty between the United States and Great Britain. The principal rivers are the Mackenzie, nearly 2500 miles in length, the Copper Mine, and Great Fish, flowing into the Arctic ocean; the Saskatchewan, or swift current, Assiniboine, and Red, emptying into lake Winnipeg; the Churchill, Severn, and Albany, into Hudson bay; the Fraser, flowing into the Pacific, the Columbia, which after a course of 1200 miles enters the United States, and the Peace, tributary to the Mackenzie. In the eastern provinces are the majestic St. Lawrence, draining an area of 330,000 sq.m., with its tributaries, the Ottawa, Richelieu, St. Maurice, and Saguenay; and the St. John, Restigouche, and Miramichi in New Brunswick. The mountain, river and lake scenery of Canada is remarkably varied in character and grand in its proportions.

The most important minerals found are coal, iron, gold, silver, copper, and galena, which are widely distributed, besides asbestos, pyrites, phosphates, manganese, cobalt, building-stones, and marbles of great variety. There are large coal deposits in Nova Scotia, and the coal region of British Columbia and the Northwest Territories is of enormous extent. Petroleum and salt are obtained in several localities.

Flora. This includes about sixty species of trees, some of them peculiar to Arctic regions, while others are found generally throughout the northern United States, and that same statement applies to the plants. On the Pacific coast and its islands the common trees are the oak, yew, arbutus, dogwood, willow, aspen, poplar, alder, crab apple, and vine-maple, while the mountains of British Columbia and the Northwest Territories are covered with dense forests of coniferous trees, among them the gigantic Douglas pine, the white, yellow, and balsam pine, the cypress, larch, Scotch fir, and Alaska cedar. The prairies are either treeless or have groves of second-growth

aspens, spruces, and birches. The valley of the St. Lawrence still contains some large forests of coniferous and deciduous trees, such as the white, red, and gray pine, red cedar, tamarack, ash, elm, beech, birch, the red, black, white, yellow, bird's-eye and sugar maple, hickory, butternut, black-walnut, chestnut, ironwood and hazel. The wild vine is abundant everywhere, and among small fruits are the plum, crab apple, red and choke cherry, strawberry, blackberry, raspberry, mountain and bog cranberry, gooseberry, red and black currant, and the blueberry, which is such an important article of commerce along the St. Lawrence and Saguenay. The flowers found on the prairies and mountains are numerous and beautiful, the ferns embrace many rare species, and the mosses, lichens, and fungi are very brilliant in color.

Zoology. Selecting a few names from the long list of animals, birds and wild fowl, and fishes, we mention the polar, black, brown, and grizzly bear, wolf, lynx, wildcat, fox, elk, caribou, moose, antelope, deer, wood-buffalo, mountain goat, big-horn, reindeer, musk-ox, beaver, porcupine, sea-otter, fur seal, and walrus; the swan, snowy-owl, pelican, bald-eagle, whooping-crane, horned lark, cross-bill, snow-bunting and humming-bird; the white whale, sperm-whale, narwhal, salmon, sturgeon, cod, mackerel, lake trout, brook trout, muskallonge, herring and pike. Lobsters and other shell-fish abound.

Climate. This is varied, but, on the whole, dry and invigorating, and the winters are rendered exhilarating by the lack of humidity. The numerous lakes of upper Canada help to neutralize the extremes in that section, Toronto seldom having more than six weeks of sleighing, while Quebec usually enjoys it for five or six months. The average winter for a large area of the country is about four and a half months, and for the settled portions the average summer includes June and September. British Columbia and the adjoining provinces have a delightful climate throughout the year, owing largely to the influence of the Kuro-Shiwo (q.v.), or gulf stream, of the Pacific. In 1884 the extremes of temperature at Toronto were 89.6° and -13.3°; at Montreal, 91.0° and -23.5°; of Halifax, 88.0° and -11.1°; at Winnipeg, 88.5° and -44.5°; at Victoria, 86.0° and 8.0°. The average annual rainfall at St. John, Newfoundland, is 58.30 inches, and at Toronto, 35.17.

Agriculture.—In 1891, 28,537,242 acres were returned as being improved land, and of this 19,904,826 acres were reported as under crop. The number of tilled acres is being rapidly increased. The eastern provinces are noted for their wheat, oats, barley, and buckwheat, and for their horses and cattle. Ontario's dairy farms and apple orchards are famed, and the Annapolis valley, in Nova Scotia, is one of the best apple-growing countries on the continent. The Isle of Orleans, below Quebec, produces very fine plums; Toronto and the country westward, choice melons, grapes, and peaches; and Manitoba and British Columbia supply the harder fruits in profusion. The central provinces raise on their prairie lands immense crops of wheat, oats, and barley, and large numbers of horses and cattle. Manitoba vies with the Dakotas in the production of wheat, and Alberta and the North-west Territories have peculiar advantages as grazing regions, as well as for cereal crops. British Columbia, though not possessed of such large tracts of arable land as the other provinces, can still boast of its greater adaptability for fruit-raising. There are experimental farms in several places, the most important being those near Ottawa, and Brandon, Manitoba. There are no complete agricultural returns for the whole of Canada, but in 1891 there was a total yield of 42,144,779 bushels of wheat, 82,515,413 bushels of oats, and 52,653,704 bushels of potatoes. There were 1,470,572 horses, 4,120,586 cattle, and 1,733,850 swine.

Manufactures and other Industries.—There has been a rapid advance in manufacturing since 1878. In 1891 the capital invested was \$354,620,750; the wages paid were \$100,663,650; the hands employed, 370,256; the value of articles produced, \$476,198,886. Articles of wood, iron, and leather are chiefly manufactured. The total value of forest products in 1891 was \$80,071,415, the total cut of standing timber being 2,045,073,072 cubic feet; about 30 per cent. of the total was exported, leaving 1,431,551,150 cubic feet for home consumption. The mineral products in 1895 were valued at \$22,500,000, including coal, \$7,774,178; gold, \$1,910,921; nickel, \$1,360,984; and petroleum, \$1,201,184. The fisheries of the eastern and Pacific coasts are among the richest and most important in the world, while the fresh-water fisheries of the great lakes and rivers are also very fine. In 1894, the total number of men employed was 70,719, using vessels, boats, nets, etc., valued at \$9,439,116; value of the yield, nearly \$21,000,000. Of this amount, the value of the cod fisheries was \$4,225,896; the salmon, \$3,218,551; and the lobster, \$2,370,632. The catch of the seal-fisheries was 95,048 seals, value of fur seal skins, \$948,490. There are twelve Government fish hatcheries in operation. A treaty for the settlement of the fishery disputes between Canada and the United States was signed by the representatives of the governments in Feb., 1888, and was to be ratified in two years. In the mean time a *modus vivendi* was offered, providing that United States vessels might have all the privileges mentioned in the treaty on payment of a license fee of 150 dollars a ton.

The main points in the treaty were as follows: Canada had the right to fisheries within a three-mile limit of the general coast line, except in the case of bays ten miles wide or less, when the line was to be from headland to headland; also, certain bays were exempted entirely from the operation of the treaty. Fishing vessels belonging to the United States might land, sell or transship cargoes only in cases of distress, might enter ports for wood,

water, shelter, or repairs, and after obtaining a license (given without charge), for casual supplies or stores, excepting bait. Certain concessions were made in the matter of reporting at custom ports, and of dues for pilotage, harborage, etc. At any time when the United States should see fit to admit Canadian fish and fish products free of duty, then all restrictions as to landing cargo, purchasing bait, etc., were to be withdrawn until duty was again required. Pending the ratification of the treaty, the *modus vivendi* clause was deemed to be in force since 1889.

Trade and Commerce. The total value of the exports in 1895 was \$113,638,803; of imports, \$110,781,682; of imports for home consumption, \$105,252,511. The value of exports to Great Britain was \$61,856,990, to the United States, \$41,297,676, imports for consumption from Great Britain, \$31,138,414, from the United States, \$59,337,239. The excess of imports from the United States was due to purchases not supplied by Great Britain. The leading imports were wool and manufactures of wool, iron, steel, and manufactures of these metals, coal, and coke, and breadstuffs, the leading exports, lumber, and other forest products, animals and animal products, grain and other agricultural products. The trade in coin and bullion in 1895 was, imports, \$4,576,620; exports, \$4,325,319. The duty collected on imports aggregated \$17,887,269. The shipping of the Dominion in 1895 comprised 7,262 vessels of 825,837 aggregate tonnage. The number of seagoing vessels that entered and cleared Canadian ports was 27,876, of 10,976,829 tons, including 12,918, of 2,054,024 tons, Canadian.

Banks and Postoffices. Every bank, in making payments, is compelled to have a certain proportion of government notes, and must hold half, and not less than 40 per cent. in government notes. In 1895 there were 38 incorporated banks making returns to the government, with numerous branches. The capital paid up was \$61,800,700; the notes in circulation, \$30,807,041; total on deposit \$190,916,939, liabilities, \$229,794,322; assets, \$316,536,510. Postoffice savings-banks have been in operation since 1867; there are also government savings-banks in the maritime provinces, Manitoba, and British Columbia. In 1895 there were 731 offices of the former and 35 of the latter. The depositors in 1895 numbered 175,560, and the deposits amounted to \$44,450,498 in both kinds of banks.

Canals, Railroads, Postoffices, etc. The St. Lawrence system of navigation extends from the straits of Belle Isle to Duluth, 2384 miles, and for 71½ miles there are canals to overcome the rapids and the difference in level between Lake Superior and tide-water (600 feet). The most important of these canals is the Welland, 26¼ miles in length, making a detour of Niagara Falls. It is 14 feet in depth, with 26 locks, and a total rise of 326¼ ft. There are also other important systems in the eastern provinces, of which the Rideau is one of the oldest. There were in Canada, in 1895, 16,091 miles of railroad in operation. The principal systems are the Canadian Pacific (6,174 miles), and the Grand Trunk System (3161 miles). The first railroad in Canada was opened in 1836; the Canadian Pacific railroad was completed in 1885. In 1887 Manitoba passed a local act for the construction of a railroad through the Red river valley to connect with the railroad systems of the United States, but this was disallowed by the governor-general as conflicting with the monopoly clauses of the Canadian Pacific Railway act. An injunction being obtained, work ceased for a time, but the railroad was finally completed. The total paid-up capital of all railways, 1895, was \$894,640,559; of passengers carried, 13,987,580; freight tonnage, 21,524,421; earnings, \$46,785,487; and expenses, \$32,749,669. A railroad from Winnipeg to Port Nelson on Hudson bay is in progress, and is to connect with a steamship line to England. Port Nelson is 2966 miles from Liverpool, thus being nearer than either Montreal or New York. The Imperial and Dominion governments have decided to subsidize a line of steamers from Vancouver to Hong Kong and Japan, and establish a regular mail service over this route to the East, conducted by the Canadian Pacific Railway company. On June 30, 1895, there were 8,832 postoffices in the Dominion, and the number of letters sent during 1894-5, was 107,565,000. The revenue was \$3,815,456, and the expenditure, \$3,593,647. There were 28,815 miles (3,176 being government) of telegraph lines in 1895, and 68,244 miles of wire with 2,556 offices; also 44,000 miles of telephone wire, with 33,500 instruments.

Religion. There is no state church, but the Roman Catholic church in Quebec is guaranteed the privileges enjoyed previous to British possession. The Roman Catholic church in Canada has (census of 1891) 1 cardinal, 7 archbishops, 23 bishops, 1500 clergy, and 1,992,017 communicants (chiefly in Quebec). The Church of England has 2 metropolitans, 18 bishops, about 1000 clergy and 646,059 communicants. The Presbyterian Church in Canada, formed by the union, in 1875, of two distinct bodies, has 755,326 communicants; the Methodists, 847,765 communicants; the Baptists, 303,839 communicants; the Lutherans, 63,982 communicants; the Congregationalists, 28,157 communicants. Members of miscellaneous denominations number 123,111. The leading denominations have each one or more divinity schools.

Education. This is controlled by the governments of the several provinces, except in British Columbia and the Northwest Territories, where the schools are supported wholly by the general government. Education is more or less compulsory, except in New Brunswick. In Ontario, Quebec, and the Northwest Territories there are separate schools for Roman Catholics. In 1895, the public schools numbered 20,081. The total number of pupils was 923,660, and the expenditure for the support of these schools, including government grants, was \$8,323,097. There are also 112 universities and classical colleges, including Dalhousie, N. S. (founded 1820); McGill, Quebec (1821);

New Brunswick (1828); Toronto, Ont. (1828); Queen's, Ont. (1841); Laval, Quebec (1852); Manitoba (1877); and the Royal Military college, Kingston, Ont. (1874). The principal scientific societies are the Royal Society of Canada; Natural History Society of Montreal; Canadian Institute, Toronto; Nova Scotia Institute; Natural History Institute, New Brunswick; and Scientific and Historical Society, Winnipeg.

Government. Until 1849, Montreal was the capital; then the legislature met at Toronto and Quebec alternately until 1857, when Ottawa became the permanent seat of government. The executive authority is vested in the sovereign of Great Britain and Ireland, and is carried on in her name by a Governor-General, receiving a salary of \$50,000 per annum, and a Privy Council of fifteen heads of departments, which is responsible to the parliament. The legislature consists of two houses—a Senate of 81 members, nominated for life by the governor in council, and a House of Commons of 215 members elected every five years, unless sooner dissolved by the people. The number of representatives is in proportion to population and is readjusted after every census. In 1895 there were 24 senators and 92 representatives from Ontario; 24 senators and 65 representatives from Quebec; 10 senators and 20 representatives from Nova Scotia; 10 senators and 14 representatives from New Brunswick; 4 senators and 7 representatives from Manitoba; 4 senators and 5 representatives from Prince Edward Island; 3 senators and 6 representatives from British Columbia; and 2 senators and 4 representatives from the Northwest Territories. At the head of each province is a lieutenant-governor, appointed by the governor in council and paid by the Dominion, but responsible to the local legislature. In most of the provinces there are two houses of legislature. The territories are administered by a lieutenant-governor and a council, partly elected and partly nominated. The limits of federal and provincial jurisdiction are regulated by the British North America act of 1867, which is the constitution of the Dominion. The revenue for the year ending June 30, 1895, was \$33,978,129, of which \$25,446,199 was derived from customs and excise; the expenditure was \$38,132,005. The public debt was \$318,048,755; assets, \$64,973,828; net debt, \$253,074,927. The public debt has increased steadily since confederation, but the government has expended nearly \$200,000,000 on public improvements since that act. The Supreme Court, constituted in 1875, meets three times a year, and has appellate, civil, and criminal jurisdiction throughout Canada. Each province has its Superior Court, the maritime provinces have vice-admiralty courts, and there are county courts with limited jurisdiction in all the provinces.

Army. The eastern provinces and western Canada have neither natural barriers nor fortifications. Halifax and St. John, New Brunswick, are the only fortified places in Canada, properly speaking, but the erection of fortifications on the Pacific coast is contemplated. In 1871 the strength of the troops maintained by the Imperial Government was reduced to 2000 men, forming the garrison of the fortress of Halifax. There is a large volunteer militia force divided into an active force (volunteer and marine militia) and a reserve force. All male subjects between 18 and 60 may be called out to serve. In 1895 the active militia consisted of 36,041 officers and men, and the permanent militia, of 1227 officers and men. The number of men available for active service is about 1,000,000. The Dominion is divided into 11 military districts. There is a royal military college at Kingston. Quebec has a government cartridge factory, Halifax is the only imperial military station, and Esquimalt, British Columbia, the only naval station.

Population. In 1762 the French population amounted to about 65,000, confined to the immediate banks of the lower St. Lawrence and its tributaries; in 1791 Upper Canada had 50,000 inhabitants and Lower Canada 130,000. In 1860, the total population, exclusive of Indians, in the Northwest and Hudson bay territories, was 3,906,810—2,110,502 born in Great Britain and Ireland and 1,082,940 French; in 1871, 3,635,024; in 1881, 4,324,810; in 1891, 4,833,239; distributed as follows: Ontario, 2,114,321; Quebec, 1,488,535; Nova Scotia, 450,396; New Brunswick, 321,263; Manitoba, 152,506; British Columbia, 98,173; Prince Edward Island, 109,078; and the Territories, 98,967. The most populous cities and towns, 1891, were Montreal, 216,650; Toronto, 181,220; Quebec, 63,090; Hamilton, 48,980; Ottawa, 44,154; St. John, 39,179; Halifax, 38,556; London; 31,977; Winnipeg, 25,642; and Kingston, 19,264. Of the total population, 1891, 2,460,471 were males, and 2,372,768 females; 4,185,877 were born in Canada, and 647,362 elsewhere; and 1,992,017 belonged to the Roman Catholic church, 847,765 to the Methodist, 755,326 to the Presbyterian, 646,059 to the church of England, and 303,839 to the Baptist; the Indian population was estimated at 106,205 in 1892 and 102,275 in 1895, the largest number being in British Columbia and in Manitoba and the Territories. Of the total foreign-born population, 1891, 490,252 were born in various British possessions, and 157,110 in foreign countries, including 80,915 from the United States.

See Morgan, *Bibliotheca Canadensis* (Ottawa, 1867); Faillon, *Histoire du Canada* (Mont., 1865); the histories by Kingsford (8 vols., 1888), Bryce (1887), and Greswell (1890); Stewart, *Canada under Lord Dufferin* (1878); Collins, *Canada under Lord Lorne* (1884); Adam, *The Canadian Northwest* (1885); Aitken, *The Dominion of Canada; a Study of Annexation* (1890); Grant, *Picturesque Canada* (1884); Lovell, *Gazetteer and History of Canada* (1887-89); Marquis of Lorne, *Canadian Life and Scenery* (1885); Petitot, *Traditions Indiennes du Canada Nord-ouest* (1886); *Her Majesty's Colonies* (Colonial Exhibition Handbook, 1886).

CANADA BALSAM is a kind of turpentine (q.v.) obtained from the balm of Gilead fir (*abies* or *picea balsamea*), a native of Canada and the northern parts of the United States. See **FIR**. It exists in the tree in vesicles between the bark and the wood, and is obtained by making incisions, and attaching bottles for it to flow into. It is a transparent liquid, almost colorless, and with an agreeable odor and acrid taste. It pours readily out of a vessel or bottle, and shortly dries up, and becomes solid. When fresh, it is of the consistence of thin honey, but becomes viscid, and at last solid by age. It consists mainly of a resin dissolved in an essential oil, and its composition is approximately : essential oil, 24 parts ; resin, soluble in boiling alcohol, 60 ; resin, soluble only in ether, 16.

It is the finest kind of turpentine obtained from any of the *coniferae*, and was formerly employed for medicinal purposes, particularly as a stimulant for the cure of mucous discharges, and as a detergent application to ulcers. It is also used for a variety of purposes in the arts—as an ingredient in varnishes, in mounting objects for the microscope, in photography (q.v.), and by opticians as a cement, particularly for connecting the parts of achromatic lenses to the exclusion of moisture and dust. Its value for optical purposes is very great, and depends not only on its perfect transparency, but on its possessing a refractive power nearly equal to that of glass.

CANADA CLERGY RESERVES. See **POLITICAL PARTIES, CANADIAN**.

CANADA GOOSE. See **GOOSE**.

CANADIAN POLITICAL PARTIES. See **POLITICAL PARTIES, CANADIAN**.

CANADIAN RIVER, rising in n.e. New Mexico, 25 m. n.e. of Santa Fé, running s. 150 m., and then e. near the bounds of the Indian territory and Texas, thence through the Indian territory, and emptying into the Arkansas river near the w. boundary of the state of Arkansas ; whole length about 600 miles.

CANAILLE (Fr. from Latin *canis*, a dog, and originally meaning "a pack of dogs"), a contemptuous name given to the populace, signifying the lowest class of the people, the rabble.

CANAJOH'ARIE, a t. and village of Montgomery co., N. Y., 55 m. n.w. of Albany ; pop. of village, 1890, 2089. There are fine stone quarries in the vicinity, and the town contains several factories.

CANAL, an artificial channel for water, formed for purposes of drainage, irrigation, or navigation, but now usually employed to designate only such cuts as are intended for the passage of vessels.

Canals date from a period long anterior to the Christian era, and were employed as a means of irrigation and communication by Assyrians, Egyptians, and Hindus ; also by the Chinese, whose works of this kind are said to be unrivaled in extent ; one of them, the Imperial C., having a length of about 1000 miles. For the most part, however, these early canals were of one uniform level, and hence exhibit no great skill or ingenuity ; and the moderns were content to follow the rudimentary efforts of the ancients in this way until the 15th c., when the invention of the lock (q.v.)—showing how canals might be generally and advantageously used for inland navigation in countries whose surface was irregular—gave a great impulse to this branch of engineering. The Italians and Dutch, for both of which nations the invention of the lock has been claimed, were the first to develop this kind of engineering in Europe. In France, the first C., that of De Briare, to form a communication between the Loire and the Seine, was opened in 1642. In 1681 was completed the greatest undertaking of the kind on the continent, the C. of Languedoc, or the C. du Midi, to connect the Atlantic with the Mediterranean. The length of this C. is 148 m., it has more than 100 locks, and about 50 aqueducts, and in its highest part it is no less than 600 ft. above the sea. It is navigable for vessels of upwards of 100 tons. It was not until nearly a century later that C. navigation assumed importance in England, through the sagacity, energy, and liberality of the duke of Bridgewater (q.v.), and his celebrated engineer, James Brindley (q.v.). The success of these works stimulated other public persons to engage in similar undertakings. Speculation in C. shares became a mania similar to that which overtook the people in connection with railways at a more recent period, and a crash ensued on the prospect of war in 1792. In the space at our disposal, we shall briefly consider the several kinds of canal. See **SUEZ** and **SUEZ CANAL : INTEROCEANIC SHIP CANAL**.

Canals may be divided into three general heads—viz., 1. Canals proper, i.e., entirely artificial channels, having no water running through them beyond what is necessary for their own purpose ; 2. Tidal, i.e., affected by the rise and fall of the tides ; and 3. Rivers rendered navigable by weirs built across them to increase their depth, and having a lock at one end for the ascent or descent of vessels ; and occasionally, when there is much fall, or any formidable obstruction in the river, by lateral cuts, with locks for part of their course.

Another division may be made (1) of ship-canals for the transit of sea-going vessels generally, from sea to sea ; these are necessarily of large dimensions, and must be crossed by swing or draw bridges ; and (2) of canals for the passage of mere boats or barges, generally without masts, so that they may be crossed by stone or other solid bridges. The

largest ship C. in Europe is the Great North Holland C., completed in 1825, which has a breadth of 125 ft. at the water-surface, and of 81 ft. at the bottom, with a depth of 20 feet. It extends from Amsterdam to the Helder, a distance of 51 m.; it thus enables ships of as much as 1400 tons burden to avoid the shoals of the Zuyder Zee. The surface of the water in this C. is below the high-water level of the German ocean, from which it is protected by embankments faced with wicker-work. The locks on this C. are 297 ft. long, 51 ft. broad, and 20 ft. deep. There is a similar C. from near Rotterdam to Helvoetsluis, to avoid the shallows of the Brill at the mouth of the Maas. Another great ship C. is the Caledonian C. (q.v.). The Forth and Clyde C. is also one on a smaller scale for the passage of sea-going vessels. Its length is 35 m.; its medium width is 56 ft. at the surface, and 27 ft. at the bottom, and its depth 9 feet. It has 39 locks, each 75 ft. long, and 20 ft. wide, and a rise of 155 feet. In constructing ship-canals, it is important to secure a sheltered entrance, one not likely to become silted up, and of sufficient depth to admit vessels at all times of the tide; and towing-paths on both sides are desirable.

The C. of the Loire is one of those aiding the navigation of a river. It has a width on the water line of 33 ft., and a depth of $5\frac{1}{2}$ ft., the locks being 17 ft. broad, and 100 ft. long. The river Lea and the Mersey and Irwell Navigations in England, and the Welland C. in Canada, formed to connect lake Erie with lake Ontario, and avoid the falls of Niagara, are also among the most noteworthy works of this class; the river Thames, above the first lock at Twickenham, partakes also of the nature of a canal.

Many canals pass through long tunnels, some very low and without towing-paths, in which case the mode of propulsion is by the boatmen lying on their backs and pushing with their feet against the roof of the tunnel.

The great expenditure of water and time in "locking" have led to the trial of various other plans for overcoming differences in level. On the Great Western C., boats are raised and lowered by means of machinery, called a perpendicular lift. On the Morris C. (United States), boats are conveyed on a carriage up a railway inclined plane, from one reach to another.

Other matters engineers have to consider are an ample supply of water, by means of feeders and reservoirs to the summit-level; stop-gates at convenient distances, to shut off the water in case of damage to any part of the C.; means of drainage when repairs are necessary; and provision against leakage through the banks, by puddling or otherwise. The floor-line or bottom of a C. is usually made twice the width of the largest boat likely to enter the C., with an addition of 6 or 8 in. for play at each side, and the depth 12 or 18 in. more than the draught of the boat.

The introduction of railways has materially interfered with C. traffic, and some canals have been altogether abandoned. Many, however, still continue to prosper, as, for instance, the Grand Junction, the Lea Navigation, and the Trent and Mersey. It is estimated that the inland boat navigation constructed in Great Britain exceeds 4,700 miles. In the United States there are upwards of 4,000 m. of C., of which 1300 m. are in New York state. The C. system has also been very extensively carried out in France, which has a large mileage of artificial inland water navigation. A new canal, which shortens the distance from Amsterdam to the North sea to 15 m., has recently been completed. The harbor is near Wyk-aan-Zee, and the minimum width is to be 80 yards. This canal was constructed mainly by British capital and engineers.

There are traces near Corinth, Greece, of a canal projected by Alexander the Great, determined upon by Julius Cæsar, and actually begun by Nero, though the work never progressed beyond a few hundred yards. This canal was to shorten the distance between the Mediterranean and the Black Sea, and work was commenced on it again in 1882. It is four miles long, a portion of the distance being through rock; it is $26\frac{1}{2}$ ft. deep, with bottom width of 72 ft.; no locks; and with solid jetties built out into the sea at either end as protection to the entrances. Its estimated cost is about \$5,000,000. The Manchester ship-canal, connecting that city with the sea, was begun in 1887. It is to be 35 miles long, depth 26 ft., bottom width of 120 ft., and three sets of locks, at an estimated cost of nearly \$30,000,000. Owing to a bar at the mouth of the Neva, ships have never been able to reach St. Petersburg, but this has been obviated by a canal from Kronstadt to the capital, finished in 1884, at a total cost of \$7,200,000. It is $18\frac{1}{2}$ miles long, 22 ft. in depth, and with a bottom width 275 ft., except near St. Petersburg, where it is only 207 ft. The canal systems of Canada are among the most important in the world. Of these, the St. Lawrence stands first, with its Welland canal $26\frac{1}{2}$ miles long, depth 14 ft., and 26 locks, with a total rise of $326\frac{1}{2}$ ft., and the ship-canal through Lake St. Peter, admitting vessels of $27\frac{1}{2}$ ft. draught, or the largest merchant vessels afloat; also the Richelieu and Lake Champlain system, which, with the rivers and lake, and the Champlain canal, in New York, forms an inland water communication between Montreal and New York, a distance of 457 miles. A plan for utilizing the St. Lawrence system for steam communication between England and Chicago is now under consideration. For Cape Cod canal, see MASSACHUSETTS. The Black Sea and Azov canal, another between the Mediterranean and Red seas, and a plan for flooding a portion of the great African desert south of Algeria by a canal from the Mediterranean, are some of the most important schemes now under consideration.

Since the great extension of railroads in the United States, the building of canals has been almost suspended, except for mining or manufacturing purposes.

For purposes of transportation, few have been commenced and very few enlarged or improved within the past half-century. The whole length of canals in the union is about 4,200 m., of which New York has over 1300 m., Pennsylvania 920, Ohio 800, Indiana 374, Virginia 225, etc. The most important is the Erie in New York, 363 m. long, connecting lake Erie with the Hudson river, finished in 1825 and enlargement finished in 1862, at a cost of more than \$50,000,000. The other large canals are the Delaware and Hudson, the great coal route to New York from the Pennsylvania mines, 108 m. long, completed in 1829, cost \$6,300,000; the Chesapeake and Ohio, 185 m., cost \$11,375,000; the Schuylkill Coal and Navigation company's canal, 108 m., cost \$13,207,000; and the Wabash and Erie, in Indiana, 374 m., cost \$6,000,000. There are 13 canals in New York, 14 in Pennsylvania, 5 in Ohio, 4 in Virginia, 2 in New Jersey, and 1 each in Delaware, Maryland, Indiana, Illinois, and Michigan. The Chesapeake and Ohio canal originated in a project formed by Washington as early as 1774, to make the Potomac navigable from tide-water to Cumberland, and to connect it by common roads and portages with the affluents of the Ohio w. of the Alleghanies. The war of the revolution postponed the scheme, but in 1784 it was again broached by Washington, and Maryland and Virginia appointed a joint commission, with him at the head, to investigate the subject. The result was the incorporation of a company to make the Potomac navigable from tide-water to the highest possible point by the construction of such locks as might be necessary for that purpose. Of this company Washington was the president until his election as president of the United States compelled his resignation. The project encountered many obstacles, until at last in 1820 it was abandoned as impracticable; when the board of public works of the state of Virginia took steps which led to the organization of a new company, which constructed the Chesapeake and Ohio canal from Georgetown to Cumberland, completing it in 1850. It passes through the Potomac valley to Paw Paw Bend, from which point it passes through the mountain by a tunnel 3,118 ft. long. The whole length of the canal is 184 m., its depth 6 ft., its width to Harper's Ferry 60 ft. at the surface and 42 ft. at the bottom. By means of 74 locks, 100 ft. long and 15 ft. wide, an elevation of 609 ft. is gained. All the water is supplied by the Potomac. The cost of the work was over \$11,000,000.

In 1891 steps were taken by the government looking to such a connection and extension of the different water-ways of the country as would give complete internal communication by water between the chief naval centres of the East—a matter of great military importance in case of foreign war and the blockade of our coast.

CANALETTO, or **CANA'LE**, the name of two Venetian painters, who have acquired a reputation for their landscapes and views of towns. The elder, **ANTONIO C.**, b. 1697, was the son and pupil of a theatrical decorator in Venice. He studied at Rome. He painted a numerous series of excellent views in Venice, among which that of the great canal are especially admirable for their fresh coloring, faithfulness, and the invention displayed in accessory objects. He came to England by the advice of Amiconi. He died in 1768, after having acquired both wealth and fame by his representations of English scenes, several of which are in Buckingham house, and are highly admired.

BERNARDO BELLOTTO, surnamed **CANALETTO**, nephew and pupil of Antonio, was b. at Venice, 1724, and attained high excellence as a painter, and also as an engraver on copper. He practiced his art in his native place, and afterwards in Rome, Verona, Brescia, Milan, and Dresden. Correct perspective, powerful effects of light and shade, and beautiful sky-tints, are the most prominent characteristics of his works. C. visited England, where, among several other excellent works, he painted a masterly interior view of King's College chapel, Cambridge. He died in Warsaw, 1780.

CANANDAIGUA, a village and co. seat of Ontario co., N. Y.; at the n. extremity of Canandaigua lake, 28 m. s.e. of Rochester, on the New York Central railroad, and the terminus of several lines of steamers. The village is celebrated for picturesque scenery and the elegance of its private residences. Among the public buildings are a fine courthouse, two orphan asylums, several churches, Canandaigua academy, and Granger Place School for Girls. There are banks, library and museum, electric lights and street railroads, water works, and sewerage system. Pop. '90, 5868.

CANANDAIGUA LAKE, in Ontario co., N. Y., 15 m. long by about 1 m. wide, 668 ft. above the tide and 437 ft. above lake Ontario, into which it is emptied by the Clyde and Seneca rivers. It is surrounded with high banks and charming scenery, and its steamboats are largely patronized by pleasure-seekers.

CANANORE, a seaport and military station of the district of Malabar, in the presidency of Madras. It is in lat. 11° 52' n., and long. 75° 26' e., being about 50 m. to the n. of Calicut. The town stands at the head of a bay, which, opening from the s., forms its harbor, while the fort and cantonments occupy the bluff headland, which shelters the inlet on the side of the Arabian sea. Besides pepper, grain, and timber, the neighborhood produces immense quantities of cocoa-nuts, which are largely exported to the northward, where they are said to be scarce. C. has been a British possession since 1791, having in that year been taken from Tippoo Sultan. Pop. '91, 27,400.

CANA OF GALILEE, called by the natives "Kefr Cana." This place, celebrated in Scripture as the scene of our Lord's first miracle, when he turned water into wine, is now a small village of a few hundred inhabitants, who are principally Greek Christians or Nazarenes, situated about 13 m. w. of the sea of Galilee, and 6 m. n. of Nazareth. At the entrance to the village there is a fountain of the clearest and most delicious water—the best, say the Christians of Palestine, in the world; from it, it is supposed, the vessels for the marriage-feast were filled; and near the fountain are also lying the fragments of a Roman column. A house is still shown as that in which the miracle was performed; and some earthen jars sunk into the floor are said to be the very jars in use on that day. A church was built over the spot, but it is now in ruins.

CANARD, a hoax, cheat, an absurd and sensational story. The origin of this application of the word *canard*, duck, is uncertain. Some derive it from the old phrase *vendeur de canard à moitié*, literally one who sells half a duck; that is, pretends to sell a duck, but cheats during the transaction; while others attribute its origin to the following marvelous tale, circulated by Cornelissen in order to try the gullibility of the public: Having at one time twenty ducks in his possession, he killed them one by one and gave their bodies to the diminishing number of survivors, who successively devoured them, until one out of the twenty was all that remained, and he had actually eaten his nineteen comrades. A corresponding expression in the United States is the term *roorback*, a fictitious narrative published for purposes of political advantage. It originated in 1844 from a story of some notoriety purporting to be an extract from the "Travels of Baron Roorback."

CANARIE, an antiquated dance supposed to have come from the Canary islands. Two persons danced before each other with extravagant gestures. It was a favorite dance in France in the time of Louis XIV., and it is mentioned by Shakespeare. The canarie is a species of gigue resembling the *loure*, only quicker in tempo. A good example is in the second suite of Couperin's *Pièces de Clavecin*.

CANARIES, or CANARY ISLANDS, a group of islands belonging to Spain in the Atlantic ocean, off the n.w. coast of Africa, in lat. 27° 40' to 29° 25' n., and long. 13° 25' to 18° 16' w., forming a Spanish province. The group consists of seven large and several small islets, with a joint area of about 2,808 sq. m., and a pop. of (1887) 291,625. The principal islands, proceeding from e. to w., are Lanzarote, Fuerteventura, Gran Canaria, Tenerife, Gomera, Palma, and Hierro or Ferro. The coasts are steep and rocky, and the surface is diversified with lofty mountains (the greatest elevation being attained in the *Pico de Teyde*, in the island of Tenerife, which has a height of 12,182 ft.), narrow gorges, and fertile valleys. All the islands are of volcanic origin. On the summits of the highest elevations, depressions, like those left by fallen cones of volcanoes, are almost everywhere found; and the steep declivities are marked by deep fissures, of which, usually, only one penetrates the depressed summit, and exposes to view the several strata of the volcanic rock. There are numerous torrents, but no rivers, and fresh water is very scarce in the southern parts of the islands, and especially in Hierro.

The researches of Humboldt and Von Buch led to the division of the botanical geography of Tenerife into five distinct regions. The first, or region of African forms of vegetation, extends to about 1300 ft. above the sea, and is marked by the growth of the date palm, sugar-cane, dragon's-blood tree, etc. The second region extends to the height of 2,800 ft., and produces vines, corn, maize, olives, chestnuts, etc., in luxuriance. This zone represents the vegetation of southern Europe. In the third region, rising 1200 ft. or so higher, we have laurels and evergreens. In the fourth, extending to above 6000 ft., we find vegetation nipped by cold and excessive dryness, snow falling several months of the year, and only the *pinus Canariensis* and other coniferæ flourishing. The fifth region attains an elevation of nearly 11,000 feet. Here are found a kind of *spartium* (broom) peculiar to this zone, with cedrine junipers, and one Alpine plant, *Arabis Alpina*. The barren mountain-peaks are just below the limit of perpetual snow, although in a cavern at the height of 11,000 feet above the sea, snow is said to be preserved throughout the year. All the rest of the islands are similar in character, with the exception of Fuerteventura and Lanzarote, which are less elevated, more abundantly wooded, and more luxuriant in vegetation generally.

Minerals are few, and of little importance. Near the sea, the general temperature ranges from 60°–66° F. in Jan., to 78°–87° F. in October. The rainy season lasts from Nov. to Feb.; from April to Oct., the weather is uniformly fine. The islands, however, suffer much from the e. and s.e. winds, which, blowing over the hot deserts of Africa, burn up vegetation, and generate disease. Very little wine is now produced, the grape disease having destroyed almost all the vines. Cactus plants, on which the cochineal insect feeds, now mainly occupy the desolated vineyards, and the value of cochineal exported has constituted the larger portion of the total value of the exports. Other products are cereals, tobacco, potatoes, barilla, oil, and fruits. The chief foreign trade is with the United States, England and Hamburg. There is little manufacturing.

TENERIFFE, the largest island of the group, has an area of 752 square miles, with a population of 108,081. In the n.w. of this island, which is the principal seat of the cochineal cultivation, is situated the famous Pico de Teyde, or peak of Tenerife (q.v.).

The chief town and port is Santa Cruz de Santiago on the n.e. coast. See SANTA CRUZ (Teneriffe).

GRAN CANARIA, which is next in importance, has an area of 531 sq. m. Its culminating peak is El Cumbre, with a height of 6,648 feet. The capital, Las Palmas (q.v.), on the e. coast, is the largest town of the archipelago.

PALMA has an area of 280 sq. m., and a pop. of 39,600. Its highest peak, Pico de los Muchachos, has an elevation of more than 7,600 feet. Capital, Santa Cruz de la Palma (q.v.), on the e. coast.

For administrative purposes the Canaries are reckoned as a part of Spain, and form the province of Canarias.

The C. are supposed to have been the Fortunate Islands of the ancients. The Carthaginians are said to have visited them, and Juba II., king of the two Mauritaniae, wrote an account of them that has been transmitted to us by Pliny. In modern times, the first account of them was furnished in the first half of the 14th c., by the crew of a vessel that had been driven among them by stress of weather. A Spanish gentleman obtained a grant of them from the pope; but when an attempt at settlement was made, the Spaniards were driven off by the natives. In the beginning of the 15th c., the Spaniards succeeded in obtaining a footing in the islands; but a difference having arisen with Portugal concerning them, it was not until 1493 that the authority of Spain was finally established. Since that time, they have remained attached to the Spanish crown. The Guanchos, Berberes, and the natives of Hierro and Palma were the aboriginal tribes, but they have ceased to exist as distinct races, having amalgamated with Italians, Portuguese, Spaniards, Africans, Flemings, and Irish. They were a brave and intelligent race. See Pegot-Ogier, *The Fortunate Islands* (Eng. trans., 1882).

CANARIUM, a genus of trees of the natural order *amyridaceae*, natives of the south-eastern parts of Asia, the Malayan archipelago, etc. The fruit is a drupe. The kernel of the fruit of *C. commune* is eaten both raw and roasted; and in Amboyna, bread is made of it, which is generally in the form of rolls about a yard long and an inch thick. An oil is expressed from it, which is used both for the table and for lamps. The tree is about 50 ft. high. *C. sylvestre* also produces eatable kernels. *C. commune* is supposed to be one of the trees which yield elemi (q.v.), and *C. microcarpum* yields an oil very like copaiva, known in ship-building yards as dammar (q.v.).

CANARY, or CANARY BIRD, a beautiful little bird, very common as a cage-bird, and much esteemed for its musical powers. It is one of the numerous family of finches (*fringillidae*), and is *fringilla canaria* of Linnaeus. Some modern ornithologists place it in the genus *carduelis*, others in *linota*; it is indeed intermediate between these genera, the goldfinches and the linnets. Some make it the type of a genus or sub-genus, *canaria*. It is found in Madeira, the Canary isles, and the Cape Verd isles; frequents the neighborhood of human habitations; builds its nest of moss, feathers, hair, etc., in thick, bushy, high shrubs or trees; and produces four, five, or even six broods in a season. In its wild state, its plumage is greenish, or greenish-yellow, sometimes tinged with brown, and exhibits less variety and beauty than in domestication. It was brought to Europe in the beginning of the 16th century. It breeds readily in confinement, and seems thoroughly reconciled to its cage-life; but although canaries of long domesticated races sometimes excel in imitative powers and acquired strains, yet they are surpassed in loudness and clearness of note by some of the wild birds, which, when caught and imported, are occasionally sold for extraordinary prices. Even in confinement, the C. often breeds four or five times a year, laying from four to six eggs each time. The eggs are pale blue. The male assists the female in building the nest and in feeding the young. Besides seeds of various kinds, which are their principal food, canaries are very fond of bland green leaves, such as those of chickweed, a supply of which is very necessary for their health; and one of their favorite luxuries is sugar. The C. not unfrequently lives 15 or 16 years. It can be taught various notes and airs, and some even learn to articulate words. The rearing and training of canaries afford occupation to no small number of persons, particularly in the Tyrol. The C. hybridizes readily with some other species of finch, producing "mules," some kinds of which are valued as song-birds.—There are several species very closely allied to the C., one of which, a beautiful little bird, entirely yellow, with an orange crown, a native of Brazil, is sometimes sold in America as a song-bird, but its musical powers are very inferior to those of the common species. See work by Gedney (1884).

CANARY GRASS, *Phalaris canariensis*, a grass of which the seed is much used, under the name of *Canary seed*, as food for cage-birds, and which is, on that account, cultivated to some extent in the s. of Europe, and in certain districts of Germany and England. It is a native of the Canary islands, naturalized in the s. of Europe, and in many places in Britain. The chief seats of its cultivation in England are the counties of Kent and Essex. The seed is sown early, generally in Feb., yet the crop is not reaped till after the ordinary grain harvest, for which reason the cultivation of C. G. is seldom attempted in the northern parts of Britain.—This grass attains a height of 2 or 3 ft., and has a crowded, egg-shaped, spike-like panicle, from an inch to almost 2 in. long; the spikelets are one-flowered, very much laterally compressed, a rudimentary scale-like floret on each side of the perfect floret; the *glumes* winged on the keel, and with two strips of darker green on each side; the *paleæ* awnless, shining, and at last firmly inclosing the seed. A fine flour is prepared from Canary seed, which is employed as dressing in fine

cotton-weaving, and for the finishing of silken stuffs. The groats and flour of this small kind of grain are also used in the Canary islands, in Barbary, and in Italy, as food, the flour being made into bread, which is very nutritious and pleasant.—Other closely allied species of *phalaris* produce a similar grain, but are inferior in productiveness and quality.—A grass, now generally referred to this genus, and sometimes called REED C. G. (*phalaris arundinacea*), is very common on the banks of lakes and rivers, and in other wet places in Britain, and throughout southern and central Europe. It differs very much in appearance from C. G., having a large spreading panicle, generally of a reddish color; and the glumes are not winged at the keel. It is a somewhat reed-like grass, 4 to 6 ft. high, with creeping roots, which help to secure river banks; and yields a great bulk of hay, but has been very generally despised as a coarse grass, fit only for littering cattle. The justice of this opinion has, however, been called in question, and the grass proclaimed to be very nutritious, and sufficiently acceptable both to horses and oxen when cut early. It may be mown twice a year. A variety with curiously striped leaves is well known in gardens, as *ribbon grass*, *gardeners' garters*, or *ladies' traces*.

CANARY PLANT. See TROPEOLUM.

CANARY WINE, also known as TENERIFFE, is the produce of the Canary islands, and resembles Madeira; but the name is properly applied only to the Bidogne wine, which must be distinguished from the Malvoisie of the Canaries. The former is made from grapes gathered before they have ripened, and, when new, is crude and unpleasant; but in the course of two or three years, increasing in mildness as in age, becomes so much like Madeira, that it is often sold for it. Like Madeira, it is greatly improved by a voyage to the tropics. It is produced chiefly on the island of Teneriffe, and the trade in the wine is mostly carried on at the chief port of this island. The Canary of the island of Palma is inferior to Teneriffe, but may be consumed sooner, and has a pleasant flavor.

CANASTER, the name given to a rush basket in which tobacco is placed in Spanish America; hence is said to be derived the name canaster, now applied to tobacco of a certain kind.

CANBY, EDWARD RICHARD SPRIGG, LL.D.; 1819-73; b. Ky.; a graduate of West Point; served in the Florida and the Mexican war, and in the war of the secession; in 1862, made brig.gen. of volunteers, and maj.gen. in 1864. He was severely wounded on two occasions, and was often chosen for special and difficult duty. In 1866, he was commissioned as brig. in the regular army. In the winter of 1872-73, he was sent to make a settlement of the difficulties between the Modoc Indians and the whites of n. California and Oregon, and was holding a talk under a flag of truce near his camp when he was treacherously shot by Capt. Jack, one of the Modoc leaders.

CANCALE, a seaport of France, 10 m. e. of St. Malo, on the bay of St. Michael; famous for its oyster trade; pop. '91, 6578. In 1758, the duke of Marlborough here landed an English army of 14,000, intending to attack St. Malo, but returned without making the attempt.

CANCAN, a wild dance, or rather a series of violent gymnastic exercises, originated by the demi-monde of Paris. Though perhaps quite as decorously clad as the operaballet, the C. is considered out of the pale of respectable diversions. There is some resemblance between it and the wild orgies of the Bacchic or Dionysian festivals of ancient Greece.

CANCAO, **CANCAR**, or **KANG-KAO**, also known as PONTIAMUS or POTAIMAT, the capital of a small state in w. Cambodia, on the e. side of the gulf of Siam, at the mouth of the river Cancao, 10° 14' n. and 105° 55' east. It was once the center of Cambodian trade, but in 1717 the Siamese drove out the merchants who had settled there, since which time the trade of the town has greatly decreased. The harbor is shallow, but there is a good depth of water in the river.

CANCELING OF DEEDS AND WILLS. The word cancel comes from the Lat. *cancelli* (lattice-work), and a deed was formerly said to be canceled when lines were drawn over it in the form of lattice-work. The word cancel is now used to signify any sort of obliteration.

The court of chancery in England gives relief against the effect of improper cancellation; on the other hand, it may order a deed which has been improperly obtained to be delivered up in order to be canceled. The effect of the cancellation is to make the deed void. If a deed is given up to be canceled, and the cancellation does not take place, it remains in force at law. But if an obligee deliver up an obligation to be canceled, and the obligor do not afterwards cancel it, and the obligee happen to get it again into his hands, and sue the obligor on it, the latter cannot plead its voidance, for the deed still remains in force at law—although here, too, equity would relieve, and decree according to the original cancellation. Where a deed is canceled by consent of the parties to it, it is thereby destroyed as to their interest under it, but third parties may still produce it in evidence. As to a will, its cancellation may have the effect of revoking it, if done with such intention.

In Scotland, the system of registration of deeds and other writings prevents the occurrence of many of the questions that arise in England on this head, but the intention and effect of the cancellation or destruction of documents would in most cases be a question of evidence; and where it is necessary to know the contents of the destroyed paper, its effect may be judicially declared by a form of suit called an action for *proving*

the tenor, as indeed may be done in an English court of equity by a bill to recover the contents of a lost document. In the Scotch law, again, a deed or other writing may be judicially canceled or set aside by an action of reduction, and the courts in England substantially exercise a similar jurisdiction.

It would appear that where a testator has prescribed certain forms for the authentication of his will, and such forms have either not been observed by him, or if observed, have, in some essential particular, been negatived by obliteration, an intention to revoke will be presumed. It is within the jurisdiction of the courts of the U. S. which possess chancery powers to order the cancellation of a deed. But where a deed has been properly executed and delivered, its mere cancellation will not divest the grantee's title. The Statute of Frauds provides that the cancellation of a will must be by the "testator himself or in his presence, and by his direction and consent." This is true in many states of the U. S. Cancellation to be effectual must be in accordance with the statute. In N. Y. a partial obliteration is not sufficient, but the will must be destroyed or formally revoked. Cancellation by an insane man will not revoke a valid will. There must always be the *animus revocandi*, and accidental cancellation is not a revocation.

CANCELING OF LETTERS-PATENT. The lord chancellor may cancel the queen's letters-patent, when granted contrary to the law, "which," says Blackstone, quoting sir Edward Coke, "is the highest point of his jurisdiction." See LETTERS-PATENT, CHANCELLOR.

CANCELLARIA, a genus of mollusks—class *gasteropoda* (q.v.), order *pectinibranchiata*—with univalve shells, sometimes regarded as belonging to the family *volutidae*, or volute shells (q.v.), but now generally placed among *buccinidae*, or whelks (q.v.). The spire is prominent, the last whorl ventricose, the surface reticulated, the mouth large, the columella plaited. All the recent species are natives of tropical or subtropical seas, and are found chiefly on sandy bottoms, at the depth of a few fathoms. The fossil species, amounting to 19, occur in the newer strata from the chalk upwards.

CANCER, a disease characterized by slow alterations of structure, or tumors in various parts of the body, occurring either simultaneously or in a certain order of succession. In many cases, an isolated tumor in an external part is the earliest symptom; it is then viewed as the starting-point of the disease, and is termed a *malignant tumor* (*tumor mali moris*), from its presumed tendency to infect the system, and to cause the reproduction of growths similar to itself. It is right, however, to remark, that upon the pathology of C. authorities are by no means agreed, some holding that a constitutional taint or *diathesis* must always precede any local development of C., and that the first growth in point of time (or primary C.) is therefore only the first of a series determined by a pre-existing cause in the blood or general system; while others hold that C. is originally a truly local disease, or even that a growth at first simple (*non-malignant* or *benign*), may, in consequence of local causes, *degenerate*—i. e., become cancerous, and infect the whole system with the morbid tendency thus secondarily acquired. The discussion of this disputed question involves statements of a too complicated kind to be in place here; but it is a question of considerable importance, as bearing on the probability or improbability of curing the disease by extirpating the primary tumor at an early stage of its development. All authorities are agreed that, when any trace of secondary C. exists, the removal of the parts affected gives scarcely any hope of a favorable result, and, accordingly, operations under these circumstances, unless merely for the relief of local suffering, are discountenanced by all respectable surgeons. The disease, however, is one of which the ignorant as well as the learned have a well-founded dread, and hence it presents a large field for the practice of imposture, and for that less deliberate, but often not less hurtful kind of quackery which is the result of pure ignorance, grafted on a meddlesome desire to do good. We propose to give such a sketch of the characters and progress of cancerous disease as may serve, in some degree, as a protection against ignorance on the one hand, and deception on the other.

The leading character of C. being a tumor or morbid growth in a part, it is important, in the first place, to observe that not all, nor even the majority, of morbid growths are cancerous. A very large proportion of growths, involving swelling or change of structure in a part, are either determined by a previous process of inflammation—leading to chronic abscess and induration—or belong to what is called the non-malignant order of tumors—e. g., cysts, fatty and fibrous tumors, simple hypertrophy of glandular structures, cartilaginous, bony, calcareous, and vascular growths. See TUMORS. Further, among the tumors admitted by general consent into the order of cancerous, there are widely different degrees of *malignancy* or *cancerousness*, so to speak; some having the tendency to spread rapidly, and infect the system at an early period, while others remain local for a considerable time, and may be removed while yet local, with good hope of a permanent recovery.

Now, the practical distinction, or *diagnosis*, to use the technical phrase, of these different tumors, is founded upon a very careful and delicate appreciation of the characters of the malignant and non-malignant tumors, considered as morbid products, and also upon a thorough knowledge of the anatomy and relations of the textures in which they arise. One of the leading characters of malignant tumors is the tendency to involve, by a kind of specific destruction or degeneration, the ultimate elements of the textures in which they arise and in which they spread. The attempt, therefore, to distinguish these from other growths, must always call for the highest qualities of the surgeon—large

experience, guided at every step by consummate science, and, in particular, by minute and thorough knowledge of natural structure. And the difficulties of the inquiry are such, that even in the dead body, or in a tumor excised from the living body, all the resources of the anatomist, aided by the microscope, will occasionally fail in distinctly and surely discovering the true character of the morbid structure.

The most common seats of C. are, among external parts, the female breast, the eye, the tongue, the lip, the male genital organs, and the bones; among internal organs, the liver, stomach, uterus, rectum, gullet, peritoneum, and lymphatic glands. Some of these parts are more liable to primary, others to secondary cancer. Thus, the female breast, the neck of the uterus, the lower lip, the scrotum, the extremity of the penis, are very often the seats of a single cancerous tumor, which in its early stage at least seems to be unconnected with any constitutional taint; while the liver, the bones, and the lymphatic glands are more frequently the seats of secondary or multiple cancerous tumors. There are also differences in the character of C. itself, apart from its anatomical seat, which are to be taken into account in estimating the probability of its being solitary. Some of these differences are regarded by pathologists as amounting almost to specific distinctions; thus, *scirrhus*, or hard C., observed most frequently in the breast, uterus, and stomach, is more frequently solitary than *encephaloid* (brain-like), otherwise called *medullary*, or soft C.; again, *melanosis*, or *melanic C.*, a variety charged with a brown or black pigment, is almost always multiple in its occurrence; while *epithelial C.*, or *epithelioma*, as it has been recently termed, of which examples are frequently found in the lip, scrotum, penis, or tongue, is so generally solitary as to have led some pathologists to place it in a class altogether apart from the truly cancerous growths, with which, however, it presents too many points of affinity in its fatal tendency to recur after operation, and to infect the lymphatic glands and other structures adjoining the part primarily affected. Again, there are certain varieties of fibrous and of cartilaginous tumor, as well as certain tumors of bone, and bone-like tumors developed in soft parts (osteoid), which must be regarded, in the meantime, as occupying a doubtful position between the malignant and non-malignant growths.

Generally speaking, a tumor may be said to fall under the suspicion of being C. when it more or less completely infiltrates the texture in which it arises, and passes from it into the surrounding textures; when it invades the lymphatic glands adjoining the part first affected; when it is attended by stinging or darting pains, or by obstinate and slowly extending ulceration, not due to pressure; when it occurs in a person having impaired health, or past the middle period of life, and is not traceable to any known cause of inflammatory disease or local irritation, nor to any other known constitutional disease, such as syphilis or scrofula. The probabilities are of course increased if the tumor be in one of the habitual seats of C., or if it be attended by evidence of disease in some internal organ known to be frequently thus affected. But it is hardly necessary to point out that the very complex elements of *diagnosis* here referred to ought to be always submitted to the scrutiny and judgment of a well-educated medical adviser, whose skill and personal character place him above suspicion, before the disease has assumed such a form as to be beyond the reach of remedial procedure. The patient who broods in secret over a suspicion of C., or who declines to apply for advice from a fear of encountering the truth, is in all probability only cherishing the seeds of future suffering; while if, as often happens, the suspicion is unfounded, a few minutes' careful examination would suffice to remove a source of misery which otherwise would poison the mind for years.

These remarks apply still more emphatically to the misguided persons who trust to the non-professional *cancer-curer*, or to the quasi-professional specialist. The charlatan, who pretends to hold in his hands a secret remedy for this most terrible disease, will invariably be found to pronounce almost every tumor C., and every C. curable. By this indiscriminating procedure, and by the fallacious promise of a cure without an operation, many persons who have never been affected with C. at all, have been persuaded to submit to the slow torture of successive cauterizations by powerful caustics, at the expense of needless mutilation and no small risk to life. In other cases, truly cancerous tumors have been removed slowly and imperfectly, at the cost of frightful and protracted sufferings, only to return at the end of a few weeks; and Mr. Spencer Wells has lately shown that in some notorious instances persons were reported as cured, when they had actually died of the disease at no long period after the supposed cure was stated to have taken place.

What is really known as to the cure of C., may be stated in few words. Modern pathological researches render it probable that a complete suspension of the progress of C. sometimes, though rarely, takes place; and individual tumors are found not unfrequently to undergo partial healing, or even to become entirely metamorphosed into inert cicatrices, while others, associated with them, continue to advance. The degree of rapidity of the advance of C. is also, as we have already stated, exceedingly variable. But these observations modify only to a very slight degree the general doctrine, that C. is a disease tending to a fatal issue, and hardly, if at all, under the control of remedies, as to its ultimate result. The removal of a cancerous tumor, indeed, is still resorted to by surgeons; and there appears to be no reasonable doubt that, when performed early, and in well-selected cases, it has been followed by long-continued exemption. But the occasional spontaneous arrest of such growths on the one hand, and the doubtful results

of operation in a large proportion of cases on the other, have combined to render surgeons of late years more chary of the use of the knife. In aged persons, in particular, the question often resolves itself into a calculation of the chances of life, founded on a great number of conflicting data, and only to be solved by a careful attention to the state of the general health, as well as to the rate of progress of the local disease. Operations are now very rarely performed after the lymphatic glands are involved, or when there is evidence of a deteriorated constitution, or of internal disease; but sometimes great pain, or profuse and exhausting discharge from an external tumor, may justify its removal, as a palliative measure, even under these unfavorable circumstances. For the mode of removal of cancerous and other tumors, see TUMORS.

Among the lower animals, this disease is more rare; nevertheless, cases are not unfrequent, presenting the same malignant characters as those observed in the human subject. Usually manifesting itself in the form of a specific tumor of some organ or tissue, there is a tendency to the invasion of other parts of the system, and the development of a constitutional state called the cancerous cachexia. M. U. Leblanc of Paris, the best veterinary authority on this subject, has shown that the dog and cat are most frequently affected with C.; and next in frequency come the pig, ox, horse, and mule. It has not been observed in birds, reptiles, or fishes. Females are more liable to C. than males. It is hereditary, but not transmissible from animals to man, or from one animal to another. It does not disappear under the influence of remedies, but, if possible, the tumors should be excised when first seen, and, if the knife fail to extirpate the malady, cauterization should be had recourse to. A relapse is almost certain; but Leblanc says there is greater chance for the patient, when a carnivorous animal, if it is kept on a strictly vegetable diet.

CANCER, the *Crab*, the fourth of the twelve constellations of the zodiac, usually represented on the globe as a crab, and denoted in works on astronomy by the sign ♏ , which resembles the number 69 laid sideways. It contains, according to Flamsteed, 83 stars, of which the principal is *Acubens*, a star of the third magnitude. In the divisions of the ecliptic, the *sign* called C. occupies a place between 90° and 120° from the vernal equinox; but, owing to precession, the sign and the constellation have not coincided for nearly 2,000 years. See ECLIPTIC, PRECESSION, ZODIAC. Besides *Acubens*, it has two stars of the fourth magnitude, called by the Romans *Aselli* or the Little Asses; and a nebulous cluster of minute stars about 2° from the Asses, visible to the naked eye, and which goes by the name of *Præsepe*, or the Manger.

CANCER. See CRAB.

CANCER, TROPIC OF. See TROPICS.

CANCER ROOT, or BEECH-DROPS, *Epiphegus Virginiana*, a parasitic plant of the natural order *orobanchææ* (q. v.), a native of North America, growing almost exclusively on the exposed roots of beech-trees. Like all the other plants of its order, it has a curious appearance, having scales instead of leaves. Its stem is branching, and produces distant alternate white flowers, streaked with purple. The whole plant is powerfully astringent; and the root is brownish, spongy, and very bitter and nauseous in taste. It has acquired, in its native country, the reputation of being a cure for cancer. All parts of the plant are used, and externally more than internally. This plant, in conjunction with white oxide of arsenic, is believed to have formed a medicine once famous in North America under the name of *Martin's cancer-powder*.—Another American plant of the same order, *Phelipæa biflora*, is sometimes also called C. R., and is used in the same way; and an infusion of the common broomrape (*orobanche major*)—a native of Britain and of the s. of Europe, parasitic on the roots of broom, furze, and other leguminous plants—has been employed as a detergent application to foul sores.

CANCERIN', GEORG, Count, 1774–1845; a Russian statesman, educated in Germany, and employed in various capacities in Russian service. In 1813, he was commissary-gen. of all the forces, and in 1814, he accompanied the emperor Alexander to Paris. He was minister of finance from 1823 until his death. He was one of the few Russian writers on political economy.

CANCERUM O'RIS, known also as *noma*, *water-cancer*, and *water-canker*, is a peculiar form of mortification, arising apparently from defective nutrition. The disease seldom occurs except between the 2d and 11th years, and is usually preceded by measles, remittent or intermittent fever, or some other serious disease. The following is the ordinary train of symptoms: more or less general disturbance of the system, accompanied by loss of appetite, followed by swelling of the salivary glands, and a profuse flow of saliva, which escapes from the mouth involuntarily during sleep; ulceration of the gums, which swell and become livid; looseness of the teeth; and the appearance of ash-colored spots on the gums and adjacent mucous membrane, which turn into dark-colored sloughy sores. These sores spread rapidly by a gangrenous process, expose the bone, and finally make a large aperture in the cheek. In some cases, the entire cheek has been destroyed in a very few days. Fortunately, this terrible disease is more rare in this country than in some parts of the continent, and most of the cases recorded are described by foreign writers. Van Swieten describes a case in which he saw the first set of teeth fall out, the second set destroyed, the lower jaw exfoliated, and the lips, cheeks, tongue, and chin eaten away before the child died. The obvious indications of treatment are to remove the patient to pure air, to administer tonics, nourishing food,

and (in moderation) stimulants; to touch the diseased parts with nitrate of silver, or glyceride of carbolio acid, and to wash out the mouth frequently with a weak solution of Condy's fluid.

CANDACÉ, queen of the portion of upper Nubia called by the Greeks Meroë, probably corresponding with the present province of Athbara, between 13° and 18° north. From its fortunate situation, Meroë became one of the richest countries in the world. Candace appears to have been the name of several female rulers in Ethiopia. The one here meant invaded Egypt 22 B.C., but was defeated by the Roman governor, Petronius, who destroyed Napata, the queen's capital city. The queen was leniently treated by Augustus. The high chamberlain or treasurer of Candace was converted to Christianity by Philip the Evangelist, and there is a tradition that through the efforts of this officer the queen herself was converted.

CANDAHAR, or **KANDAHAR**, the capital of central or southern Afghanistan, situated about 200 m. to the s.w. of Cabool. It is in lat. 32° 37' n., and long. 66° 20' e., and has an elevation of 3,484 ft. above the level of the sea. It is in the form of an oblong square, while all its streets run straight, and cut one another at right angles. At the point of intersection there is a large dome (*chairsu*), 50 yards in diameter. Pop. variously estimated from 60,000 to 100,000. C. is well watered by canals drawn from a neighboring river, which send to almost every street its own adequate supply; and the same means of irrigation have covered the immediate vicinity with gardens and orchards. C. is a place of great commerce, trading with Bombay, Herat, Bokhara, Samarcand, etc. About 2 m. to the northward rises a precipitous rock, crowned by a fortress impregnable to everything but heavy artillery. Here, amid all the disasters of the Afghan war, the British maintained their ground. C. has been a pivot for the history of Central Asia during more than 2000 years. It is supposed to have been founded by Alexander of Macedon, owing, most probably, its name to the oriental corruption of Iskender or Scander, as in Scanderoon or Iskenderun of Syria. A comparative blank of upwards of 13 centuries in the history reaches to the famous Mahmoud of Ghiznee, who wrested the stronghold from the Afghans. From that epoch down to 1747, when the native rule was permanently established, C., with brief and precarious intervals of independence, was held by Tartary, India, and Persia in turn. In the war of 1878-79, the British entered C. unopposed.

CANDAULES. See **GYGES**.

CANDEISH, or **KHANDESH**, a collectorate in the presidency of Bombay, containing 9944 sq. m., with a comparatively scanty pop. of about 1,250,000. It lies chiefly in the valley or basin of the middle part of the Tapti, which enters the gulf of Cambay below Surat; and it is bounded mostly by territories of nearly all the powerful native princes—the Nizam, Scindia, Holkar, and the Guicowar. Through its situation, it necessarily suffered much from the long contest between the Mohammedans and the Mahrattas, and also from the struggles among the rival chiefs of the latter. Accordingly, when, in 1818, it fell to the East India company on the overthrow of the Peishwa, it presented little better than a scene of desolation, with ruined mansions, dismantled towns, and dilapidated temples. The difficulties of the new government were considerably aggravated by the Bheels, a more than half-savage race.

CANDELA, a t. of southern Italy, province of Foggia, 22 m. s. of the town of Foggia. Pop. 5,000. It is pleasantly situated on the summit of an eminence. The surrounding district is very fertile.

CANDELA BRUM, a Latin word signifying properly a candlestick (from *candela*, a candle), but more frequently employed to mean a support for a lamp. There were, perhaps, no articles of furniture in which the ancients combined the beautiful with the useful to so large an extent as in their candlesticks and lamps. Candelabra usually stood on the ground, and were of considerable height—from 4 to 8, or even 10 feet. The most common were of wood; but metals of all kinds, including the precious metals, were used for their construction, and sometimes they were even adorned with gems. The candelabra found at Herculaneum and Pompeii are mostly of bronze. In the temples and palaces of the emperors, they were frequently of marble, and of great size and richness. They have usually a capacious cup at the top, either for the purpose of containing oil enough to feed a large flame, or that they might be used for burning incense. Though varying greatly in details, a general design runs through the forms of the candelabra of antiquity. They have all a foot or feet, a shaft, and a plinth on which a lamp is placed, or which is furnished with a socket for a candle. The base often consists of three feet of a lion, goat, griffin, or other animal real or imaginary. Sometimes a figure was introduced either into the body of the shaft, or placed on the top of it, in either case supporting the superincumbent portion of the C. on its head. Sometimes a figure was substituted for the shaft altogether, the receptacle for the oil being placed in one hand. In others, the shaft is a sliding one, like that of a music-stand, the object being, of course, to raise or depress the light at pleasure.

In addition to the various kinds of candelabra which, from their height, seem to have stood on the floor, the ancients had others intended to be placed on a table. These consisted either of a pillar or of a tree, and from the capital of the former, or the branches of the latter, lamps were suspended, as in the accompanying illustration, which we

copy from Smith's *Dictionary of Greek and Roman Antiquities*. The C., in this instance, including the stand, is only 3 ft. high. From the size of the stand in proportion to the rest of the C., it would seem to have been used for some other purpose.

CANDIA, in Turkish, "KIRID'," called in the most ancient times *Idaea*, afterwards *Crete*, one of the largest islands of the Mediterranean, is situated at the entrance of the archipelago, in long. $23^{\circ} 40'$ to $26^{\circ} 40'$ e., lat. $34^{\circ} 50'$ to $35^{\circ} 55'$ n. It is very irregular in form, its length being about 150 m., and its breadth varying from 6 to 35 m.

The island of C. is for the most part mountainous, the mountains being chiefly composed of freestone or marble, which is either gray or white. Towards the s. side of the western part of the island there is a chain of high mountains, extending in length about $37\frac{1}{2}$ m., which, from their appearing white, especially at their w. end, were anciently called Leuci. Mt. Ida, now called by the natives Psiloritis, is one in a chain of mountains extending to the n.w. of the island almost to Retimo; the mountain is of gray marble, and the surface loose stones: there is no verdure on it except a few small shrubs. Jupiter is said to have passed great part of his youth amongst these mountains in the exercise of hunting and drawing the bow.

The island abounds in springs and fountains, which are found even by the sea-side; most of the rivers are dry in summer, but in winter many of them are very dangerous torrents. The island does not produce any minerals of importance. The soil of C. is fertile. The products are olive oil, wheat, oranges, lemons, silk, wine, raisins, honey, etc. Large quantities of olive oil and soap are exported.

C. had once, according to Homer in his *Odyssey*, 90 cities; there are now only 3 principal towns: Megála Kástron, or Candia, pop. 24,600; Retimo or Rhithymnos, pop. 9000; Canea or Khania, pop. 15,000. The total population of the island, according to estimates based on the census of 1885, is 294,192.

The population is for the most part of Greek descent, about two-thirds of the inhabitants being attached to the Greek church. Among the rest the Turks predominate. There are a few Arabs and Armenians in the island. There are, however, many Greek Moslems in C., the worldly advantages which used to result from embracing Islamism having induced whole districts to abandon the faith of their forefathers; but their change of religious faith was unaccompanied by any change of language.

The history of C. commences with Greek mythology, and historians and poets say that it was governed by its own kings, among whom were Saturn, Jupiter, and Minos, 1300 years before Christ. C. was conquered by the Romans under Metellus, who, on that account, had the title of "Creticus"; on the division of the empire, it fell to the share of the eastern monarchs. In 823 A.D. it was conquered by the Saracens, who built the city of C. on the ruins of Heraclea. In 1204 it was sold by pope Boniface—to whom Baldwin I. gave it—to the Venetians. In 1645 the Turks besieged Canea, and in 1669 conquered the island, after a war which lasted 24 years. The Cretans sigh for a union with Greece, and have repeatedly risen in insurrection against Turkish rule, notably in 1866. At the Berlin congress in 1878, the Porte engaged scrupulously to carry out in C. the reformed system of government drawn up in 1868.

A revolt broke out in 1889 and the Turks withdrew many of the more liberal provisions which they had accepted in the government of the island. The Mohammedan valis ruled Crete from this time on and the discontent of the Christians broke out in another revolt toward the end of 1895. A Turkish attack on the insurgents near Apokorona, December 10, 1895, was unsuccessful, but on receiving reinforcements, the Moslems seized a number of the Christians. The conflicts continued, and in the spring of 1896 the Sultan recalled a decree which he had issued, postponing the meeting of the general assembly. On May 25th, 1896, the Turkish soldiery murdered and pillaged the Christians in the vicinity of Canea, but the insurgents remained in possession of several districts. At last the pressure of the Powers upon the Porte resulted in an order convoking the national assembly at Canea and a Christian was appointed governor-general, though the Turkish governor was retained as military governor. In July a proclamation declaring general amnesty was issued, but the Turkish troops again attacked the insurgents. It was now proposed that the Powers should blockade the island to prevent the insurgents from receiving aid from Greece. England refused to comply with this request. A revolutionary assembly was formed by the insurgents and it was therein decided to await the action of the Powers. Toward the end of August the Sultan gave it out that he would accept the terms recommended by the foreign ambassadors at Constantinople. The terms were the appointment of a Christian governor for five years, subject to the approval of the Powers and in general the autonomy of the island, save for an annual tribute to Turkey. The Sultan agreed to this, but there was much delay in the execution of the reform. The Cretans complained that, though Turkey agreed to introduce such reforms as should be "adjudged equitable," nothing would be done because Turkish promises were never carried out unless enforced by the Powers. Unless, therefore, the Turkish army was withdrawn and Crete annexed to Greece, they had no grounds for supposing that the reforms would ever be introduced, or that the island ever would be pacified. In 1897 the Powers established a "pacific blockade" of the island of Crete, and threatened to blockade Athens, at the same time holding out the hope that new privileges would be obtained from Turkey and that the island would acquire autonomy. In the meanwhile, Greek troops joined the Cretans, and in April, 1897, Greek irregulars, said to be under the leadership of regular officers, became involved in war on the fron-

tiers of Macedonia. On April 14, 1897, the Porte declared that war existed, owing to the aggressions of the Greeks, and this declaration was accepted by the Greek government, which, however, disclaimed all responsibility for the rupture, charging the Turkish troops in Macedonia with being the aggressors. See GREECE.

CANDIA, or **MEGALA-CASTRON**, formerly the capital of Candia or Crete, on the n. shore of the island, 13° 20' n. and 25° 9' east. It is surrounded by fortifications built by the Venetians, but which are now out of repair; and much of the town has also been much injured by earthquakes. Candia occupies the site of the ancient Heracleion, the seaport of Gnossus. The present city was founded by the Saracens in the 9th c.; was fortified in the 12th c. by the Genoese, and greatly strengthened by the Venetians in the following three centuries. It was taken by the Turks in 1669 after a stubborn defense by the Venetians, who lost 30,000 men. Population, about 24,600.

CANDIAC, **JEAN LOUIS PIERRE ELIZABETH DE MONTCALM DE**, 1719-26; a child of wonderful precocity, b. in Nismes, France. At four years of age he read Latin, either printed or written; at six he understood Greek and Hebrew, had a remarkable acquaintance with arithmetic, history, geography, and heraldry, and had read many of the best authors.

CANDIDATE (Lat. *candidatus*). Among the Romans, a suitor for the office of consul, quæstor, prætor, etc., was named C. because, in appearing before the people, he wore a white (*candida*) toga without a tunic. His dress was chosen partly as an ostentation of humility, and partly as it served to display wounds received in battle. The candidature commonly lasted two years: in the first year, the C. was proved by the senate, whose decision, if favorable, was ratified by the popular assemblies; and, in the second, his name was entered in the list of candidates. During this period occurred the *ambitio*, or canvassing of voters, which often gave occasion to enormous bribery, in spite of the severe enactments passed to prevent the corruption of the electors. The elected C. was styled *designatus*.

In the early Christian church, newly baptized converts were styled CANDIDATES, on account of the white garments worn during eight days after baptism. In modern times, a German probationer or theological student who has been approved before the highest ecclesiastical authorities, is called a C.; but a still broader signification is also attached to the word, an applicant for any office whatever, religious or secular, being termed a candidate.

CANDLE, a cylinder of wax or fatty matter, with a wick, intended for giving light. Candles are made principally of tallow; also of the solid portion of palm and cocoa-nut oils, bleached wax, spermaceti, and paraffin, and other oily substances found in coal, shale, and gas-tar. They are either dipped, molded, or rolled. "Dips" are made by stretching a number of wicks upon a suitable frame, so that they may hang down at a distance from each other equal to about double the intended thickness of the C.; these are then dipped in a trough of melted tallow, and hung upon a rack until cooled, then dipped again and again, until the required thickness is obtained. The dipper has a number of frames prepared before commencing, and by the time he has dipped the last, the first is cool enough to dip again. The tallow in the trough has to be kept only a little above its melting point, for if it were much hotter, it would melt away a portion of the tallow already on the wick, instead of adding to it. Tallow-candles are much improved by being kept a year or a winter before using.

Molds, or mold-candles, are cast by pouring the tallow down a pewter tube, along the axis of which the wick has been previously fixed. These tubes are well polished in the inside, and several are fitted in a frame, the upper part of which forms a trough, into which the molds all open: thus, by pouring into the trough, all the molds are filled at once.

Wax-candles are not molded, on account of the great amount of contraction which wax undergoes in cooling, and the difficulty of drawing it from the molds. The wicks are warmed, and suspended over a basin of melted wax, which is poured over them until they acquire the proper thickness; they are then rolled, while hot, between two flat pieces of smooth hard wood, kept wetted to prevent adhesion.

Great improvements have recently been made in the manufacture of candles, and these are especially interesting from being the direct results of the progress of scientific chemistry--of theory applied in practice. All oils or fats are composed of one or more fatty acids combined with a base, called glycerine. The fatty acids constitute the combustible and more solid portion of the compound. Both acid and base are very weak, and it is a general law in chemistry, that a strong base, under favorable conditions, will separate a weaker one from its acid, by combining with the acid, and taking the place of the weak base; and a strong acid will in like manner displace a weaker one. Lime is a strong base, and being cheap, is used to separate the glycerine from the fatty acid of tallow, palm-oil, etc. This it does when the melted fat is stirred for some hours with a mixture of lime and water. The lime forms a hard insoluble soap, by combining with the fatty acid, and the glycerine remains in solution with the water. This lime-soap is then broken to powder; and the weak fatty acid separated by means of sulphuric acid.

which combines with the lime, forming sulphate of lime. The whole being heated, the fatty acid floats on the top, is skimmed off, and the candles made from it. These are called composite candles; they give a purer light than ordinary tallow, from being freed from the glycerine, which not only softens the fat, but diminishes its combustibility. Pure stearic acid, or stearine, the chief fatty acid of tallow, is a hard crystalline substance, perfectly dry, and free from any greasiness, with a somewhat pearly luster. Its crystalline structure presents a difficulty in the manufacture of candles, for when cast in molds, it contracts on cooling, and leaves small spaces between the crystals. This has been obviated by mixing a little arsenic with it; but this method is now abandoned, on account of the poisonous gas evolved by the combustion of such candles, and the desired effect is obtained by mixing the stearine with a little wax, and pouring it into hot molds.

To obviate the necessity of snuffing candles, several contrivances have been adopted; in all of them, the object is effected by causing the wick to bend over and its end to fall outside of the flame, and thus, by coming in contact with the oxygen of the air, to be completely burned—for such combustion cannot take place within the flame. See FLAME. This bending over is variously brought about. One method is by twisting the wick with one strand shorter than the rest, which is strained straight while the candles are being cast; and when released by the melting of a portion, it contracts, and bends the wick. Another method is by adding on one side of the wick a paste, consisting of a mixture of borax, bismuth, flour, and charcoal. Another, by coating one of the threads of the wick with a metallic envelope, by dipping it in fused bismuth; the metal fuses at the end of the burning wick, and forms a small globule, which bends the wick over, and is itself readily combustible at a red heat. These are called *metallic* wicks. Various other contrivances have been adopted for the same object. Price's manufactory of "patent" candles, as these improved candles usually are called, is perhaps the largest in England. It is situated at Vauxhall, in the neighborhood of London, and its economic arrangements have attracted not a little public attention. *Paraffine* (q.v.), a white crystalline body, obtained by distillation from cannel coal, etc., affords a beautifully white and clear material for candles, and having thus in a great degree the properties of wax at a much smaller expense, it has lately been much used for this purpose. *Ozokerit* is another oily mineral substance used for candles.

Candles were early introduced—with symbolical signification—into Christian worship, and are still so employed in the Roman Catholic church. In the church of England, candles are sometimes placed on the altar; but the practice is a subject of controversy. The numerous superstitious notions and observances connected with candles and other lights in all countries had a more remote origin, and may be considered as relics of the once universally prevalent worship of the sun and of fire. Numerous omens are taken from them, and they are also used as charms. In Britain, a portion of the tallow rising up against the wick of the candle, is called a winding-sheet, and regarded as a sure omen of death in the family. A bright spark at the candle denotes that the party directly opposite is to receive a letter. Windy weather is prophesied from the waving of the flame without visible cause, and wet weather if the wick does not light readily. Lights appearing to spring up from the ground, or issue out of a house, and traverse the road or air by invisible agency, the superstitious in Wales and elsewhere call *corpse-candles*. They are ominous of death, and their route indicates the road the corpse is to be carried for burial. The size and color of the light tell whether the fated person is young or old. It is or was customary in some places to light a candle, previously blessed, during the time of a woman's travail. C. were supposed to be efficacious after death as well as before birth, for they were placed on the corpse. The object was doubtless to ward off evil spirits, who were supposed to be always on the alert to injure souls on entering and on quitting the world. See also CANDLEMAS.

CANDLEBERRY, CANDLEBERRY MYRTLE, WAX TREE, WAX MYRTLE, TALLOW TREE, or BAYBERRY, *Myrica cerifera*, a small tree or shrub of 4 to 18 ft. high, but generally a low-spreading shrub, a native of the United States of America, but most abundant and luxuriant in the south. It belongs to the natural order *amentaceæ*, suborder *myricæ*, according to some, a distinct natural order, distinguished by naked flowers, with 1-celled ovary, a drupaceous fruit (stone-fruit)—the scales becoming fleshy—and a single erect seed. The genus *myrica* has male and female flowers on separate plants; and the scales of the catkin, in both male and female flowers, are concave. The C. has evergreen oblongo-lanceolate leaves with two small serratures on each side at the point, sprinkled with resinous dots. The bark and leaves when bruised emit a delightful fragrance. The drupes—properly called berries—are about the size of peppercorns, and when ripe are covered with a greenish-white wax, which is collected by boiling them and skimming it off, and is afterwards melted and refined. A bushel of berries will yield 4 or 5 pounds. It is used chiefly for candles, which burn slowly, with little smoke, and emit an agreeable balsamic odor, but do not give a strong light. An excellent scented soap is made from it.—*M. gale* is the SWEET GALE of the moors and bogs of Scotland, well known for its delightful fragrance, a native of the whole northern parts of the world. Several species are found at the Cape of Good Hope, one of which, *M. cordifolia*, bears the name of WAX SHRUB, and candles are made from its berries.

CANDLE-FISH, or EULACHON, *Thaleichthys Pacificus*, a remarkable fish of the family *salmonida*, nearly allied to the capelin (q.v.), and, like it, strictly a sea-fish approaching the coasts to spawn, but not entering rivers. The candle-fish inhabits the Pacific ocean, near the western shores of America, from Vancouver's island northwards. It is not larger than a smelt, has a somewhat pointed and conical head, a large mouth, teeth on the pharyngeals, and the tongue rough, but the lower jaw, palatines, and vomer destitute of teeth. The color is greenish olive on the back, passing into silvery white on the sides and belly, sparsely spotted with dirty yellow. It is probably the fattest or most oleaginous of all fishes, or indeed of animals, and is used by the Indians not only as an article of food, but for making oil. To broil or fry it, is nearly impossible, because it almost completely melts into oil. Indeed, the Indians often use it, in a dried state, as a lamp for lighting their lodges, merely drawing through it a piece of rush pith, or a strip from the inner bark of the "cypress tree" of these regions, *thuja gigantea*—a species of arbor vitae—as a wick, a long needle of hard wood being used for this purpose, and the fish being then lighted at one end, burns steadily until it is all consumed. In order to use the dried fish for food, the Indians often melt it into oil, by the application of heat, and drink the oil. It is also eaten uncooked. Drying is accomplished without any gutting or cleaning, the fish being fastened on skewers passed through the eyes, and hung in the thick smoke at the top of sheds in which wood fires are kept burning. They soon acquire a flavor of wood-smoke, and the smoking helps to preserve them. They are then stowed away in large frails, made from cedar-bark or rushes, in order to be used for food in winter. Immense shoals of candle-fish approach the shores in summer, and are caught in moonlight nights, when they come to sport at the surface of the water, which may often be seen glittering with their multitudes. The Indians paddle their canoes noiselessly amongst them, and catch them by means of a monster comb or rake—a piece of pine-wood from 6 to 8 ft. long, made round for about 2 ft. of its length at the place of the hand-gripe, the rest flat, thick at the back, but having a sharp edge in front, where teeth are driven into it about 4 in. long, and an inch apart. These teeth are usually made of bone, but the Indian fishers have learned to prefer sharp iron nails when they can get them. One Indian, sitting in the stern, paddles the canoe; another, standing with his face to the bow, holds the rake firmly in both hands, the teeth pointing sternwards, sweeps it with all his force through the glittering mass, and brings it to the surface teeth upwards, usually with a fish, and sometimes with three or four, impaled on each tooth. This process is carried on with wonderful rapidity. When a sufficient quantity of candle-fish has been dried for winter, the rest that are caught are made into oil, being for this purpose, piled in heaps until partially decomposed, and then placed in large square pine-tree boxes; a layer about 3 deep in the bottom of each box, covered with cold water, and a layer of hot stones put in, then a layer of small pieces of wood, another layer of fish, stones, and so on. The oil is skimmed from the surface of the water in the boxes. A vast quantity of oil is thus obtained. The candle-fish is an excellent article of winter food in a climate of which the winter is severe; and notwithstanding its excessive fatness, is of agreeable flavor. It has not yet become an article of economical value to the civilized inhabitants of North-western America, but seems very likely to do so, and to acquire very considerable commercial importance.

CANDLEMAS, in its ecclesiastical meaning, is the feast of the purification of the Virgin Mary, and is observed on the 2d of February. This festival is very strictly kept by the Roman Catholic church, there being a procession with many lighted candles, and those required for the service of the ensuing year being also on that occasion consecrated; hence the name Candlemas day. In Scotland, this day is one of the four term-days appointed for periodical annual payments of money, interest, taxes, etc., and of entry to premises—the three other term-days there being Whitsunday, Lammas, and Martinmas. See TERM.

An old document of the time of Henry VIII., preserved in the archives of the society of antiquaries, London, concerning the rites and ceremonies in the English church, speaks thus of the custom of carrying candles: "On Candlemas daye it shall be declared that the bearyinge of candles is done in the memorie of Christe, the spirituall lyghte whom Simeon dyd prophceye ['a light to lighten the Gentiles'], as it is redde in the churche that daye." But an older and heathen origin is ascribed to the practice. The Romans were in the habit of burning candles on this day to the goddess Februa, the mother of Mars; and pope Sergius, seeing it would be useless to prohibit a practice of so long standing, turned it to Christian account by enjoining a similar offering of candles to the Virgin. The candles were supposed to have the effect of frightening the devil and all evil spirits away from the persons who carried them, or from the houses in which they were placed. An order of council in 1584 prohibited the ceremony in England. There is a tradition in most parts of Europe to the effect that a fine C. portends a severe winter. In Scotland, the prognostication is expressed in the following distich:

"If Candlemas is fair and clear,
There 'll be twa winters in the year."

Christ's presentation, the holiday of St. Simeon, and, in the n. of England, the wives' feast-day, were names given to Candlemas day. See Brand's *Popular Antiquities*, Bohn's edition.

CANDLE-NUT, *Aleurites triloba*, a tree of the natural order *euphorbiaceæ* (q.v.), a native of the South sea islands, Madagascar, Molucca, Java, etc., which produces a heart-shaped nut with a very hard shell, and a kernel good to eat when roasted, although in a raw state it possesses in a slight degree some of the active properties so common in the *euphorbiaceæ*, and is apt to cause purging and colic. It is about as large as a walnut. An excellent bland oil is procured from it, used both for food and as a lamp-oil. The inhabitants of the Society islands after slightly baking these nuts in an oven, and removing the shell, bore holes through the kernels, and string them on rushes, hanging them up in their houses, to be used for torches, which are made by inclosing four or five strings in a leaf of the screw-pine (*pandanus*). These torches are often used in fishing by night, and burn with much brilliancy. The lamp-black used in tattooing was obtained from the shell of the candle-nut. A gummy substance exudes from the candle-nut tree, which the Tahitians chew.

CANDLESTICK. The ordinary C. is so well known that no description is needed. The most important modern improvement in the C. is a contrivance for maintaining the candle at a uniform height, by means of a spring placed below the candle, and confined in the cylindrical body of the C.; this spring presses the candle upwards with sufficient force to drive it completely out, but for a collar at the top, against which the surface around the wick bears, and thus, as the candle melts, it yields to the pressure of the spring, and maintains a uniform height. The collar, when properly adjusted, also prevents the guttering to which composite candles are liable when exposed to currents of air or moved about.

CANDOLLE, ALPHONSE LOUIS PIERRE PYRAMUS DE, a noted Swiss botanist and son of the naturalist, Auguste de Candolle, born at Paris, October 27th, 1806. He was educated at Geneva where, at his father's desire, he studied law, receiving the degree of LL.D., in 1829, but ultimately abandoned the profession and pursued the study of botany, receiving, two years later, an honorary professorship at the Academy of Geneva, and upon his father's retiring, in 1835, he succeeded him in the professorship and direction of the botanical gardens. After retaining these offices eighteen years, he resigned, in 1851, upon being appointed correspondent of the French Institutes. A year later he was decorated with the Legion of Honor, and in 1874, upon the death of Professor Agassiz, was elected foreign member of the Institute in his place.

The most important of his many writings are the *Introduction à l'Étude de la Botanique* (1834-35, 2 vols.); *Géographie botanique raisonnée* (1855, 2 vols.); *Lois de la nomenclature botanique*; and he also edited a second edition of his father's *Théorie élémentaire de la botanique*, and completed the latter's most important work, *Prodromus Systematis Naturalis Regni Vegetabilis*. He d. in 1893.

CANDY. See CONFECTIONERY.

CANDY. See CEYLON.

CANDYS (Gr.), a loose gown, worn by the Medes and Persians over their other garments. It was made of woolen cloth, which was either purple or of some other brilliant color, and had wide sleeves. In the sculptures at Persepolis, nearly all the personages are represented as so attired. A gown of a very similar kind is still worn by Arabians, Turks, and other orientals.

CANDY-SUGAR is the popular name applied to ordinary sugar when procured in large crystals by the gradual and slow cooling of a concentrated solution of sugar. See SUGAR.

CAN DYTUFT, *Ibérís*, a genus of plants of the natural order *crucifereæ*, distinguished by unequal petals, the largest being towards the circumference of the dense corymbs in which the flowers grow, and by an emarginate pouch with the valves keeled and winged, the cells one-seeded, and the cotyledons accumbent. The species are chiefly found in the countries surrounding the Mediterranean sea, and the name C. is supposed to be derived from that of the island of Candia, the name *Iberis* from Iberia (Spain). One species, *I. amara*, remarkable for its bitterness, is a doubtful native of England. Some species are slightly shrubby, some are herbaceous perennials, some annuals. Some are among the most familiar ornaments of our flower-gardens, as the annual white and purple C. (*I. umbellata*), the sweet-scented C. (*I. odorata*), and two slightly shrubby species, *I. sempervirens* and *I. semperflorens*, the latter of which, in favorable situations, continues to blossom throughout the whole winter, and pleases the eye at all seasons, both by the abundance and the perfect whiteness of its flowers.

CANE, a term sometimes indiscriminately applied to any small and smooth rod, of the thickness of a walking-stick or less; but more correctly limited to the stems of the smaller palms and the larger grasses. We thus speak of sugar C., bamboo C., etc., among the latter; whilst among the former, this name is particularly appropriated to the species of the genus *calamus*, also called rattan. To this genus belong the canes largely imported from the tropical regions of the east for making bottoms of chairs, couches, etc. See RATTAN.

CANE, or **KEN**, a river rising in Bundelcund, near lat. 23° 54' n., and long. 80° 13' e., and, after a n.n.e. course of 230 m., entering the Jumna in lat. 25° 47' n., and long. 80° 35' east. It is too rapid and rugged for navigation; and is remarkable for the matchless beauty of its pebbles.

CANE'A, or **CAN'NA**, called *Khania* by the Greeks, is the chief commercial town of Candia or Crete, and is capital of a province. It is situated on the northern coast, and occupies the site of the ancient Cydonia. The present city is of Venetian origin, and dates from 1252 A.D., when a colony was sent from Venice to occupy it. The object of its foundation was to keep down the Greeks, who had been in arms, and at open war with their Italian lords, almost without intermission from the day when the Venetians first set foot on their shores. Venetian coats of arms are still observed over the doorways of some of the principal houses. C. is surrounded by a strong wall and deep ditch, both of which, however, are in a state of great dilapidation; it has a good but very shallow harbor. C. is the principal mart for Candian commerce, and exports to France and Italy, oil (530 tuns in 1874), soap (50,000 cwts. in 1874), wax, etc. Several consuls are stationed here, and it is the residence of the Turkish governor of the province, and of the Greek bishop. Pop. 12,000, of whom two thirds are native Greeks; the rest mainly Turks. The language spoken is modern Greek. The environs of C. are very beautiful. Sometimes called **Candia** (q. v.).

CANE-BRAKE, *Arundinaria macrosperma*, a large kind of reed or grass, indigenous to the warmer parts of the United States of North America. It grows in marshy situations. It is of a genus allied to the bamboo. The flowers are in panicles.

CANE DELLA SCALA, 1291-1329; known also as **CAN GRANDE**, "great dog," a noted prince of Verona, who took Padua from the Guelphs. In 1318 he was appointed to the chief command of the Ghibelline forces, which brought upon him the pope's excommunication. After several victories, he was seized with illness while making a triumphal entry into Treviso, and died in the cathedral of that city. His court was the most important political and social centre of the time, entertaining Dante, among other men of learning. In the *Paradiso*, Dante eulogizes his patron in glowing terms, and Petrarch also sang his praises.

CANEL'LA, *Canella alba*, a small tree common in the West Indies, where it is often called wild cinnamon. Its place in the botanical system has not yet been exactly ascertained, but it seems to be allied to *pittosporaceae*. The fruit is a small black berry. The whole tree is very aromatic, and its flowers are extremely fragrant. The bark of the young branches is the *C. bark* of apothecaries, also known in commerce as *white-wood bark*, and sometimes called *white cinnamon*. It forms a considerable article of export from the Bahamas. It has an aromatic fragrance, regarded as intermediate between that of cinnamon and that of cloves, and a bitterish, acrid, pungent taste. It is employed as a stomachic and stimulant tonic, and as an aromatic addition to tonics or to purgatives, in debilitated conditions of the digestive organs.

CANEPH'ORI, girls of Athens annually selected from the highest families to walk in the Panathenaic and other processions in festivals, carrying on their heads baskets containing the implements and apparatus necessary for a sacrifice. Their graceful attitudes (which may be seen on the friezes of the Parthenon in the British museum) suggested subjects for sculpture to some of the great artists of Greece. Similar statues are also used in architecture to support light entablatures, and are sometimes identified with caryatides.

CANE SUGAR. See **SUGAR**.

CA'NÉS VENA'TICI (Lat. hunting dogs), a constellation of the northern hemisphere, added by Helvetius, and known generally as the greyhounds of Helvetius. The dogs are distinguished by the names of Asterion and Chara. On the celestial globe, they are represented as being held in leash by Bootes, and apparently pursuing Ursa Major (q. v.) round the pole of the heavens.

CANG, **CANQUE**, or **KEA**, an instrument of degrading punishment in use in China. It consists of a large wooden collar fitting close round the neck, and the weight of which is usually from 50 to 60 pounds. Over the parts where the C. fastens are pasted slips of paper, on which the mandarin places his seal, so that the culprit may not be relieved until the full term of his sentence has expired, which sometimes extends to 15 days. On the C. is also inscribed, in large letters, the offense and the duration of the punishment. The criminal having been paraded through the streets by the police, is then left exposed in some thoroughfare of the city. As he is incapable of using his hands, he has to be fed during the time he is suffering the penalty.

CANGA'-ARGÜEL'LES, José, 1770-1843; a Spanish statesman who was an active opponent of Napoleon, and an energetic member of the cortes of 1812. On the return of the Bourbons he was exiled to the province of Valencia. Under the restoration of 1820, he was made minister of finance, in which position he made many reforms. After the overthrow of the constitution in 1823 he went to England, but returned to Spain in 1829, and was appointed keeper of the archives at Simancas. He wrote *Elements of Finance*; a *Dictionary of Finance*; and *Observations on the Peninsular War*.

CAN'GAS DE O'NIS, a t. of the Asturias, Spain, about 35 m. e.s.e. of Oviedo. It is a poor place, but in its vicinity are one or two interesting monastic structures, and the cave whence the Goths fled and hid themselves, after the battle of Guadalete, in 711, and from which, in 718, they issued, and annihilated the Moorish invaders. Pop. 10,300.

CANGE, DU. See DUCANGE.

CANGIA'GI, OR CAMBIA'SO, LUIGI, 1527-85; a Genoese painter, taught by his father. He gained celebrity at an early age, and, in 1583, was invited to Spain by Philip II. to assist in the decoration of the Escorial, in which he painted the ceiling of the choir, representing the "Assemblage of the Blessed," which is considered his best work. Among others of his works are the "Rape of the Sabine Women," the "Sleeping Cupid," and "Judith."

CANICAT' TI, a t. in Sicily, in the province of Girgenti, and 15 m. e.n.e. of the city of that name. It is situated on the banks of the Naro, is well built, and has sulphur mines. The inhabitants, about 22,000 in number, are principally engaged in agricultural pursuits.

CANICULAR, CANICULAR DAYS, OR DOG-DAYS, CANICULAR YEAR. Canicular was an old name of Canis Minor (q.v.); it was also used to denote Sirius, or the dog-star, the largest and brightest of all the stars, and which is situated in the mouth of Canis Major (q.v.). From the heliacal rising (q.v.) of this star (Sirius), the ancients reckoned their dog-days, or *dies caniculares*, which were 40 in number—20 before, and 20 after the rising of the star. The rising of the dog-star was in ignorance supposed to be the occasion of the extreme heat and the diseases incidental to these days. It was by mere accident that the rising of the star coincided with the hottest season of the year, in the times and countries of the old astronomers. The time of its rising depends on the latitude of the place, and is later and later every year in all latitudes, owing to precession. In time, the star will rise in the dead of winter. The canicular year was that known among the Egyptians and Ethiopians. It was computed from one rising of Sirius to the next, and consisted ordinarily of 365 days, and every fourth year of 366. This year was sometimes called the heliacal year. The reason for computing the year from the rising of Sirius, seems to have been that, at the time, the heliacal rising coincided with the greatest swelling of the Nile. See CALENDAR.

CANIDÆ (Lat. *canis*, a dog), a family of the digitigrade (q.v.) section of carnivorous mammalia, which, as now generally defined, is less extensive than the Linnean genus *canis*, the hyenas being excluded from it, and referred to the family *viverridæ* (civets, ichneumons, etc.). Those families are, indeed, closely connected, and hyenas may be said to form a connecting-link between them, the dentition, however, making a nearer approach than in either of them to that of the cats or *felidæ*.—The C. have two flat tuberculous molar teeth or grinders on each side, behind the great carnivorous cheek-tooth—the last premolar—of the upper jaw, a dentition resembling that of the bear family, or *ursidæ*, to which they exhibit a further resemblance in their power of adapting themselves to the use of vegetable food. Their whole organization fits them to be less exclusively carnivorous than the feline tribe. They have generally three incisors or cutting teeth, with one large canine tooth, and four premolars on each side in each jaw, two true molars on each side in the upper jaw, and three in the lower. The true molars are adapted for crushing either bones or vegetable food. The last premolars in the upper jaw are remarkably large, and particularly adapted for cutting flesh. See Dog, FENNEC, FOX, JACKAL, LYCAON, WOLF, etc.

CANINA, LUIGI, CAVALIERE, 1795-1856; b. in Piedmont; an architect and archaeologist. He was professor of architecture at Turin, and superintended the excavation of Tusculum in 1829, and of the Appian Way in 1848. He wrote many works on architecture and archaeology, some of which were published in the most sumptuous manner by his patroness, the queen of Sardinia.

CANINES, OR CANINE TEETH, the four teeth, two in each jaw, which are pointed and stand between the incisors and the bicuspid; sometimes called "eye teeth" or "stomach teeth." In lions, wolves, dogs, and other carnivora they are large and strong, for holding prey and tearing raw flesh.

CANINI, MARCO ANTONIO, Italian publicist and poet, b. at Venice in 1822, studied at the University of Padua, but became involved in political troubles and fled to Tuscany, where he published *Pius IX. of Italy*. He afterwards took part in the political disturbances of 1849, and left Italy, travelling in Greece and the East. In 1852 he published *Mente, fantasia e cuore*, a volume of poems. After many adventures he returned to Italy in 1859, and in 1862 was appointed political agent in the East by Rattazzi. In 1866 he joined the army of Garibaldi and afterward went to France, but in 1873 returned to Italy. In 1876 he agitated in behalf of the Servians and later took part in the Russian campaign as newspaper correspondent. His works embrace a wide variety of topics and among them may be mentioned *Giorgio il monaco a Leila; Sonetti; Odi saffiche; La questione dell' Epiro; La verità sulla questione degli Israeliti in Rumania; Amore e dolore; Études étymologiques*.

CANISTUS, PETRUS, 1521-97; a Dutch Jesuit, who took a prominent part in the council of Trent in 1545; was preacher to Ferdinand I., and the first ecclesiastical governor of the Jesuits in Germany. He established colleges of the order at Prague, Fribourg, Augsburg, and Dillingen. He was the author of two catechisms, the larger and the smaller, and was beatified in 1864.

CANIS MAJOR, the Greater Dog, a constellation of the southern hemisphere, below the feet of Orion. It contains Sirius, the brightest of all the stars, and its place may

be found by means of this star, which is on the continuation of the line through the belt of Orion. According to Flamsteed, it contains 31 stars.

CANIS MINOR, the *Lesser Dog*, is a constellation of the southern hemisphere. It is near Canis Major, and just below Gemini. Procyon, of the first magnitude, is its principal star, and lies in a direct line between Sirius and Pollux; so that the position of the constellation may be found by means of this star. According to Flamsteed, it contains in all 14 stars.

CANISTER SHOT. See **CASE SHOT.**

CANKER, a disease of plants, especially fatal to fruit-trees in many gardens. It is a kind of gangrene, usually beginning in the young shoots and branches, and gradually proceeding towards the trunk, killing the tree in the course of a few years. Wet sub-soils seem in many cases to induce it, and it begins most readily in shoots that have been imperfectly ripened and injured by frost, or which have received some accidental wound. Those varieties of fruit-trees which have been long propagated by grafting and budding are most liable to it. It is sometimes cured by *heading down* the tree, and causing it to throw out new branches.

CANKER, a vague term applied to various diseases of the lower animals, characterized by their chronic nature, and consisting chiefly in ulceration, suppuration, and the development of fungoid excrescences in the parts affected.

CANKER, in the foot of the horse. This malady, believed by Gerlach, of Berlin, to be truly cancerous, is observed in two different forms: in the acute stage, when the malady is chiefly local; and in the chronic stage, when the constitution suffers, and all local remedies fail to restore a healthy function of the structures of the foot.

Symptoms.—It usually commences by discharge from the heels, or the cleft of the frog of the horse's foot. The horn becomes soft and disintegrated, the vascular structures beneath become inflamed, and the pain which the animal endures is intolerable. It is therefore very lame on one, two, or all feet, according to the number affected. Though there is no constitutional fever, the horse becomes emaciated, and unfit for work. During wet weather, and on damp soil, the symptoms increase in severity. The sore structures bleed on the least touch, and considerable fungoid granulations, commonly called proud flesh, form rapidly.

Causes.—This disease is occasionally hereditary, and it is most frequently seen in low-bred draught or coach horses. Dirt, cold, and wet favor the production of the disease, and there is always a tendency to relapse when once an animal has been affected.

Treatment.—Pare away detached portions of horn, and, in mild cases, sprinkle powdered acetate of copper over the sore; apply over this pledgets of tow, fixed over the foot by strips of iron or wood passed between shoe and foot. In severe cases, tar and nitric acid, creosote and turpentine, chloride of zinc paste, and other active caustics, have to be used for a time with the regular employment of pressure on the diseased surface. The animal requires to be treated constitutionally by periodical purgatives and alteratives. Good food, fresh air, and exercise often aid much in the treatment of the disease.

CANKER-SORE, in the human being, is developed chiefly among children in the form of ulceration of the mucous membrane of the mouth, commonly the result of indigestive derangement. In general it is only a local and temporary affliction, and may be removed by proper application of nitrate of silver, either solid or in a solution, or with borate of soda.

CANKER WORM, *Anisopterys*, a genus of destructive insects of the order *lepidoptera* and family *geometridæ*. The female moths, from the eggs of which this worm comes, are wingless. In the spring they creep up the trunks of trees, on which they deposit their eggs. These soon produce the worms, which feed upon young leaves of fruit-trees and of nearly all cultivated trees. After about four weeks of feeding they creep down, or let themselves down by a web, and burrow in the ground, where they change to chrysalis, and remain until the following spring. Like other *geometridæ*, the worm has six legs forward and four stout pro legs behind. In consequence of their singular mode of locomotion they are often called measuring, or inch or span, or loop worms or geometers. As the female moth cannot fly, trees may be protected from this worm by surrounding their trunks with a hollow vessel filled with oil or thin tar, which prevents the ascent of the egg-laying moth; but in recent years the sparrows introduced from England have entirely subdued this worm in many districts that had been completely denuded of leaves almost every summer. This remedy, however, is worse than the disease. The English sparrow is not, in general, an insect-eating, but is a grain-eating bird; it is very pugnacious, and as prolific as the rabbit; it has driven away the native birds wherever it has gained a footing, and as there are many other insect leaf-eaters which it will not touch, and which no other birds are left to destroy, the trees are in nearly as great danger as before, while the grain-fields of farmers are beginning to suffer severely from the ravages of the sparrows.

CANNA, a plant of the order *marantaceæ*, a species of reed, the fruit of which is a hard black seed growing in a capsule. The starch of C. is sometimes used instead of arrow-root. It grows along the coast in the southern states, and has become a common ornamental plant in the north.

CANNA, one of the islands of the Hebrides, off the w. coast of Scotland, 7 m. s.w. of Skye, and 3 m. n.w. of Rum. It belongs to Argyleshire, and is $4\frac{1}{2}$ m. long from e. to w., and 1 m. broad. The surface stands high above the sea, and consists of trap (clay-stone, porphyry, and trap conglomerate, with fragments of old red sandstone and bituminous wood), which has overflowed thin laminae of coal and shale. The island has a hill of basalt, called Compass Hill, which reverses the magnetic needle. It has a very small population.

CANNABINACEÆ, a natural order of dicotyledonous plants, or, according to many, a suborder of **URTICACEÆ** (q.v.), differing from the proper *urticaceæ* chiefly in the suspended exalbuminous seed, and hooked or spiral embryo. But only two plants of the order or suborder are known, both of them valuable, **HEMP** (q.v.) and the **HOP** (q.v.).

CANNABIS INDICA. See **HEMP**.

CANNÉ (ancient *Cannæ*), a t. of Southern Italy, in the province of Bari, 8 m. w.s.w. of Barletta, not far from the mouth of the Ofanto, formerly the Aufidus. It is celebrated on account of the great victory here gained by Hannibal over the Romans in the summer of 216 B.C. Hannibal crossed the Aufidus at a ford, and attacked the Romans, who in a short time were almost annihilated by the terrible Numidian cavalry. Among those left on the field were Paulus Æmilius, the consul of the previous year; Minucius, the late master of the horse; and a vast number of Roman knights. The loss of the Romans is stated by Livy at 45,000 infantry and 3,000 cavalry. As Hannibal lost in the battle 8,000 men, he did not think it prudent to follow the advice of Maharbal, and advance rapidly on Rome. Twenty thousand Romans were made prisoners, partly on the field of battle and partly in the camp.

CANNEL COAL. See **COAL**.

CANNES, a seaport t. of France, in the department of Alpes-Maritimes, pleasantly situated on the Mediterranean, on the road to Nice. The district in which it is situated is picturesque and very fertile. Oranges, lemons, olives, almonds, figs, peaches, and grapes are extensively cultivated. Situated on an elevation that slopes toward the sea, it is sheltered from the northern winds by a range of hills. It is famed for its salubrity, which has induced a number of English families to make it a winter residence; and it has become one of the most fashionable resorts in France. Lord Brougham used to occupy a fine villa here, and his death occurred here in 1868. Latterly, the town has been much improved. It has fisheries of anchovies and sardines, and a trade in the produce of the district. After his escape from Elba, Bonaparte landed about a mile and a half to the e. of C., Mar. 1, 1815. Pop. '91, 19,983.

CANNIBAL (derived from a variety in the spelling of Caribs, the original inhabitants of the West India islands, who were reputed to be man-eaters, and some tribes of whom, having no *r* in their language, pronounced their name *Canib*), means, like the Greek word *anthropophagos*, which is often used instead of it, one who feeds on human flesh. The practice is often attributed by classical and early Christian writers to races whose practices they denounce as abominable; but the denunciation is often better evidence of the abhorrence of cannibalism by those making the accusation than of its practice by the accused. Homer makes Polyphemus eat men, but only as one of his other unnatural attributes as a monster. The early Christian writers frequently attributed cannibalism to the unconverted. St. Jerome gives his personal testimony to the practice, stating that when he was a little boy living in Gaul he beheld the Scots—a people of Britain—eating human flesh; and though there were plenty of cattle and sheep at their disposal, yet would they prefer a ham of the herdsman or a piece of female breast as a luxury. Statements in old authors still more absurd induced some thinkers to believe that cannibalism is unnatural, and to deny that it was ever practiced by human beings except under the pressure of starvation. The accurate observation of late travelers has, however, put it beyond doubt that cannibalism has been and is systematically practiced. Comte, as part of his system of positive philosophy, accepting of cannibalism as a condition of barbarism, maintains that the greatest step in human civilization was the invention of slavery, since it put an end to the victor eating the vanquished. The facts, however, which we possess, show that the people systematically addicted to human flesh are not the most degraded of the human race. For instance, in the Australian continent, where the larger animals are scarce, the people, who are of an extremely degraded type, feed on worms and herbs, and have only been known in casual and exceptional conditions to feed on human flesh. The New Zealanders, on the other hand, who are the most highly developed aboriginal race with which late European civilization has had to compete, were, down to a late period, systematic feeders on human flesh, despising the inefficient food which satisfied the natives of Australia. In Angus's *New Zealand Illustrated*, there is a picture of the country mansion of the accomplished chief Rangihæta, "one of the finest specimens," says the author, "of elaborately ornamented dwellings yet extant." Its name is Kai Tangata, which means, eat man; and it has been so called in pleasing memorial of the feasts held within its walls. It has been supposed that the reason why, among the Jews and several eastern nations, the eating of swine's flesh was forbidden as an unclean food, was its resemblance to human flesh, and the danger that persons accustomed to the one might not retain their abhorrence of the other. In the crusades, the Saracens charged their Christian enemies with eating unclean food, including flesh

of men and of swine. In the old romance of Richard Cœur de Lion, he is represented, on recovering from sickness, as longing for a piece of pork; but that not being procurable, a piece of a Saracen's head was substituted for it, and pronounced by him to be infinitely more palatable. There have been many sad instances where people who naturally had a horror of such food, have been driven by starvation to eat human flesh—as in sieges and shipwrecks. Besides these instances, however, and the systematic cannibals, there is no doubt that people not otherwise habituated to the practice, have been excited by ferocity and revenge to eat, and with relish, the flesh of enemies. In many of the cannibal countries, only the flesh of enemies is consumed. As an instance that this is a natural development of ferocity in degraded natures, we may take the fate of the princess Lamballe in the French revolution, whose heart was plucked out by one of the savages of the mob, taken to a restaurant, and there cooked and eaten by him. The great Highland chief, sir Ewen Cameron of Lochell, in a death-struggle with an English trooper, killed him by biting a piece out of his throat, and used to say it was the sweetest morsel he had ever tasted. See Andrée, *Die Anthropophagie* (Leip., 1887).

CANNING, CHARLES JOHN, Viscount, second son of the statesman George, was b. Dec., 1812. Educated at Eton and Oxford, he succeeded to the peerage as viscount C. on his mother's death in 1837, his elder brother, who was a captain in the navy, having been drowned at Madeira in 1838. In 1841, he became under-secretary of state for foreign affairs in sir Robert Peel's government, and afterwards commissioner of woods and forests. When lord Aberdeen came into office, he was made postmaster-general; and in the beginning of 1856, he succeeded lord Dalhousie as governor-general of India. His conduct during the awful crisis of the Indian mutiny was decried at the time by many as weak and pusillanimous; but the general opinion now, when all the circumstances of the case are better known, is that he acted with singular courage, moderation, and judiciousness. He died in London, 17th June, 1862.

CANNING, GEORGE, a distinguished British statesman and orator, was b. in London, April 11, 1770. His father, who was descended from an ancient family, incurred the displeasure of his relatives for marrying beneath his station, and died in poverty when his son was only a year old. His mother (who for a subsistence tried the stage, with but little success, married an actor, and subsequently a linen-draper) lived to rejoice in the success and participate in the good-fortune of her boy, whose education was liberally provided by an uncle. C. was first educated at Eton, from which he passed, at the age of 17, to Christ's church college, Oxford, where he greatly distinguished himself, especially in classics. While here, he cultivated the friendship of the Hon. Charles Jenkinson (afterwards lord Liverpool), who was of considerable service to him in after-life. From Oxford he went to Lincoln's inn, but on the suggestion of Burke, as it is said, he soon relinquished the bar for a parliamentary career. He entered the house for Newport, Isle of Wight, in 1793, as the protégé and supporter of the minister, Pitt. In 1796, he was appointed an under-secretary of state. It was not, however, until 1798 that C. made a reputation as an orator and a statesman, by his speeches in favor of the abolition of the slave-trade, and against Mr. Tierney's motion regarding peace with the French directory, the latter of which, especially, was regarded as a masterpiece of eloquence, alike by the house and the country. In the debates on the habeas corpus suspension act, the union with Ireland, and other important questions, C. gave valuable assistance to the ministry, not only by his voice in parliament, but by his pen in a satirical paper, called the *Anti-Jacobin*, in which he especially lashed the "new philosophy," as it was called, promulgated by the French republicans. *The Knife Grinder* is one of the best known and happiest of his efforts in this line. In 1801, Pitt resigned office, and C. joined the opposition against the Addington ministry. When Pitt again became premier in 1804, C. was made treasurer of the navy, an office which he held until Pitt's death in 1806. His opposition to the short-lived Grenville ministry which succeeded, savored of the bitterness of party feeling, and his treatment of Fox in his last days, and of his memory after his death, was far from generous. When the Portland ministry was formed in 1807, C. was appointed minister for foreign affairs, a position for which he was specially qualified, and his dispatches, written at this time, are models of manliness and lucidity. In 1812, all his eloquence was enlisted in favor of Catholic emancipation. During the same year he was elected for Liverpool, for which he was again returned three successive times. In 1814, he went as ambassador to Lisbon, returned in 1816, and was made president of the board of control, and supported the Liverpool ministry in all their arbitrary and repressive measures until 1820, when he resigned, in consequence of the action of the government against queen Caroline. Nominated governor-general of India in 1822, he was on the eve of departure when the suicide of the marquis of Londonderry called him to the head of foreign affairs. In this capacity, C. conferred lasting benefits on his country. He infused a more liberal spirit into the cabinet, he asserted the independence of British politics against the diplomacy that would have entangled the nation with the Holy Alliance, and gave a new direction and impetus to commercial affairs by a gradual laying aside of the prohibitive system. He arranged the relations of Brazil and Portugal; drew the French cabinet into agreement with the British respecting Spanish American affairs; was the first to recognize the free states of Spanish America; promoted the treaty combining England, France, and Russia, for a settlement of the affairs of Greece,

and which was signed July 6, 1827; protected Portugal from Spanish invasion; contented earnestly for Catholic emancipation; and prepared the way for a repeal of the corn-laws. In Feb., 1827, a stroke of paralysis forced the earl of Liverpool to resign, and Mr. C. was called upon to form a new administration. His health, however, gave way, and he died Aug. 8. See Lord Dalling's *Historical Characters* (1867).

CANNING, SIR STRATFORD. See STRATFORD DE REDCLIFFE, Viscount.

CANNON. See MACHINE GUNS, ORDNANCE, ORDNANCE FABRICATION, RAPID-FIRE GUNS.

CANNON, a co. in central Tennessee; 280 sq. m.; pop. '90, 12,197, includ. colored. The surface is uneven, but the soil is generally fertile, producing grain, tobacco, etc. Co. seat, Woodbury.

CANNON, GEORGE Q., b. Liverpool, Eng., in 1827; received a thorough education; one of the first settlers in the Great Salt Lake basin, now Utah territory; member of the legislative council of Utah, 1865, '66, '69, '70, '71, '72; delegate in congress from Utah for many years; influential Mormon leader; translated the *Book of Mormon* into the Hawaiian language.

CANNON, JOSEPH G., b. N. Car., 1836; was state's atty. in Ill., 1861-68; was elected to congress as a Republican from Illinois in 1872; and re-elected for each succeeding term.

CANNON FOUNDING. See ORDNANCE FABRICATION.

CANNSTATT, a t. of Württemberg, beautifully situated on the Neckar, about 3 m. n.e. of Stuttgart. It owes its origin to the Romans, of whose presence there are still found many traces. It has numerous mineral springs. Pop. '90, 19,800.

CA'NO, ALONSO, an illustrious Spanish painter, the founder of the school of Granada, in which city he was born, Mar., 1601. He received his first instructions in the principles of art from his father, Miguel Cano, who was an architect; studied sculpture under J. Montanes, and painting under Pacheco and Juan de Castillo; and attained celebrity so early that, in 1638 or 1639, he was appointed court painter and architect to the king. He died at Granada in 1664 or 1667.

CANOE AND CANOEING. A canoe is a species of boat, made by hollowing and shaping the trunk of a tree; sometimes of skins stretched over whalebone, as used by the Esquimaux, and propelled by the double-bladed paddle, 7 feet long and 6 inches broad. Also from the bark of trees shaped and strengthened. The French for canoe we find to be *cannot*, Spanish *canoa*, Italian *canoe*, all derived from the Latin *canna*. Often, however, the inhabitants of France give the following names to the canoe, *bateau*, *caïque*, *bôt*, *navire*, *pirogue*, *chaloupe*, *nacelle* or *périssoir*; to the paddle, *pagaye*, and the paddler *pagayeur*. The English word "canoe" may be defined as a boat propelled by one or more paddles, used without a fixed fulcrum (prop or support) on the boat, and, therefore, invariably with the sitter facing toward the bow. Canoes are made of many different substances. In America, the most commonly used one is the birch-bark canoe, which is made in all sizes. Paper canoes are also in use, but are too light and cranky except for racing. Canoes of tin and of india-rubber have been used in England; but for general use canoes made from oak, cedar, birch, or pitch pine are the most durable. In having a canoe built, it is a matter of considerable moment that in certain portions of its framework it should be constructed for, and peculiarly adapted to, the particular person who is to use it. The length of the foot decides the height the canoe should be from keel to deck; the length of the legs the space required for the "well;" while the weight, of course, decides the displacement. The canoe has been popular in England for more than twenty years, merely, however, for short races on smooth waters. It was not until 1865 that one was especially designed for a long journey by water in seas, lakes, and rivers, and by railroads and carriages on land, and to be dragged over rough roads and through thick woods, or carried on men's shoulders from one stream to another, as is so frequently the case to-day, especially in America. Oak is the best wood that can be used, with the top streak of mahogany and the deck of fine cedar. Of these materials, the *Rob Roy* (Mr. Macgregor's famous boat) was made, and as her weight with all her fittings was only 71 lbs., it would be unreasonable to expect one lighter; indeed, for any one knocking about, lighter or flimsy canoes are utterly useless, and only increase the labor of paddling. The length over all should be 14 feet; beam, 26 inches; depth, from top of deck to bottom of keel, 12 inches, though towards the gunwale this is reduced to 8½ inches. The well should be 32 inches long and 20 broad, and protected by a combing of oak half an inch in length. If the canoe be intended for travelling purposes, the beam should be 6 inches abaft midship, so that when stores, provisions, sails, and so on, are stowed away forward it brings the craft to very nearly an even keel. The paddle is 7 feet long with 6 inches of breadth in the blade, and can be either double-bladed or single. Some canoes are arranged with rudders which are worked with the feet, in order to counterbalance the lateral swerving, but in this country these are very little used. The boards that compose the floor are about two feet long, and are fitted so that the knees just touch the combing while the heels are against the footboard on the keel, thus obviating the discomfort which would follow if one were obliged to keep the legs stretched out at full length. Sails are frequently used. The weight of an ordinary travelling canoe when complete is about 70 lbs. It will float, with its paddle and 10 lbs. of lug-

gage, in 5 inches of water. For racing over a short, straight, smooth course, the ordinary sculling skiff will be found superior to the canoe, but for long journeys or in strange rivers, or following unknown streams in rocky countries, or for rough usage, intricate navigation, frequent portage, or unexpected difficulties, the canoe is far superior and much more useful than the ordinary rowing boat. An average of forty miles a day can be made on lakes in a travelling canoe, unless contrary winds interfere. Canoes for fast racing are 20 feet long and 18 inches broad, and can attain a speed of about 8 miles an hour. The best material for a paddle is spruce-fir, as it combines lightness and durability. In 1866 the Royal Canoe Club was formed in England, with the Prince of Wales as Commodore, while about 500 members from various parts of the world have been elected. At the present writing (1891) the American Canoe Club numbers fully 5000 members. Many rivers have been explored in all parts of the world in canoes; some of the most important and interesting are the Kishon, the Jordan, the waters of Merom, in Syria, as well as the Lake Menzaleh, in the Delta of the Nile. Many rough and dangerous passages have been made in canoes; one member of the Royal Canoe Club crossed the English Channel from Dover to Boulogne, another from Boulogne to Dover, and a third the Irish Channel from Scotland to Ireland. There is, of course, danger in canoeing, and every one who decides to make canoeing a pastime should first learn how to swim. The sport is a most healthful one, and during the past few years has become very popular in America, where it can be enjoyed from May to September in the Eastern States and Canada, and nearly all the year round in the South. See *Canoe Travelling*, by W. Baden Powell; *Cruise in a Cockle Shell*, by A. H. Reed; *The Canoeist* (Royal Canoe Club); *A Thousand Miles in the Rob Roy Canoe*, *The Rob Roy on the Baltic*, and *The Rob Roy on the Jordan, Red Sea, Nile, and Gennesareth*, by Macgregor; *Watery Wanderings*, by Holding (1886). The *American Canoeist* represents the American Canoe Association. See CATAMARAN.

CANON, a word originally Greek, and signifying a measuring-rod (see CANOE—*ad init.*), applied in various arts and sciences to what serves for a rule or standard, but particularly employed to designate collectively those books which constitute the Holy Scripture, and are accepted by Christians as a rule of faith. See BIBLE. In ecclesiastical language, the word *canon* signifies, besides, not only a church-precept, but also the decree of a universal council, which is held valid as law. See CANON LAW.

CANON, an ecclesiastical dignity, so called as living under a rule, or as following the rule or canon of divine service. His office is of no great antiquity. According to Paschier, the name was not known before Charlemagne. This, however, is not precisely true, for the term C. was applied in the 4th c. to cenobites living under a common rule; but the office of C. is supposed to have been first instituted by Chrodegand or Chrodegang, bishop of Metz, in 763. It is at least certain that he was the author of the oldest canonical rule, which was simply an adaptation of the monastic rule (commonly but erroneously attributed to St. Augustine) to the priests and "clerks" specially attached to the service of a cathedral or other church. It enjoined on the canons manual labor, the practice of silence at certain times, confession twice a year, and other duties needless to specify. The canons formed the council of the bishop, and assisted him in the government of his diocese. They lived in a house called a *monastery*, slept in a common room, ate at the same table, and were originally supported out of the episcopal revenues. In 816, Louis le Débonnaire induced the council of Aix-la-Chapelle to draw up a general rule for the whole body of canons. Canons found their way not long afterwards into England, Scotland, and Ireland. Various reforms of C. were made in the 11th and beginning of the 12th century. Gradually, however, many began to emancipate themselves from the restrictions of monastic life, and to live independent of any rule, which is not at all surprising, for the canons were wont to keep apart from the "lower clergy," as they called parish priests and others who really labored to impart religious instruction. They were often of noble families, loved titles—at Lyon, they were called *counts*—and in general were men of the world rather than true churchmen. Some of these reformed or remodeled canons were called black canons, from wearing a black cassock; white canons, from wearing a white habit like the *Præmonstratenses* of Picardy in France. The class of *secular* canons, whose manner of life was not conventual, and who therefore escaped destruction in England when the monasteries were abolished by Henry VIII., probably originated in a tendency to relax the severity of rule enjoined on the regulars, which indeed was hardly less stringent than in the case of ordinary monks. Secular canons still exist in the Anglican church, and their duties—making allowance for the difference between the Roman Catholic and Protestant religions—are much the same in kind as they were before the reformation. See CATHEDRAL.

CANON, in music, a kind of fugue in which not merely a certain period or phrase is to be imitated or answered, but the whole of the first part with which the C. begins is imitated throughout by all the other parts. As in fugues, the melody of the part to be imitated is called the subject, and the others its reply. The C. is the highest degree of mechanical musical contrivance. The ancients spent more time in the construction and resolving of mere puzzling and unentertaining canons, than in the cultivation of good harmony and melody.

CANON (Sp. a "tube"), used in the western states and territories to designate a deep ravine, especially if worn down by running streams. Of late the word is often

spelled *canyon*. There are many cañons in the Rocky mountain region and further westward; but the greatest is the Grand Cañon of the Colorado, which is more than 300 m. long, with nearly perpendicular walls from 3,000 to 7,000 ft. high.

CANON CITY, city and co. seat of Fremont co., Col.; on the Arkansas river at the foot of the Rocky mountains, and on the Denver and Rio Grande railroad; 41 miles w. of Pueblo. There is unlimited water-power, and in the neighborhood are iron, silver, copper, coal, petroleum, marble, and limestone. There are also hot and cold medicinal springs. It has a public library, and is the seat of the State penitentiary. Pop. '90, 2825.

CANONESS, the name given to female members of certain orders in the Roman Catholic church, who seldom took monastic vows, but lived in common. The communities were favored by noblemen, who intrusted their daughters to them, but with the privilege to marry at any time.

CANONICAL HOURS, are the times fixed for divine service in the Catholic church, but no longer strictly adhered to. These have not always been the same, and it is not known when nor by whom they were settled—some say by popes Damasus, or Gelasius, or Gregory—but they are now fixed at seven; viz., matins and lauds, prime, tierce, sext, none, vespers, and compline. These used to be observed as follows: Prime, tierce, sext, and none, at the first, third, sixth, and ninth hours of the day, counting from six in the morning; vespers at the eleventh hour; compline, or completorium, as completing the services of the day, at midnight; and matins shortly after midnight. These hours were by the Anglo-Saxons called *uhtsang*, *primesang*, *undersang*, *middaysang*, *noonsang*, *evensang*, and *nightsang*. The first, two and the last formed the nocturnal, the remaining four the diurnal offices. The reasons given for the dividing the day into seven parts were—that in seven days the creation was completed, that seven times a day the just man falls, there are seven graces of the Holy Spirit, seven divisions of the Lord's prayer, seven ages of a man's life, etc. The hours had also each its mystical reference to certain sacred occurrences, such as the incidents at our Lord's birth and crucifixion. The word "hour," in C. H., is derived, as some have suggested, from *ora*, a prayer; but more probably from *hora*, an hour, and called canonical because according to the canon or rule of the church. The proper offices for the C. H. are to be found in the Breviary (q.v.).

CANONICALS, a term used to describe the proper ecclesiastical dress of the clergy. See VESTMENTS.

CANONICAL VIRGINS, young women of the early church who took vows of perpetual virginity, but were not gathered into communities. They were enrolled at their homes, where they continued to reside.

CANON'ICUS, a Narragansett Indian chief, 1565-1647; the constant friend of the early white colonists, and especially of Roger Williams, to whom he was strongly attached. It was from him that Williams obtained his title to the lands that now constitute Rhode Island.

CANON'ICUT, or CONANICUT, an island in Narragansett bay, about 8 m. long by 1 wide. It forms the town of Jamestown, R. I.; pop. '90, 707.

CANONIZATION, in the church of Rome, the act of the pope by which a deceased person is solemnly declared to be a saint. It had its origin in the practice of the early church, of inserting in the commemorative prayer of the eucharistic liturgy the roll of the names of those who had died as martyrs, or distinguished themselves as confessors of the faith. This record was entered in the diptychs of the church, and read in the so-called "canon" of the liturgy. Each bishop was at first accustomed to declare deceased persons to be saints. In the west, the exercise of this power came to be reserved to the popes, and the ceremonial itself was invested with much solemnity, and regarded as of very great importance. The first papal C. was accomplished by John XV. The popes have possessed the exclusive right since 1170. The right of *beatification* (q.v.) also belongs to them. When it is proposed to canonize a person of reputed sanctity, the pope declares his views in a consistory, and an inquiry is instituted as to the virtues and merits of the person proposed. The form of inquiry is that of a regular process at law, and an ecclesiastic is specially appointed to contend against the claims advanced, who receives the designation of *advocatus diaboli*; and on failure of satisfactory proof, the process is abandoned. When a favorable decision is pronounced, the ceremony of C. is performed in St. Peter's church with great pomp. The last C. was in 1862.

The Greek church also recognizes *canonization*. The right to perform the ceremony lies with the patriarch of Constantinople, but it has rarely occurred. An analogy to Christian canonization has been found in the apotheosis (q.v.) of the ancient Romans.

CANON LAW is a collection of ecclesiastical constitutions for the government and regulation of the Roman Catholic church, although many of its regulations have been admitted into the ecclesiastical system of the church of England, and still influence other Protestant bodies. It was compiled from the opinions of the ancient Latin fathers, the decrees of general councils, and the decretal epistles and bulls of the holy see. These, from a state of disorder and confusion, were gradually reduced into method, and may be briefly described in the following chronological order: 1. *Gratian's Decree*,

which was a collection of ordinances, in three books, commenced by Ivo, bishop of Chartres, 1114 A.D., and subsequently corrected and arranged by Gratian, a Benedictine monk, in the year 1150, after the manner of Justinian's *Pandects of the Roman Law*. This work comprises ecclesiastical legislation, as it may be called, from the time of Constantine the great, at the beginning of the 4th, to that of pope Alexander III., at the end of the 12th century. 2. The *Decretals*. They are a collection of canonical epistles, in five books, written by popes alone, or assisted by some cardinals, to determine any controversy, and first published about the year 1230, by Raimundus Barcinus. They lay down rules respecting the lives and conversation of the clergy, matrimony and divorces, inquisition of criminal matters, purgation, penance, excommunication, and other matters deemed to be within the cognizance of the ecclesiastical courts. To these five books of Gregory, Boniface VIII. added a sixth, published 1298 A.D., called *Sextus Decretalium*, or the *Sext*, which is itself divided into five books, and forms a supplement to the work of Barcinus, of which it follows the arrangement. The *Sext* consists of decisions promulgated after the pontificate of Gregory IX. Then there came the *Clementines*, which were constitutions of pope Clement V., published 1308 A.D. These decretals form the principal portion of the canon law. John Andreas, a celebrated canonist in the 14th c., wrote a commentary on them, which he entitled *Novelle*, from a very beautiful daughter he had of that name, whom he bred a scholar; the father being a professor of law at Bologna, had instructed his daughter so well in it, that she assisted him in reading lectures to his scholars, and therefore, to perpetuate her memory, he gave that book the title of *Novelle*. 3. The *Extravagants* of John XXII. and other later popes, by which term is meant to be denoted documents which transcend the limits of a particular collection of regulations. These books, viz., *Gratian's Decree*, the *Decretals*, and the *Extravagants*, together form the *Corpus Juris Canonici*, or great body of the C. L., as formerly received and administered by the church of Rome. There are, however, other publications of a later period, of more or less authority, but which do not appear to have received the formal sanction of the holy see.

This C. L., borrowing from the Roman civil law many of its principles and rules of proceeding, has at different times undergone careful revision and the most learned and scientific treatment at the hands of its professors, and was very generally received in those Christian states which acknowledge the supremacy of the pope; and it still gives ecclesiastical law more or less to Roman Catholic Christendom, although its provisions have in many countries been considerably modified by the *concordats* (q.v.) which the popes now and then find it expedient to enter into with Roman Catholic sovereigns and governments, whose municipal system does not admit of the application of the C. L. in its integrity. Indeed, the fact of its main object being to establish the supremacy of the ecclesiastical authority over the temporal power, is sufficient to explain why, in modern times, it is found to conflict with the views of public law and government, even in the case of the most absolute and despotic governments.

This ecclesiastical system, however, never obtained a firm footing in England, and the great lawyers and statesmen have always shown not only an unwillingness to defer to its authority, but even an aversion to its rule. There was, however, a kind of national C. L. in England, composed of *legative* and *provincial* constitutions, adapted to the particular necessities of the English church. The legative constitutions were ecclesiastical laws, enacted in national synods, held under the cardinals Otho and Othobon, legates from pope Gregory IX. and pope Clement IV., in the reign of king Henry III., about the years 1220 and 1268. The *provincial* constitutions are principally the decrees of provincial synods, held under divers archbishops of Canterbury, from Stephen Langton, in the reign of Henry III., to Henry Chicheley, in the reign of Henry V., and adopted also by the province of York in the reign of Henry VI. At the dawn of the reformation, in the reign of Henry VIII., it was enacted in parliament that a review should be had of the C. L.; and till such review should be made, all canons, constitutions, ordinances, and synodals provincial being then already made, and not repugnant to the law of the land or the king's prerogative, should still be used and executed. And as no such review has yet been perfected, upon this enactment now depends the authority of the C. L. in England, the limitations of which appear, upon the whole, to be as follows: that no canon contrary to the common or statute law, or the prerogative royal, is of any validity; that, subject to this condition, the canons made anterior to the parliamentary provision above mentioned, and adopted in our system (for there are some which have had no reception among us), are binding both on clergy and laity; but that canons made since that period, and having no sanction from the parliament, are, as regards the laity at least, of no force. See CANONS OF THE CHURCH OF ENGLAND.

In Scotland, Presbyterian though the ecclesiastical system of that country be, the old Roman C. L. still prevails to a certain extent. "So deep hath this canon law been rooted," observes lord Stair in his *Institutes of the Scotch Law*, "that even where the pope's authority is rejected, yet consideration must be had to these laws, not only as those by which church benefices have been erected and ordered, but as likewise containing many equitable and profitable laws, which, because of their weighty matter, and their being once received, may more fitly be retained than rejected." In two old Scotch acts of parliament, made in 1540 and 1551, the C. L. is used in conjunction with the Roman law to denote the common law of the country, the expression used being "the

common law, baith canon, civil, and statutes of the realme." See on the subject of this article generally the following authorities: Blackstone's *Commentaries*, by Kerr, vol. i., pp. 65 and 66; Stephen's *Commentaries*, 4th edition, vol. i. pp. 61 and 69—vol. ii. pp. 251, 256, 257, and 290—vol. iii. pp. 45, 48, and 421—and vol. iv. p. 242; Dr. Irving's *Study of the Civil Law*; and Phillimore on the *Influence of the Ecclesiastical Law, etc.*, 1851. See also a discriminating article on this subject in Knight's *Political Dictionary*, 1845; and see Wharton's *Law Dictionary*, 2d edition, 1859. It will also be found carefully treated in Dr. Hook's *Church Dictionary*, 7th edition, 1854.

CANONS, BOOK OF, in Scottish ecclesiastical history, a code of canons or rules for the church of Scotland, prepared by the Scottish bishops, in obedience to the command of Charles I., revised by Laud, and confirmed by letters-patent under the great seal, 23d May, 1635. It tended much to increase the dissatisfaction prevalent throughout Scotland, and which soon broke out so violently. It not only required the most strict adherence to the liturgy, then not yet published, but enjoined many things concerning ceremonies in worship beyond what Laud had been able to introduce in the church of England; it also took away the powers of church-courts, and decreed the penalty of excommunication against all who should deny the government of the church by bishops to be scriptural, whilst its very first canon decreed that penalty against all who should deny the king's supremacy in ecclesiastical affairs.

CANONSBURG, a borough in Washington co., Penn.: on Chartier creek and the Pittsburgh, Cincinnati, Chicago, and St. Louis railroad; 22 m. s.w. of Pittsburgh; formerly the seat of Jefferson College and of the Pennsylvania reform school. It is in an oil, coal, and natural gas region, and contains iron and steel foundries, planing mills, Jefferson Academy, public library, national bank, and several newspapers. Pop. '90, 2113.

CANONS OF THE CHURCH OF ENGLAND, called constitutions and canons ecclesiastical, agreed upon, with the king's license, in the synod held at London in 1603-04. They were drawn up by the convocation, in order to give effect to the decisions of the conference held at Hampton; and are, for the most part, a digest of old canons, with some new ones added. They are 141 in number. They are the basis of the ecclesiastical law, as far as the clergy are concerned, but they are not binding upon the laity, except in so far as they are declaratory of the ancient canon law. There had been a previous body of canons drawn up in 1571, but these had not been sanctioned by the sovereign. In 1640, the convocation, which was then assembled with the parliament, prolonged its session beyond it, and passed a body of canons of a very arbitrary character; amongst other things, enjoining that on some Sunday in every quarter, every officiating minister should insist on the divine right of kings and their prerogatives, and enforce conformity to the rites of the church of England. In these canons, it was directed that the communion-table should be railed in, and be placed as in cathedrals, as is now done in all churches. These canons were abrogated by an act passed in the 13th year of Charles II. An account of these canons and those now in force may be found at length in Hook's *Church Directory*.—Every clergyman, when instituted to a benefice or licensed to a cure, promises CANONICAL OBEDIENCE to the bishop—i.e., the obedience due according to the canons of the church.

CANOPIC VASES were vases used by the Egyptian priests to contain the viscera of embalmed bodies. They were arranged in a series of four—the first contained the stomach and larger intestines; the second, the smaller intestines; the third, the lungs and heart; the fourth, the liver and gall-bladder; and each had on its lid the head of the particular deity who was supposed to preside over the contents.

CANOPUS or **CANO'BUS**, a city of ancient Egypt, from which the Canopic mouth of the Nile derived its name, was situated on the sea-coast, 15 m. e. of Alexandria. The Canopic mouth of the Nile appears to have been at an early period the only one into which foreign ships could enter. At C. the boundry-line between Asia and Africa was drawn by the ancient geographers. There was a temple of Hercules here, which was a secure sanctuary to all who fled to it; also one of Serapis, as several extant Greek inscriptions show. The inhabitants of C., a mixed Egypto-Hellenic people, were infamous, in the Greek and Roman times, for their profligacy. The city declined after the rise of Alexandria. Traces of its ruins are visible about 3 m. from Aboukir.

CANOPUS is also the name of a very brilliant star of the southern hemisphere, in the constellation of the ship Argo, and, as Plutarch relates, received its name from Canopus, the pilot of Menelaus.

CANOPY (Lat. *canopeum*; Gr. *kônôpeion*, from *kônôps*, gnat or mosquito). The derivation of this word throws a curious light on its original meaning, which probably was a mosquito curtain. The simplest form of C., in this its primitive sense, is that mentioned by Herodotus (ii. 95), who tells us that the fishermen on the Nile were in the habit of suspending the net with which they had fished during the day on an upright pole, from which it was expanded into the form of a tent, and served to protect them from the attacks of insects during the night. As it has been proved that insects will not pass through the meshes of a net, though wide enough to admit them, it is probable that this simple contrivance may have been quite effectual for the purpose for which it was used. Horace (Epod. ix. 9), and others of the ancient writers, mention gnat-curtains (*canopea*). Subsequently, the same term came to be used for the projecting covering and hangings of a bed, without reference to their original use, and latterly for any

projecting covering of a similar form, to whatever use it might be adapted, or whatever materials it might be formed. C. is thus used to signify the covering which is borne over the heads of kings and other persons of distinction, and still more frequently over the holy sacrament and the image of Christ, in processions in Roman Catholic countries. See BALDACHIN.

In Gothic architecture, C. is the term applied to those rich coverings which are frequently met with over niches and tombs, and sometimes over doors and windows. It belongs chiefly to the decorated and perpendicular styles, though it was not unknown much earlier. The C. consists of a roof, which may be supported on pillars all round, or may have one, or if in an angle *two*, sides attached to the wall, with dependent ornamental work representing drapery. The early English canopies are usually simple in form; those in French buildings of the same period being greatly more complicated and elaborate, as, for example, those in the cathedrals of Chartres and Bayeux. In the decorated style, the canopies were richly ornamented and very various in form. Some canopies are ornamented by pinnacles supporting smaller canopies, the whole terminating in a structure resembling a small turret, or crocketed spire. In the perpendicular style, though more varied in form, the canopies resemble those in the decorated. Most of the cathedrals and larger churches of England furnish examples of canopies, many of which are enumerated in Parker's *Glossary of Architecture*. For the use of canopies in Italian architecture, see BALDACHIN.

CANOSA, a t. of southern Italy, in the province of Bari, 13 m. s.w. of Barletta. It is situated on the declivity of a steep hill, upon the summit of which there are the remains of an old castle. It has a cathedral; and in an adjoining court is a tomb to Bohemond, prince of Antioch. It is chiefly remarkable, however, in connection with the discovered antiquities of ancient *Canusium* (one of the chief cities of the Apulians, the origin of which is obscured in the mists of mythology), on the site of whose citadel the modern town is said to stand. The antiquities consist of subterranean sepulchers, containing painted vases and funereal furniture of the most magnificent description in perfect order, painted busts, marble statues, etc. The objects were transferred to the museum at Naples. Pop. 16,000.

CANOS/SA, a t. of northern Italy, in the province of Reggio, about 12 m. s.w. of the city of Reggio, celebrated as the place where, in 1077, the emperor Henry IV. of Germany obtained absolution from pope Gregory VII., after three days' humiliation. From this circumstance the expression "to go to Canossa" has become proverbial, being used to denote a surrender to the claims of the church. When Bismarck inaugurated his *Culturkampf* (q.v.) he publicly boasted that he would never "go to Canossa," a boast which circumstances rendered it impossible for him to make good.

CANO VA, ANTONIO, the founder of a new school of Italian sculpture, was b. Nov. 1, 1757, at Possagno, a village in the Venetian territory. Having displayed in boyhood great talent in modeling, the artist gained the patronage of Giovanni Faliero, a Venetian senator, by whom he was sent to work under a sculptor at Bassano. His first imaginative performance, "Eurydice," half the size of life, was executed in his 17th year. After this he went to Venice, where his study of art properly began. In 1779, Faliero sent him to Rome, with an introduction to Cav. Zullano, the Venetian ambassador, and one of the most illustrious patrons of art at this time in Italy. In Rome the first result of his studies appeared in the statue of "Apollo," which must be regarded as his earliest effort in ideal sculpture; but a far greater progress toward the pure style of the antique was evident in his next work, "Theseus with the Centaur." Nevertheless, C. did not rigorously adhere to the severe simplicity of the antique, but rather took pains to mitigate it by a peculiar grace and loveliness of his own, such as characterized his group of "Cupid and Psyche," which was produced soon after he had completed the monument of pope Clement XIV. This is apparent even in the colossal monument of Clement XIII. (erected in St. Peter's, 1792); though this work, on the whole, is a magnificent effort of genius, simple in style, and with nothing overwrought in the figures. Among his other works may be noticed a "Winged Cupid," "Venus and Adonis," a "Psyche holding a Butterfly;" "Penitent Magdalen," in life-size; "Hercules hurling Lichas from the Rock," a colossal work, but not free from affectation; "Kreugas and Damoxenos" (two pugilists), "Palamedes," and "Perseus with the Head of the Medusa," a work which, more than all previous efforts, served to raise his fame. In 1802, C. was appointed by pope Pius VII. chief curator of all Roman works of art in the papal states; but was soon called away to Paris, to prepare the model of a colossal statue of Bonaparte.

After the fall of the French empire, C., in 1815, was employed by the Roman government as ambassador to recover the works of art which had been taken to Paris, and paid a visit to England. On his return to Rome, he was created marquis of Ischia, with a pension of 3000 scudi. This money he expended in the support of art and artists in Rome. C. died in Venice, 13th Oct., 1822. A marble statue was erected to his memory in the church de' Frati, 1827. Another monument to C. was erected in the library of the capitol, by order of Leo XII., in 1833.

It is universally allowed that to C. belongs the honor of having restored to sculpture the position which it had lost among the modern fine arts. After Michael Angelo Buonarroti and Bernini, he was the third of epoch-making Italian sculptors. His delicate

execution and masterly treatment of marble are unrivaled, and even his faults—viz., his exaggerated nicety and carefulness, and his use of corrosives to produce fine finish—served to attract by the novel effects which they produced. The essential characteristic of all his works is sentiment—often verging, however, on sentimentalism.

During his leisure hours C. amused himself in painting, in which he attained such a degree of excellence in following the coloring of the Venetian masters, that his pictures have even deceived connoisseurs. In his private life, C. was a very amiable and benevolent man. Biographies of C. have been written by Missirini (4 vols., Prato, 1824), Cicognara (Venice, 1823), Rosini (Pisa, 1825), and D'Este (Florence, 1864).

CÁNOVAS DEL CASTILLO, ANTONIO, a leading Spanish statesman, born at Malaga, 1828. After completing a philosophical and legal education at Madrid, he entered upon a career of journalism, but was soon drawn thence into politics. In 1852 he represented his native city in the Cortés, and two years later was appointed Chargé d'Affaires at Rome, where he aided in preparing the Concordat between Spain and the Holy See. After being Director-General of the Administration from 1858 to 1861, and Under-Secretary of State in the latter year, he became, in 1864, Minister of the Interior in the Mon Ministry, and Minister of Finance and the Colonies in the O'Donnell Ministry the next year. He had the honor at this time of drawing up the law for abolition of the negro slave trade. He was one of the last to defend in the Cortés the Liberal principles he espoused, but was driven from power by Narvaez and Gonzalez, and banished shortly before the revolution of 1868, in which he had no share.

In the ensuing provisional Cortés he combated the projects of a democratic constitution, and was one of the leaders of the movement which placed Alfonso XII. on the throne. Thereupon Señor Cánovas became President of the council and chief of the new cabinet—called the cabinet of conciliation—but withdrew in September before the demands of the extreme Conservative party. He was recalled, however, in December of the same year, and particularly charged with the direction of the first legislative elections under the new rule. From this time he remained Premier, until 1879, when Marshal Martinez Campos returned from Cuba, and upon Señor Cánovas' retiring, took his place, accepting as colleagues the former's principal associates. The latter, however, was in turn obliged to resign in December, being defeated upon certain free-trade measures. Señor Cánovas returned to power in 1881, but his Conservative cabinet was soon overthrown. He was premier in 1884-5, 1890-92, and again in 1895-97; but was assassinated in August of the latter year. He wrote numerous works on political science, and a leading *History of the House of Austria*. He was the recipient of numerous decorations, among them the *Red Eagle*, from the Emperor of Germany, and the *Golden Fleece*, from the King of Spain. In 1867 he was elected member of the Academy of Madrid.

CANROBERT, FRANÇOIS CERTAIN DE, Marshal of France, b. in 1809, studied in the military school of St. Cyr, and in 1828 entered the army. In 1835, he sailed for Algeria, and during the war in the province of Oran was made a capt. In the storming of Constantine, he was one of the first who entered the breach, when he received a wound in the leg. About the same time he had the decoration of the legion of honor conferred upon him. In 1846, he became lieut.col., and soon after col. In 1848, he had the command of an expedition against the tribes of the Bouaoun, whom he defeated at the pass of Djerma, and was victorious against the Kabyles. As gen. of brigade, in 1850 he led an expedition through the rocky country of Narah, and destroyed the Arab stronghold there. In Jan., 1853, he became a gen. of division. He had the command of the first division of the French army under Marshal St. Arnaud, sent to the Crimea in 1854; and at the battle of the Alma, was wounded in the breast and hand by the splinter of a shell. On the death of the marshal, C. took the chief command of the French army. In the war in Italy against the Austrians, in 1859, C. had the command of the third division of the French army; and at the battle of Magenta, June 4, his *corps d'armée* turned the left of the Austrians. In the great battle of Solferino, on the 24th of the same month, his division was hotly engaged, and lost 1000 men in killed and wounded. In 1860, he married Miss Macdonald, a Scotch lady. When war was declared by France against Prussia, in 1870, he was one of the generals in command at Woerth, where the French received a great check. C. was shut up in Metz with Bazaine, and became a prisoner in Germany. In 1876, he became a member of the French senate. He died Jan. 28, 1895.

CANSO, CAPE, the eastern extremity of Nova Scotia, and the southern boundary of the entrance of Chebucto or Chedabucto bay. It is in lat. 45° 17' n., and long. 61° west.—2. (Strait), a passage of 17 m. in length and 2½ in average breadth, connecting the inlet just mentioned with the gulf of St. Lawrence, so as to form an island of Cape Breton. Of the three channels between that inland sea and the open ocean, it is the one that is least frequently used by European vessels.

CANTAB, OR **CANTABRIGEAN** (Latin *Cantabrigiensis*), one who is either a student or a graduate of the university of Cambridge (England).

CANTABILE, in music, is found in several significations. In general, it is placed over passages of easy and flowing melody, as well in instrumental as vocal music. In songs, the melodies which lie chiefly in the middle region of the voice are marked C.; extreme tones of the voice have a peculiar *timbre* and character quite foreign to the cantabile. C. marked at the beginning of a piece means rather slow than quick. In the C. style the finest effects can be produced by the singer in swelling, sustained sound, the portamento, etc. C. is also called *cantilene*.

CANTA'BRI, a rude race of mountaineers in ancient Spain, were of Iberian origin, and lived in the district now known as Burgos, and on the coasts of the bay of Biscay, which derived from them its name, *Oceanus Cantabrieus*. The most important of their nine towns were Juliobrica (near the source of the Ebro), Vellica, and Concana. The C. are described as like the Scythians and Thracians in hardihood and martial character, sleeping on the bare earth, enduring extreme pain without a murmur, and, like most savages, leaving agricultural toil to their women. Their bravery was evinced in the Cantabrian war, a six years' contest with the Romans, begun under Augustus, and concluded by Agrippa, 25-19 B.C. Tiberius afterwards stationed garrisons in the towns of the conquered C.; but some portion retreated into their fastnesses among the mountains, where they preserved their independence. They are supposed to be the ancestors of the Basques (q.v.).

CANTA'BRIA, a district in Spain on the s. coast of the bay of Biscay. The old geographers give the name to nearly the whole of the Biscayan coast, but it is now restricted to the province of Santander and the e. portion of Asturias; indeed, Cantabria is not now a geographical division.

CANTABRIAN MOUNTAINS, the general name of the several ranges of coast and boundary mountains, extending along the n. coast of Spain, from cape Finisterre, to the southern base of the w. Pyrenees, and so dividing the coast districts from the interior elevated plateau of Castile. The summits of the mountains here and there reach the lower line of the snow region, with a more gentle slope on the s. side, and forming plateau districts from 1600 to 2,000 ft. high on the n., where the slopes are steeper and intersected by coast rivers, leave in several parts only narrow stripes of flat coast-land, and running out into the sea form several bold promontories. The whole group of mountains is named variously by the people of various localities, and includes the Sierra de Aralar, Salvada, Anagña, Sejos, Albas, and Altuna—all more or less wild and romantic, but having those fertile and prosperous trading districts which distinguish the Basque Provinces and Asturias from the sterile central plateau of Spain.

CANTACUZE'NUS, JOHANNES, b. about 1300 at Constantinople; a statesman, general, and historian, and under Andronicus II. had principal charge of the government. When Andronicus died he was left regent, the successor being John Palæologus, then only nine years old. C. was suspected by the empress, fled from Constantinople, and got himself crowned in another place. Six years of civil war followed in which the rivals employed foreign mercenaries of every description, and nearly ruined the empire. C. formed an alliance with the sultan of Broussa, agreeing to send his daughter to his ally's harem and to permit the sultan to make slaves of the Greek subjects. In 1346, he entered Constantinople and became joint emperor with John, but retained full power during John's minority. He badly governed the almost ruined empire until 1354, when John made an easy success, and C. took refuge in a monastery, where he wrote a history of his life and times. He d. in 1383.

CANTAL, a central department of France, formed out of the s. portion of the old province of Auvergne. It has an area of 2,217 sq.mi., and a pop. in '96 of 284,882. See AUVERGNE.

CANTALIVER, or CANTLIVER, a large bracket used in architecture for supporting cornices, balconies, and even stairs. Cantalivers are often highly ornamented.

CAN'TALOUPE, or MUSK-MELON, a well-known fruit, taking its name from Cantalupo in Italy. It is extensively cultivated in the United States, and is much esteemed for the table.

CANTARINI, SIMONE, also known as SIMONE DA PÈSARO or IL PESARESE, an Italian painter, was b. at Pesaro in 1612. He studied under Guido Reni at Bologna; but his intolerable arrogance made him numerous enemies, and in consequence he left the city, and went to Rome, where he won a high reputation, and was thought by many to excel even his master in the graceful finish of his brush. On his return to Bologna, he opened a school, but shortly after accepted an invitation from the duke of Mantua to visit that city. Here also his excessive self-esteem involved him in disagreeable relations with everybody, and at last he quarreled with the duke himself, on which he left for Verona, where he died in 1648, under suspicion either of having poisoned himself, or of having been poisoned by a Mantuan painter whom he had injured. C. was distinguished in modeling and flesh-coloring. A "Madonna upborne by Angels," and a head of Guido when old, in the gallery at Bologna; and others elsewhere, remain as proofs of his skill. His 37 etchings closely resemble the etchings of Guido Reni, and have, in several instances, been fraudulently sold with the mark of the master forged upon them.

CANTA'TA, in music, is a name given to a vocal composition; but it is so very indefinite, that it in no way shows in what respect such composition differs from any other. In Zedler of Halle's great *Lexicon*, the C. is defined as a "long vocal composition, the text of which is Italian," etc.; while in Sulzer's *Theorie der Schönen Künste*, it is said to be "a short piece of vocal music of a pathetic nature," etc. The C. is always more extended and wrought out than the simple song, and consists of different movements.

CANTEEN. In England the canteen is a refreshment house for the use of the soldiers, supplying them, though not compulsorily, with articles not regularly given out by the government. The selling of intoxicating liquors was prohibited in 1847. In the United States army the canteen system consists of a number of so called *post exchanges*. These are established and maintained at every post where practicable, under special regulations prepared by the War Department. They are intended to combine the features of a gymnasium, reading and recreation rooms, supplied with books and periodicals, billiard and pool tables, etc., co-operative stores and restaurants, including a lunch counter and a canteen for the sale of malt liquors and tobacco, their primary purpose being to supply the troops at reasonable prices with the articles of ordinary use, wear, and consumption, not supplied by the government, and to afford them means of rational recreation and amusement. The secondary purpose is, through exchange profits, to provide the means for improving the messes. The sale of spirits is prohibited. When an exchange is free from debt, the net profits are distributed (*a*) to the regimental fund, (*b*) for the improvement of the garrison, the post exchange or the post library, purchase of gymnasium appliances or athletic prizes, or (*c*) they may be divided among the organizations contributing to the exchange. Individual enlisted men may not become members. Members of the exchange are organizations, companies, and detachments, such as hospital or signal corps, or band. A council fixes the amount of assessment required to entitle an organization to membership. On June 30th, 1896, 73 exchanges were in operation in the United States army, representing a net value of \$192,795. Two-thirds of the exchanges have all the features enumerated above. The net profits at the end of 1895 were \$349,151, of which \$224,979 were distributed to the various commands as dividends on their investment.

CANTEEN, besides its application to a room or building, is a name also given to a vessel used by soldiers to contain whatever beverage may be obtainable on the march or in the field. It is sometimes of tin, sometimes of wood. In the regular army, the C. is a vessel, holding about three pints, sometimes painted blue, and inscribed with the number or designation of the regiment, battalion, and company to which the soldier belongs.

There is still another use of the word C., as a name for a leathern or wooden chest, divided into compartments, and containing the plate and table-equipage for a military officer when on active service.

CANT'EMIR, ANTI'OCBUS, or CONSTANTINE DEME'TRIUS, 1709-44; the youngest son of Demetrius Cantemir. He was a member of the St. Petersburg academy; wrote satires, and assisted in fixing versification and developing Russian poetry. At the age of 30 he was sent as minister to Great Britain, and in 1736 to France. He was a successful diplomatist, and was highly esteemed both at home and abroad. Besides translating into Russian the main works of Anacreon and Horace, he wrote odes, satires, and fables, and translated important works from French and Italian.

CANT'EMIR, DEME'TRIUS, 1673-1723; a son of a Moldavian prince and heir to the throne, which, however, he never claimed, preferring to serve the Turks. In 1710, he was appointed prince to resist the expected invasion of Peter the Great. Convinced that ruin would come to the Turks, C. joined the czar and shared in the unfortunate campaign on the Pruth in 1711. When peace was made, Peter refused to surrender him to the Turks, and kept him employed in Russia, where he became a great favorite. His most important work was a history of the rise and fall of the Ottoman empire.

CANTERBURY, a municipal and parliamentary borough, a co. by itself, a cathedral city, and seat of the metropolitan see of all England, in East Kent, on the Stour, 56 m. e.s.e. of London, on the high-road from London to Dover. The distance from London by the South-eastern railway is 81 m.; by the London, Chatham, and Dover line, about 60. It stands on a flat between hills of moderate height. It has the aspect of an old town, many of the houses along the high street having gabled ends and projecting fronts. It has little manufacture or traffic. The chief trade is in corn, wool, and hops. Pop. '91, 22,700. Many are engaged in the hop-grounds. C. returns one member to parliament. It is noted for its brawn. Some remains of the walls (1½ m. in circuit and 20 ft. high) which formerly surrounded C., and one of the gates, still exist. Near the city wall is a large artificial mound, known as the Dane John (probably *Donjon*), and connected with this mound is a public garden, laid out in the end of the 18th c., from the top of which is a fine view of the country around.

Cathedral. When St. Augustine became archbishop of Canterbury, 597 A.D., he consecrated, under the name Christ's church, a church said to have been formerly used by Roman Christians. Cuthbert, the 11th archbishop, 740 A.D., added a church to the e. of this. In the course of ages, it received numerous additions, until it assumed its present magnificent form. Among those who helped to repair, enlarge, and rebuild it, were archbishops Odo (940 A.D.), Lanfranc (1070), and Anselm (1093). In 1174, the choir was destroyed by fire, and in order to the rebuilding of it, a number of French and English artificers were summoned. Among the former was a certain William of Sens, and to him, a man of real genius, the work was intrusted. The church was rich in relics: Plegemund had brought hither the body of the martyr Blasius from Rome; there were the relics of St. Wilfred, St. Dunstan, and St. Elfege; the murder of Thomas Becket (q. v.) had recently added a still more popular name to the list of martyrs. The

offerings at these shrines, especially the last, contributed greatly to defray the expenses of the magnificent work. William of Sens did not, however, live to see its completion. He was succeeded by another William, an Englishman, and to him we owe the completion of the existing unique and beautiful choir, terminated by the corona or circular chapel called Becket's crown. Gervasius, a monk, who witnessed the fire of 1174, and has left an account of it, tells us that the parts of Lanfranc's church which remained in his time were the nave, the central and western towers, the western transepts, and their eastern chapels. In the 14th c., the nave and transepts were transformed into the perpendicular style of that period. The central tower, called the Angel steeple, was carried up (1486-1504) to about double its original height, also in the perpendicular style; it is 234 ft. high, and 35 ft. in diameter. The n.w. tower was taken down in 1884; it was 113 ft. high, and divided into five stories. The Norman plinth still remains on each side of the nave in the side aisles, and portions of Norman ashlar may still be seen about the transepts outside the w. wall, and on the eastern piers of the great tower. The indiscriminate use of the "round" or "Norman," and the "pointed" or "early English" arch, is also a very striking feature in the eastern part of the building. The Lady Chapel, now called the Dean's Chapel, stands on the n. side of the church, and was built in 1468; the roof is a fan-vault. The n. transept is called the Martyrdom, for here took place the murder of Becket, on Tuesday, Dec. 29, 1170. Fifty years later, his remains were translated from the crypt to a shrine in the newly erected Trinity Chapel, eastward of the choir. About the year 1500, the yearly offerings at this shrine amounted to £4,000; but they had then declined much in value. A curious mosaic pavement still remains in front of the place where the shrine stood, and the stone steps which lead up to it are worn by the knees of countless pilgrims; but the shrine itself was demolished in 1538, and, according to tradition, the saint's remains were burned. In 1643, the building was further "purified," as it was called, by order of parliament. Still very many most interesting monuments remain—such as the tombs of Stephen Langton; that which is commonly, but wrongly, supposed to be the tomb of archbishop Theobald; with those of the black prince, of Henry IV., of archbishops Maphan, Peckham, Chicheley, Courtenay, Sudbury, Stratford, Kemp, Bouchier, Warham, and of cardinal Pole. The total exterior length of the cathedral is 545 ft., by 156 in breadth at the eastern transept. The crypt is of greater extent and loftier—owing to the choir being raised by numerous steps at the east end—than any other in England. Here in 1888 a stone coffin containing remains of a skeleton, supposed to be Becket's, was discovered and was reinterred. In 1561 this crypt was given up by Elizabeth to a congregation of French and Flemish Protestant refugees, and a French service is still held here. In 1872 the church narrowly escaped destruction for the fourth time by fire.

The archbishop of C. is primate of all England, metropolitan, and first peer of the realm. He ranks next to royalty, and crowns the sovereign. His ecclesiastical province includes all England, except the six northern counties. Among his privileges, he can confer degrees in divinity, law, medicine, and music. His seats are at Lambeth and Addington park. He is patron of 149 livings, and has an income of £15,000 a year. There are 14 old churches in C., mostly of rough flint, and containing fragments of still older structures. St. Martin's church stands on the site of one of the 7th c., and is partly built of ancient Roman brick and tile. Attached to the cathedral is a grammar school, remodeled by Henry VIII. Part of St. Augustine's Benedictine abbey still remains, with its fine gateway, near the cathedral. It occupied, with its precincts, 16 acres. The old buildings have lately received large modern additions, in order to fit them for the purposes of a missionary college in connection with the church of England. Another recent institution for education is the clergy orphan school, which occupies a conspicuous position on St. Thomas's hill, about a mile out of the city. The ruins of a Norman castle, 88 by 80 ft., the third in size in England, stands near the city wall. C. stood, in Roman times, at the union of two Roman roads from Dover and Lympne, the chief seaports of the Romans. C. was the capital of Kent, and the center from which England was Christianized. St. Augustine, the apostle of England, sent by Gregory I., was the first archbishop, and baptized king Ethelbert of Kent. C. was the Saxon *Caer Cant*, city of Kent, and capital of the kingdom of Kent. The Danes, in the 9th, 10th, and 11th centuries, often ravaged and burned the city. Henry VIII. confiscated the treasures of the cathedral, and Edward VI. levied fresh exactions from it. The cathedral suffered much in the parliamentary struggles, but it has since been repaired.

CANTERBURY, a settlement of about 14,040 sq. m., on the e. coast of South Island, New Zealand, with Christchurch as its capital, and Lyttleton as its port. The district was settled in 1850 by the Canterbury association, a society of peers, bishops, and commoners interested in the colonization of New Zealand. It has a coast-line of about 200 m., and is well watered by numerous rivers. Coal (in abundance), iron-ore, fire-clays, and quartz have been discovered in the province, and several coal-mines are in operation. On the eastern side of the great range of hills are the far-famed Canterbury plains, the great sheep district of the colony—"3,000,000 of acres rolling back in gentle rise 40 m., to the foot of the central highlands, watered by 20 rivers, and spreading n. and s. further than the eye can reach." The natural pastures of C. are very fine; and to this circumstance is mainly due the rapid advance in prosperity of the country. Pop. '91, 128,471.

CANTERBURY BELLS. See **CAMPANULA**.

CANTHAREL'LUS. See **FUNGI**, **EDIBLE**.

CANTHARIDINE. See **CANTHARIS**.

CANTHARIS (Gr. a small beetle, plural *cantharides*), a genus of insects of the order *coleoptera*, section *heteromera*. See **COLEOPTERA**. It belongs to a family called *trachelides*, or necked beetles, the head being separated from the thorax by a distinct neck or pedicle, and forms the type of a subdivision of that family called *cantharidia*, many of the species of which possess blistering properties analogous to those of the common **BLISTERING FLY**, **SPANISH FLY**, or **BLISTER BEETLE** (*C. vesicatoria*). This insect, the best known and most important of the genus, is about an inch long; has a large heart-shaped head, rather broader than the thorax; thread-like antennæ three times longer than the head; a nearly quadrangular thorax; and soft elytra (wing-covers) concealing the abdomen, and of equal breadth throughout. It is of a bright glossy green color. The common blistering fly is found in the s. of Europe, and in the s. of Siberia. It is abundant in Italy, Sicily, and Spain, in the s. of France, and in some parts of Germany and Russia. It is rare in England. The larva is not well known. The perfect insect feeds on the leaves of the ash, privet, lilac, elder, and honeysuckle; and rests on them during the night, the day being its time of activity. It is therefore taken by beating the branches of the trees in the morning or evening, when it is comparatively lethargic, a cloth being spread below to receive the insects as they fall. The gathering of *cantharides* takes place, in the s. of France, in the month of May. It requires great caution to prevent injury to those who engage in it, the insects emitting a volatile substance with a strong smell, which causes inflammation of the eyes and eyelids, convulsive sneezing, and irritation of the throat and bronchial tubes, nor can they be handled without danger of blistering. Those who collect them, therefore, generally wear gloves and veils. Unpleasant effects have been experienced from even sitting under trees on the leaves of which cantharides were numerous. Various methods are employed for killing cantharides when they have been taken; the cloths containing them are very generally immersed in hot vinegar and water, and they are afterwards carefully dried; sometimes they are killed by the vapor of vinegar, and sometimes by oil of turpentine. Unless kept with great care, they soon begin to lose their active properties, although, in stoppered bottles, they remain fit for use for years. They are very liable to be injured by mites, and afford a favorite food also to a kind of moth and to some other insects. They are imported into America from the s. of Europe, and also from St. Petersburg. See *illus.*, **BUTTERFLIES**.

The active principle of the blistering flies is *cantharidine*, which possesses such powerful blistering properties, that $\frac{1}{100}$ of a grain placed on the lip rapidly causes the rise of small blisters. Administered internally, blistering flies cause heat in the throat, stomach, intestines, respiratory organs, etc.; and if in large doses, they give rise to inflammation of a serious nature, and sufficient to cause death. Externally, they are employed as a *blistering agent*. There are various medicinal preparations of blistering flies, such as *vinegar of cantharides*, obtained by macerating blistering flies in acetic acid; *tincture of cantharides*, procured by digesting blistering flies in proof-spirit, etc.; but that most commonly employed is *plaster of cantharides* or *blistering plaster*, obtained by mixing equal parts of blistering flies, yellow wax, resin, and lard. See **BLISTER**.

CANTICLES, a word which literally signifies songs, but which is specially applied to a canonical book of the Old Testament, called in Hebrew *The Song of Songs*—i.e., the most beautiful song. The author is commonly supposed to be Solomon, and in the rich luxurious splendor of its coloring, it admirably harmonizes with the "golden time" of that magnificent monarch. The theme which it celebrates is love; but what kind of love, whether earthly or spiritual, is a question that has perplexed Biblical critics. The oldest interpretations are allegorical, and are either political or religious. The former of these, considered C. as the symbolical expression of a deep longing for the reunion of the kingdoms of Judah and Israel; the latter, of the love of God for his chosen people, the Jews. The religious interpretation passed over from Judaism to Christianity, and assumed a new aspect in consequence. Origen found the beloved bridegroom in Christ, and the bride in the church or the believing soul. Only among the theologians of the Syrian school do we find an effort made to adhere to more intelligible principles of interpretation, but the "mystical view" obtained the upper hand, and has continued to be the predominant view of the poem amongst orthodox theologians. For a while an attempt was made to distinguish between a primary and a secondary sense, both more or less directly present to the mind of the author; but modern scholarship in the main contents itself with endeavoring to fix the primary or literal meaning. Nor is this an easy task. Some commentators hold, for example, that C. is an anthology of detached idyls; others argue that it is a dramatic unity composed of connected parts. Ewald has done much to establish the latter view. Ewald's followers hold that the poem was written about the middle of the 10th c. B.C. in the northern kingdom of Israel, and conceived in a spirit of hostility against the luxurious court of Zion. Solomon, the type of a sensual monarch, has carried off to his harem a northern shepherd maiden, who in the poem appears surrounded by the ladies of his court. The king fails even by the proffer of honorable espousals to overcome the maiden's fervent attachment to her shepherd lover

in the north country, and wholly abashed, ceases to press his suit. Finally, true and chaste love triumphs in the union of the peasant lovers.

CANTING HERALDRY. Allusive or canting, or punning arms, are those in which the charges suggest or play upon the name or title of the bearers, as the martlets (Old Fr. *arondel*, young swallow,) borne by the duke of Arundel, or the device of a broken spear for Brakspeare, or the mottoes, *Ver non semper viret* for the Vernons, and *Festina lente* for the Onslows.

CANTIRE, or KINTYRE (Gaelic, headland), a long narrow peninsula of Argyleshire, running n. and s. between Arran isle and the Atlantic, and united at the n. end with the mainland of Scotland, by the isthmus of Tarbet, a mile broad between e. loch Tarbet, a small loch or bay of loch Fyne, and w. loch Tarbet. It is 40 m. long.

CANTILEVER BRIDGE, a term borrowed from architecture—cantilever meaning a bracket used to support a balcony. There are two brackets in this kind of bridge, each resting on a pier, the outer ends of the brackets projecting over the water and sustaining a central span. There are four pieces of masonry; and on these are balanced two beams, resting upon the inner piers, the shore ends of the beams being fastened to the two extreme piers; while another span rests upon their outer ends. For bridges with long spans the cantilever system is thought to be the most economical, as less material is needed than in other kinds, and very little scaffolding is required. The central span may contract or expand without danger. As one end of the central span is fastened to one of the brackets, and the other placed on rollers, the deflection from the horizontal, as compared with the suspension bridge, is very small. The principle of the C. B. was undoubtedly known to the ancients. The first plan designed in this country was by Charles McDonald, in 1875, for a proposed bridge over the East river at Blackwell's island. The first C. B. built in this country, and the first of any magnitude in the world, was the new structure over the Niagara river in 1883. There is a large C. B. over the Firth of Forth; one across the Ohio river, connecting Louisville and New Albany, and one across the Hudson at Poughkeepsie. See **BRIDGE**.

CANTON. In heraldry, the C. occupies a corner of the shield, either dexter or sinister, and in size is the third of the chief. It is one of the nine honorable ordinaries, "and of great esteem."

CANTON (from the Fr. *canton*, a corner, a district; Ger. *kante*, a point, corner, border; allied to Eng. *cantle*) signifies in geography a division of territory, constituting a separate government or state, as in Switzerland. In France, C. is a subdivision of an arrondissement.

CANTON, a city in Fulton co., Ill., on the Chicago, Burlington and Quincy, and the Toledo, Peoria and Warsaw railroads; 185 m. from Chicago, and 28 m. from Quincy. It is in a coal mining region, and has foundries, tile, brick, and marble works, agricultural implement works, cigar factories, public library, national banks, and several newspapers. Pop. '90, 5604.

CANTON, a town in Norfolk co., Mass., on the New York, New Haven, and Hartford railroad; 14 miles s.w. of Boston. It contains several villages, and has national and savings banks, public library, electric lights, churches, high school, and manufactories of copper, machinery, iron, woolen, sewing-silk, and cotton goods. Pop. '90, 4538.

CANTON, a town in Lewis co., Mo., on the Chicago, Burlington, and Quincy railroad, is advantageously situated on the Mississippi River, 200 m. above St. Louis, and 22 m. below Keokuk. It is a prominent shipping place, has a number of manufactories, and is the seat of Christian University, an educational institution under the charge of the Christian denomination. Pop. '90, 2241.

CANTON, a village and co. seat of St. Lawrence co., N. Y., on Grass River and the Rome, Watertown and Ogdensburg railroad; 60 m. n.e. of Watertown. It has a courthouse, almshouse, St. Lawrence University, and several churches. There is abundant water-power, used in the manufacture of lumber, flour, etc. Pop. '90, 2580.

CANTON, a city and co. seat of Stark co., O., on Nimishillen Creek, and on the Cleveland, Canton and Southern and other railroads, 60 miles s. of Cleveland. It is in a fine wheat-growing district, and coal, limestone, and clay for pottery and brick are found in the vicinity. It contains a fine post-office, churches, a U. S. signal service station, a high school, a public library, opera houses, electric railroads, etc. Its manufactures, which employ a capital of \$11,387,406, include iron bridges, mowing-machines, steel, cutlery, stoves, safes, woolens, and presses; and besides these articles large amounts of grain and coal are exported. In 1896, C. had 193 industries, manufacturing 6000 specific articles. There are several banks and newspapers. Population, 1860, 4041; 1880, 12,258; 1890, 26,189; est. '96, 40,492.

CANTON, a large commercial city and port in the s. of China, and capital of the province of Kwang-tung (of which the name C. is merely a corruption). It is situated in lat. 23° 7' 10" n., and long. 113° 14' 30" e., on the n. side of the Chookeang, or Pearl river, in a rich alluvial plain, 32 m. from the sea. The river (the entrance to which is known by the name of the Boca Tigris, a Portuguese translation of the Chinese *Hu-mun* ("Tiger's Mouth"), is very picturesque. The city is surrounded by a brick rampart 6 m.

in circumference, and entered by 12 gates, to each of which a guard-house is attached. It forms an irregular square, and is divided by a wall into the n. and s., or old and new city. The former is inhabited by the Tartar population, the latter by Chinese; and between the two, communication is maintained by four gates in the separating wall. The suburbs are very extensive, and in one of these, facing the river, stood the European factories or *hongs*. Most of the streets of C. are crooked and labyrinthine beyond description, but there are a small number of straight thoroughfares which make it easy enough for a stranger to find his way. As a rule, a tolerably straight street leads from the water-side to each gate of the city on the southern front, and is more or less prolonged through the interior. Many of the streets are devoted to distinct trades; thus, there is "Carpenter" street, "Apothecary" street, etc. The Joss-houses, chiefly Buddhist temples, are said to be 124 in number. The largest of these, on Honam island, covers seven acres, and has 175 priests attached. It is called *Hae Chwang Sze*, or "the temple of the ocean banner." Another famous structure is "the temple of the five hundred gods," situated in the western suburbs. There are also several many-storied towers or pagodas, a Mohammedan mosque, founded about A.D. 850 by the Arabian voyagers, who then were accustomed to visit C., a foundling-hospital, an English and an American missionary hospital. Streets of wooden houses were formerly to be seen on the river-side, but these were swept away during the late quarrel with Yeh; and one large site that they occupied was walled in for the purpose of erecting new foreign factories, the old ones having been totally destroyed by fire. A very remarkable example of life upon the water is the boat-town of Canton. The total population of the city has been vaguely estimated at 2,000,000. The *climate* of C. may be pronounced healthy; though the heat from June to Sept. is oppressive, and the thermometer sometimes, though rarely, stands at 100° in the shade. In ordinary years, the winter minimum is 42°, and the summer maximum 96°. The n.e. monsoon commences in Oct., and is the prevailing wind till Mar., when the s.w. monsoon sets in. Its average temperature is 70½° F., and the annual fall of rain 70.625 inches. The Cantonese are notorious for their turbulence and hatred of foreigners, and the European factories have more than once been attacked by infuriated mobs, who were only kept at bay by force of arms. This hostility may, however, be greatly due to the baneful influence of those in power; for here the government of the mandarins of the present Manchu Tartar dynasty appears to have reached its maximum of corruption and barbarity, and was fitly represented by the notorious Yeh, late governor-general of Kwang-tung and Kwang-se. The author of *Twelve Years in China* gives us some startling facts illustrative of mandarinic rule in this part of China. After the defeat of the Triad rebels, who besieged C. in 1844-45, it is estimated that 1,000,000 of people perished in the province.

The admirable situation of C. for conducting traffic explains how, from an early period, it was a favorite port with foreign merchants. The Arabs, as has been said, made regular voyages hither as early as the 9th century. The Portuguese found their way to it in the 16th c., and were followed by the Dutch a hundred years later. These in turn were overtaken and supplanted by the English before the close of the 17th c., and an immense trade was carried on by the agents of the East India company. Their monopoly ceased on the 23d April, 1834. Since that date the proceedings of the C. government officers have originated two wars with the British. The city was captured by the allied French and English forces Dec., 1857, and continued to be garrisoned by them till Oct., 1861. See CHINA. Until 1842 Canton was the only port at which foreign shipping was permitted to enter by the Chinese government. After the treaty of Nankin (signed Aug. 29, 1842), C. was known as one of the five ports; Amoy, Foochow, Ningpo, and Shanghai having also been thrown open to foreign commerce.

Foreign commerce, however, is still hampered in many ways in C. The lekin duties press most heavily on foreign merchants; ocean steamers have been compelled to discharge their cargo at Whampoa; and the general insecurity of property renders it necessary that every shop which contains anything of value should be barricaded at dusk, so that it could stand a siege; at sunset business must stop.

The chief exports from C. are tea, silk, matting, fire-crackers, etc.; the chief imports, cotton, woolen, and metal goods, food stuffs, opium, kerosene, etc. The harbor is filled with vessels and rafts. The greater part of the foreign shipping is in the hands of the British. It is one of the chief ports for foreign trade in China, surpassed, perhaps, only by Shanghai; but the opening of the northern ports has diverted much of the trade with C., especially that in tea.

CANTON, JOHN, 1718-72; an English natural philosopher, who made valuable discoveries in the then new science of electricity. For constructing artificial magnets he was honored with the membership and a gold medal of the royal society, and in 1751 he became one of the council of the society. He was the first person in England to verify Franklin's theory of the identity of lightning and electricity, having, in 1752, obtained fire from the clouds during a thunder-storm. He and Franklin almost simultaneously discovered that some clouds were charged with positive and others with negative electricity, a circumstance that made them warm personal friends. C. opposed the theory then generally accepted that water was incompressible.

CANTONMENTS, in the general operations of European armies, are temporary resting-places. Many circumstances, especially the state of the weather and the supply of food, influence a gen. in determining whether to go into C. or to encamp, in the intervals between active operations; or he may take the former course during an armistice. The quartermaster-gen. previously examines the district, and determines how many men and horses to place in each village; arrangements are also made for a main-guard, cavalry pickets, alarm-posts, road-barricades, lines of sentries, mounted orderlies, etc., to guard against a sudden surprise from the enemy. In C. the men are not generally under canvas, as described in **CAMP**.

In India, C. are *permanent* places, regular military towns, distinct and at some little distances from the principal cities. If on a large scale, such a cantonment contains barracks for European cavalry, infantry, and artillery; rows of bungalows or houses, each inclosed in a garden, for the officers; rows of huts for the native soldiery; magazines and parade-grounds; public offices and buildings of various kinds; and a bazaar for the accommodation of the native troops. During the revolt in 1857-58, most of the outbreaks began in the cantonments. It was in the cantonment outside Cawnpore that Nana Sahib commenced his treachery.

CANTONNÉE, in heraldry. When a cross is placed between four other objects, e.g., scallop shells, it is said to be *cantonnée*.

CANTOR. See **PRECENTOR**.

CANTU, **CESARE**, one of the best of modern Italian authors, was b. Sept. 5, 1805, at Brescia, in northern Italy, and was educated at Sondrio, where he was appointed professor of *belles-lettres*. Having been imprisoned for the offense of expressing liberal tendencies in a historical work on Lombardy, C. spent his leisure hours in describing the sorrows of a prisoner in the form of a historical romance, *Margherita Pusterla* (Florence, 1845). Cantu also wrote several religious hymns and songs, which have become popular; but his great work is the *Storia Universale* (35 vols., Turin, 1837-42). His *History of Italian Literature* appeared in 1851; *History of the Last Hundred Years* (1852); *History of the Italians* (1859); and *Milano, Storia del Popolo e pel Popolo* (1871). He died in 1895.

CANTURIO, or **CANTU'**, a t. in northern Italy, 5 m. s.e. of Como. It is situated in the midst of a rich district, has a church with an elegant tower, which served as a beacon during the middle ages, and manufactures of iron-wares. Pop. 8000.

CANUCK (also **CANNUCK**, **CUNNICK**) is a name applied in the U. S. to any Canadian, while the English Canadians use it to denote a Canadian of French birth. According to Norton's *Political Americanisms*, it was first applied by the French to the English, and is a corruption of *Connaught*. Some scholars, however, believe it to be of Indian origin.

CANUN, a Turkish musical instrument, strung with gut-strings; is played on by the fingers, on which are thimbles of tortoise-shell, pointed with pieces of cocoa-nut, forming plectra for striking the strings with. The C. is a favorite instrument with the ladies in seraglios, many of whom produce very pleasant music and harmony on it.

CANUTE, or **CNUT**, succeeded to the rulership of the Danes in England on the death of his father, Swein or Sweyn, and was by them proclaimed king of England. On the death of Ethelred, he shared the sovereignty with Edmund Ironside, who ruled over the s., while C. was monarch over the n. of England. The sudden decease or assassination of Edmund made C. sole ruler in 1017, and he continued to reign until his death, in 1035 or 1036. His rule was marked at first by cruelty, but when all who were likely to interfere with his power had been disposed of, he exhibited great mildness and justice, combined with talent and judgment. The Anglo-Saxons, whose complete subjugation he had effected, did not feel their chains: they had experienced no such good government since the time of Alfred and Athelstane. He was easily accessible to all his subjects; and won the hearts of the people by his love song and ballad, and his liberal patronage of gleemen. One verse of an English song written by C. is still extant. As soon as English affairs were settled, C. superseded his brother Harold as king of Denmark; and in 1028 he extended his dominion over Norway—becoming thus one of the most powerful princes of Europe. In his latter years he was devout.

CANVAS, regarded from an artist's point of view, is the principal material upon which oil-paintings are made. Two kinds are prepared for this purpose, of which the best is called *ticking*. Before it is put into the artist's hands, it is usually *primed*, or grounded (see **GROUND**) of a neutral gray, or other tint, as he may direct. Certain sizes of C. being in greater request than others, are kept ready stretched on frames. Those used for portraits are known by the names of *kit-cat*, which measures 28 or 29 in. by 36; *three-quarters*, 25 by 30 in.; *half-length*, 40 by 50; *Bishop's half-length*, 44 or 45 by 56; *Bishop's whole length*, 58 by 94.

CANVAS, SHIP'S. See **SAIL, SAILCLOTH**.

CANVAS-BACK, *fuligina (aythya) vallisneria*, a species of duck frequenting the Atlantic coast of the United States, greatly prized for its flesh. The canvas-back reaches

its highest perfection in and around Chesapeake bay, where these birds pass the winter after returning from their breeding grounds in the far north-west. In its annual migrations it is taken in great numbers in the marshes which surround the southern extremity of lake Michigan, where the *zostera vallisneria*, or so-called wild celery, known to be identical with the plant of that name in the Chesapeake bay, abounds, the root of which is the favorite food of this duck. The male is showily marked with red, black, and white, and the lower part of the back, which is of an ashen hue, is broken by fine lines of black into divisions or squares like those in a piece of canvas. The canvas-back is noted for its swift flight, for an insatiable curiosity which leads it to approach within gunshot if its attention is attracted by any unfamiliar object on shore, and for its delicate flesh, which is highly esteemed by epicures. The red-head duck (*F. Americana*) is an allied species.

CANZONE is the name of one of the oldest and most prized forms of the Italian lyric. The word is borrowed from the Provençals, whose *cansós* or *chansós*, however, were not restricted to any precise form, but were simply verses intended to be sung. The Italian writers first attempted to regulate the wayward and arbitrary character of the Provençal *cansós*; Dante, and subsequently Petrarch, being especially successful. The *canzone Petrarquesca* or *Toscana* was any considerable lyrical poem, composed of stanzas exactly corresponding to one another in number of lines, measure, and position of rhymes, and which customarily closed with a short stanza. About the end of the 16th c., the Italian writers began to deviate from the strict form of the Petrarchian *canzone*. Torquato Tasso and Chiabrera are the most notable names in the new movement. The most of the canzones of the latter—called by their author *canzonette*—are written in short lines and stanzas, the position of the rhymes being also completely arbitrary.

CANZONET, a diminutive of the Italian *canzona*—a variety of lyric poetry, which closely resembled the madrigal. Canzonet is applied to short songs of light and airy texture. Morley published canzonets selected from Italian composers in 1597; and Haydn left two examples, *She never told her love* and *My mother bids me bind my hair*.

CAOUTCHOUC. See INDIA RUBBER.

CAP, in ship-building, is a strong, thick block of wood fixed near the top of each mast; it has a hole to receive the upper end of the lower mast, and another to receive the lower end of the topmast, with eyebolts to aid in hoisting the topmast. There is also a C. of smaller size at the point of junction between the topmast and the top-gallant-mast. When made of iron, the C. is called a *crance*.

CAP. See PERCUSSION CAPS.

CAPABILITY BROWN, a successful landscape gardener of the last century, much inclined to the use of the word "capability."

CAPACCIO, a town in the province of Campania, Italy, 25 miles s.e. of Salerno. Population about 3000.

CAPACITY, LEGAL, is such a condition of individuals, in regard to their natural qualities and actual position under the constitution of the country, as fits them for the application of the laws civil and criminal. Generally speaking, all persons have this legal capacity excepting aliens, persons attainted, convicts, insane persons, and to some extent also infants, married women, and persons under duress. See ALIEN; ATTAINDER; CRIME; FEME COVERTE; HUSBAND AND WIFE; INFANT; LAW OF CONTRACTS; LUNACY; MARRIAGE.

CAP-À-PIE (Fr. head to foot), in the military language of the middle ages, was applied to a knight or soldier armed at all points, or from head to foot, with armor for defense and weapons for attack.

CAPARISONED, in heraldry. A war-horse completely furnished for the field is said to be caparisoned.

CAPE, in geography, the extremity of a portion of land projecting into the sea beyond the general line of the shore. On a low sandy coast, a C. generally forms an obtuse angle, being merely a change in the trending of the land. On rocky shores, capes usually form acute angles, and are here sometimes called points or promontories.

CAPE AGULHAS. See AGULHAS.

CAPE ANN, in n.e. Massachusetts, 31 m. from Boston; 42° 38' n., 70° 35' w.; has two fixed white lights on Thatcher island, 161½ and 165½ ft. above mean high water, visible for 19 nautical miles; also a 10-in., steam fog whistle. There are valuable stone-quarries at the cape. The whole rocky peninsula generally included under this name, projects about 20 m. into the Atlantic ocean. The s. and e. shores have many attractive summer resorts.

CAPE BAB-EL-MANDEB. See BAB-EL-MANDEB.

CAPE BIANCO, the most northerly point of Africa, on the Mediterranean; 37° 20' n., 9° 48' east.

CAPE BLANCO, or ORFORD, in s.w. Oregon, $42^{\circ} 45' \text{ n.}$, $125^{\circ} 45' \text{ w.}$; 25 m. from the mouth of the Rogue river. A little s. of the cape is Port Orford. There is a fixed white light on the extreme w. point of the cape, 256 ft. above sea level.

CAPE BLANCO, on the w. coast of Africa. See BLANCO.

CAPE BOE' O, the w. point of Sicily, a mile from Marsala; $37^{\circ} 28' \text{ n.}$, $12^{\circ} 25' \text{ east.}$ Off this cape, in 241 B.C., the Romans gained a naval victory over the Carthaginians, closing the first Punic war.

CAPE BOJADOR'. See BOJADOR.

CAPE BRETON, a rocky island of irregular form in British North America, stretching in n. lat. between 45° and 47° , and in w. long. between 60° and $61^{\circ} 30'$. It is separated from the peninsula of Nova Scotia by Chebucto or Chedabucto bay and the gut of Canso; contains 3120 sq. m., with a pop. (1891) of 86,854. Its principal exports are pine, oak, birch, maple, fish, and coal. Though the island produces maize and other grains, yet it depends for its breadstuffs chiefly on the United States. C. B. originally a French possession, was taken by the English in 1745; but being subsequently restored to France, it was again captured in 1758, and ceded in 1763. After having been for a time a distinct colony, it now forms part of the province of Nova Scotia. The towns are Sydney, Arichat, and Port Hood, the once famous Louisbourg, stripped of its fortifications, having become merely a village.

CAPE BRETON, a co. in e. Nova Scotia, a part of the island of the same name, nearly surrounded by the ocean; pop. '91, 34,244. Coal is the chief production. Chief town, Sydney.

CAPE CANAVERAL, about the middle of the Atlantic coast of Florida, $28^{\circ} 27' \text{ n.}$, $80^{\circ} 33' \text{ west.}$ It has a light flashing white every minute, 137 ft. above mean high water. There are dangerous shoals around the cape.

CAPE CHARLES, at the n.e. entrance of Chesapeake bay, Virginia. On Smith's island is a flashing white light, signaling "45" every 30 sec., 180 ft. above mean high water. This cape is the extreme s. projection of the "eastern shore" of Maryland.

CAPE CLEAR, a high promontory on the s. side of Clear island, co. Cork, Ireland, usually the first land seen when steamers are approaching England from America. There are two lights, one in $51^{\circ} 26' \text{ n.}$, $0^{\circ} 29' \text{ w.}$; and one on Fastnett rock, $3\frac{1}{2}$ m. n.w. by s. from the cape, 148 ft. above high water.

CAPE COAST CASTLE, formerly the capital of the settlement of Great Britain in north or upper Guinea, lat. $5^{\circ} 5' \text{ n.}$, and long. $1^{\circ} 13' \text{ west.}$ The place, as its name implies, is defended by a fort, or rather by three forts. It has a pop. of 10,000.

CAPE COD, the sickle-shaped peninsula forming the south-eastern extremity of Massachusetts, and nearly co-extensive with Barnstable county, extending from Sandwich to Race point in lat. $42^{\circ} 3' 40' \text{ n.}$; long. $70^{\circ} 4' 18' \text{ west.}$ It is about sixty-five miles long, and beyond Sandwich rarely exceeds eight miles in width; encloses Cape Cod bay, and is broken by many harbors, that of Provincetown being one of the best on the New England coast. On the seaward side or highlands is a fixed white light, 183 ft. above mean high water, and at Race point is a fixed white light varied by a white flash every 90 sec., 41 $\frac{1}{2}$ ft. above high water. Discovered by Gosnold (q.v.) in 1602, and named from the abundance of the fish in its waters, the cape was visited by Henry Hudson in 1609, who supposed it to be an island, and called it New Holland. Charles, Prince of Wales, attempted to change the name to Cape James in honor of his brother. The cape is sandy, and in part consists of rolling grass-land, but there are fertile portions, and toward the north it is well wooded. Small ponds abound, and salt marshes border the southern shores. The Old Colony railroad extends through the peninsula, and a ship-canal to connect Cape Cod and Buzzard's bays has been partly constructed. See Thoreau's *Cape Cod*.

CAPE COLONY. See CAPE OF GOOD HOPE.

CAPE COM'ORIN. See COMORIN.

CAPE DIAMOND, the high rock at the junction of the St. Lawrence and the St. Charles, on which stands the citadel of Quebec.

CAPE DISAPPOINTMENT, or CAPE HANCOCK, the s.w. point of the state of Washington, at the entrance of Columbia river; $46^{\circ} 16' \text{ n.}$, $124^{\circ} 2' \text{ w.}$; has a white light 232 ft. above the water.

CAPE DUCATO. See DUCATO.

CAPE ELIZABETH, in the town of that name in Cumberland co., Me., 6 m. s.e. of Portland, $43^{\circ} 33' \text{ n.}$, $70^{\circ} 11' \text{ w.}$ There are two lights, one fixed and one fixed with white flashes. The town is a suburb of Portland, and a popular summer resort; pop. '90, 5459.

CAPE FAREWELL, the s. point of Greenland, a precipitous headland on an island; $59^{\circ} 49' \text{ n.}$, $43^{\circ} 54' \text{ w.}$ The currents, the ice, and the winds combine to make this probably the most boisterous point on the globe.

CAPE FEAR, the s. point of Smith's island at the mouth of Cape Fear river in North Carolina; $33^{\circ} 48' \text{ n.}$, $77^{\circ} 57' \text{ w.}$ On Bald head is a white light flashing every 30 sec.

CAPE FEAR RIVER, in North Carolina, formed by the Haw and Deep rivers, and affording navigation from the ocean to Wilmington, and further for steamboats. It enters the Atlantic n. of Smelt island.

CAPEFIGUE, BAPTISTE HONORÉ RAYMOND, a French publicist and historian, was b. 1802 at Marseilles. He studied law at Aix, and in 1821 proceeded to Paris, for the purpose of completing his judicial course, but soon betook himself to journalism and authorship. He held a post in the foreign office until 1848. This, however, did not interfere with his amazing activity. Besides contributing extensively to many of the Parisian journals, C. also "manufactured" not less than a hundred volumes of history—not, indeed, intrinsically valuable, but indicating wonderful facility in the use of the pen. The best is the *Histoire de la Restauration* (3d edit., 1842). C. also published of late years many interesting biographical works. He d. 1872.

CAPE FINISTERRE'. See FINISTERRE.

CAPE FLATTERY, the extreme w. point of the United States (except Alaska), in the state of Washington, s. of the strait of Juan de Fuca. On Tatoosh island is a fixed white light, with a fixed red sector between s.e. $\frac{1}{2}$ s. and s.s.e. $\frac{2}{3}$ e.

CAPE FLORIDA, the s. extremity of Key Biscayne in Dade co., Fla., e. of the Everglades.

CAPE GATA, or **CAPE DE GATTE**, a promontory of Spain in the province of Granada, extending into the Mediterranean; a mass of rock about 24 m. in circumference. The most notable of the pile is the ancient Promitorium Charidemi, the Moorish Kheyran, and is formed chiefly of agates, spars, and crystals. The cape was once a resort of Moorish pirates.

CAPE GIRARDEAU, a co. in s.e. Missouri, on the Mississippi, and the St. Louis and Iron Mountain railroads. It is level, fertile, and well cultivated; producing wheat, corn, oats, potatoes, tobacco, etc.; 540 sq. m.; pop. '90, 22,060, includ. colored. Co. seat, Jackson.

CAPE GIRARDEAU, a city in the co. of the same name in Missouri; on the Mississippi river and several railroads; 50 m. above Cairo, Ill. It is in a rich and well-cultivated section. St. Vincent's college, Roman Catholic, and the Southeast Missouri State Normal school, are the principal public institutions. The city has large river commerce. Pop. '90, 4297.

CAPE GUARDAFUI'. See GUARDAFUI.

CAPE HATTERAS is the point on the coast of North Carolina stretching furthest into the Atlantic, and by far the most dangerous part of the American coast for navigators, on account of shoals and frequent gales and storms. Coasting vessels are apt to be crowded up toward this cape by the gulf stream, which is only about 20 m. east. The cape has a light, flashing white every 10 sec., 191 ft. above mean high water, also a beacon light, flashing white, 27 ft. high. Cape Hatteras is one of the most desolate regions on the U. S. coast.

CAPE HAYTIËN (formerly called *Cape Français* and *Cape Henri*), a seaport t. of the island of Hayti, on its n. coast, in lat. $19^{\circ} 40' \text{ n.}$, long. $72^{\circ} 54' \text{ west}$. It is pleasantly situated on a small bay, partly encircled by hills, has wide and well-paved streets, and some handsome squares. A great portion of it, however, is in ruins, the effects of the revolutionary wars at the end of last century. Safe anchorage is found within the harbor, which, however, is rather difficult of access. C. H. carries on a considerable trade with the United States. Pop. estimated at 29,000.

CAPE HENLOPEN, on the e. coast of Delaware, at the s. entrance of the Delaware bay, 13 m. s.s.w. of Cape May, which is in New Jersey, on the other side of the entrance. Cape Henlopen is in $38^{\circ} 47' \text{ n.}$, $75^{\circ} 5' \text{ w.}$, and has a fixed white light, with a fixed red sector between s.e. $\frac{1}{2}$ e. and s. $\frac{1}{2}$ e., 126 ft. above mean high water.

CAPE HENRY, on the coast of Virginia, at the s. entrance to Chesapeake bay, opposite to Cape Charles in Maryland; $36^{\circ} 56' \text{ n.}$, $76^{\circ} 4' \text{ w.}$; has a fixed white light, with a fixed red sector between s.s.e. and s.w. by w., 157 ft. above mean high water.

CAPE HORN, or **HOORN**, the most southerly point of America, terminating an island of its own name, in the archipelago of Terra del Fuego. It is in lat. $55^{\circ} 58' 40'' \text{ s.}$, and long. $67^{\circ} 16' \text{ w.}$, having a perennially antarctic climate, and being in itself merely a detached link, bare and rugged, of the chain of the Andes. It was discovered by Schouten, a native of Hoorn in Holland, about 90 years later than the Strait of Magellan, and since then the course of navigation of sailing vessels has been round the cape instead of through the strait.

CAPEL, ARTHUR, Lord, 1610–49; representative of Hertford, in the long parliament of 1640. He was a royalist officer, acting with lord Colchester and Edward Hyde as a general, and was in the actions of Bristol, Exeter, and Taunton. At Colchester,

he was compelled by famine to surrender to Fairfax. He was tried for treason and executed Mar. 9, 1649. He was the author of *Daily Observations or Meditations*.

CAPEL, THOMAS JOHN, b. 1836; an English Roman Catholic priest. When but 17 years old, he, with others, founded a normal training college for the education of school-teachers, of which, in 1856, he was made vice-principal. Being compelled to seek southern Europe on account of ill health, he founded at Pau a mission for English-speaking Roman Catholics, in consequence of which the pope advanced him to "monsignore," a position equivalent to that of bishop. Returning to England, in 1873 he established the Roman Catholic public-school at Kensington, and devoted much of his time to preaching, becoming widely noted for his eloquence. He is said to be the original of Catesby in D'Israeli's *Lothair*. In 1874, he published a *Reply to Gladstone's Political Expostulation*, and in 1884 "*Catholic*," *An Essential and Exclusive Attribute of the True Church*. He lived in California many years.

CAPEL COURT, in Bartholomew Lane, London, the place of meeting for the British Stock Exchange, and so by metonymy often used as equivalent to the stock exchange. Previous to 1773, the London stock brokers conducted their business in and about the Royal Exchange, but in that year, having formed themselves into an association under the name of the Stock Exchange, they removed to Capel Court. In 1801, the growth of business necessitated the erection of a new building in Capel Court. In 1854, and again in 1885, considerable additions were made to the buildings, which now include two large halls, where the various markets are held, settlement rooms, reading room, committee rooms, managers' rooms, and other offices. It is intended ultimately to remove the partition between the two halls, when one vast business apartment, having an area of about 16,000 square feet, will be available for the use of members.

CAPE LA HAGUE, a promontory of France, forming the n.w. extremity of the peninsula of Cotentin, in the department of Manche. It juts out into the English channel, opposite the island of Alderney, and about 16 m. n.n.w. of Cherbourg, and 50 m. s. of St. Alban's Head, in Dorsetshire.

CAPE LA HOGUE, often confounded with cape la Hague, is situated on the e. side of the same peninsula. Here the English and Dutch fleets defeated the French in 1692.

CAPELIN, *Mallotus Greenlandicus*, a small fish of the family of *salmonida*, extremely abundant on the coasts of Newfoundland, and much used as bait in the cod-fishery. It is also, in a dry state, an article of commerce, and is imported, although not very largely, into Britain, where it sometimes appears on the breakfast or supper table. Its flavor, which is very agreeable, suggests to most persons the idea of its belonging to the herring rather than the salmon family. It is nearly allied to the smelt.

CAPELLA, a bright star of the first magnitude, on the left shoulder of Auriga. C. is also called Capra or the *She-goat*, a name also sometimes given to Capricorn.—The poets fable C. to be Amalthea's goat, which suckled Jupiter in his infancy.

CAPELLA. See A CAPELLA.

CAPELLA, MARTIANUS MINEUS FELIX, a learned author belonging to the second half of the 5th c., was born in Africa, but where is not definitely ascertained. Of his life nothing whatever is known. The work which has preserved his name to posterity is the *Satiricon*, a kind of encyclopædia, highly esteemed during the middle ages as a work of reference. It is written in a medley of prose and verse, and is full of curious learning, but possesses no literary value; the style has all the bombastic pomp of the African school of later Latinists. It consists of nine books. The first two consist of an allegory, *The Nuptials of Philology and Mercury*, while the remaining seven are devoted to the "liberal arts," grammar, dialectics, rhetoric, geometry, arithmetic, astronomy, and music. The first edition of the *Satiricon* appeared in 1499, under the care of Franciscus Bodianus; the best in 1886, under the care of Eyssenhardt.

The book on astronomy is remarkable as containing a hint of the true theory of the solar system. Mercury and Venus are there declared to move round the sun, and not round the earth; and their relation to these bodies is properly explained.

CAPE LOOKOUT, on the e. coast of North Carolina, 85 m. s.w. of cape Hatteras; 34° 7' n., 76° 33' w., having a fixed white light 156 ft. above mean high water.

CAPE MATAPAN', the s. extremity of the continent of Europe, in Greece, between the gulf of Laconia, and Kalamatia, 36° 23' n., 22° 29' east. The ancient Greeks called it Tenarium, and made it sacred to Neptune, whose temple stood near the cape.

CAPE MAY, the s. point of New Jersey, at the n.e. entrance to Delaware bay. There is a "light flashing white every 30 sec., 164½ ft. above mean high water."

CAPE MAY, a co. in s. New Jersey, on the ocean and Delaware bay, intersected by the South and West Jersey and other railroads; 255 sq. m.; pop. '90, 11,268. The surface is level, and somewhat swampy, with alluvial soil, producing grain, hay, and fruit. In one of the swamps is a deposit of cedar trees, the timber of which is still good, though it must have been underground more than 2000 years. Co. seat, Cape May Court-house.

CAPE MAY, a city, and celebrated wateringplace, in Cape May co., N. J.; connected with Philadelphia by railroad; sometimes called Cape City or Cape Island city. There is a fine beach several miles long, and the bathing facilities are of the first order. The hotels are numerous, and of modern construction, and in summer the place is the favorite resort of Philadelphians as well as of people from cities more remote. The climate is usually equable and pleasant. Pop. '90, 2136.

CAPE MENDOCINO, in Humboldt co., Cal., the extreme w. point of the state; 40° 26' 24" n., 124° 23' 27" west. There is a flashing light 423 ft. above the water.

CAPE NORTH. See **MAGEROE**.

CAPE ORTEGAL, the n. extremity of Spain, projecting into the bay of Biscay in the province of Corunna; 43° 47' n., 7° 56' w.; on a rugged and barren coast.

CAPE OF GOOD HOPE, popularly regarded as the most southerly promontory of Africa, though it is half a degree to the n. of Cape Agulhas. The latter is merely a projection on a coast-line, which diverges inconsiderably from a parallel; but the former is really the turning-point from s. to e. on the voyage from Europe to India. This celebrated promontory is in lat. 34° 22' s., and long. 18° 29' e., being the termination of Table mountain, which, as it recedes towards the bay of its own name, rises from the height of 1000 ft. above the sea to that of 3,532. The cape (for so it is called by way of eminence) was discovered and doubled by Diaz, a Portuguese navigator, as early as 1486—six years before Columbus, in aiming at the same goal by a different route, led the way to America. But it was only in 1497 that Vasco da Gama realized the value of Diaz's discovery, by rounding it on his adventurous voyage from Lisbon to Calicut. The result was not merely to open a new channel for the traffic of the east, but it was also to transfer trading superiority from the republics of Italy to the states of Western Europe.

CAPE OF GOOD HOPE, a British colony, was so called from the cape on its s.w. extremity. It was established by the Dutch in 1652, some attempts at a settlement having been previously made by the Portuguese. The former only intended it at first as an intermediate station between Holland and their East Indian possessions; and at first occupied only a small tract of ground on the slopes of Table Mountain, with some portion of the adjoining flats; but they had in their neighborhood scattered tribes of improvident natives, singularly feeble of purpose, and incapable of organization on a large scale. The tide of immigration set in from Holland, and when the country was finally taken possession of by the British in 1806 (there having been a brief occupation of it from 1796 till 1803), the Dutch had extended their dominion as far to the e. as the mouth of the Great Fish river, and from that point in a waving line across the country to the w., a little s. of Orange river.

In entering upon the government of this large territory, the British found themselves face to face with a race of a totally different sort from that of the purposeless Hottentot—a people styled Kaffirs, mainly of Arab descent, consisting of tall, athletic, finely formed men, of warlike dispositions, with an incurable propensity to steal from any one, provided he was not of their own tribe, and particularly so if he was a foreigner. The inevitable result was a succession of wars—those, namely, of 1812, 1819, 1828, 1835–36, 1846–47, 1851–52.

CAPE COLONY proper is bounded on the n. by the Orange river and the Kei. But of late the area of this British possession has been greatly extended by the annexation of districts lying to the northward. Of these successive annexations the most important are that of British Kaffraria (see **KAFFRARIA**) in 1866; of Basuto-land, lying in the upper basin of the Orange river, in 1868; of two vast districts across the Kei called Fingo-land and Noman's-land, now called Griqualand East (q. v.), in 1875; of Griqualand West, in 1876; and of the Transvaal (q. v.) in 1877. The area of Cape Colony with its districts is 221,311 sq. m.; and its pop. in 1891 was 1,527,224, of whom 376,987 were Europeans.

The highest range of mountains within the colony is 9,000 ft. above the sea. The mountains keep at a distance from the coast-line of from 30 to about 100 m., and receive different names on their course, such as the Stormberg, Sneeuwberg, Nieuwveld, Roggeveld, and Kamiesberg. Between this principal range and the sea on the e., there are two other ranges less continuous and regular, the intermediate one generally more distant from the first than they are from each other.

South Africa being not far from the region of the trades, s.e. winds prevail, especially in the summer time; the only other wind that may be said to blow is that from the n.w., which prevails during the colder months. But whichever of these two winds predominates—the one bearing a supply of rain from the Indian ocean, the other, if less frequent, more richly laden from a part of the Atlantic nearer the line than the country which it fertilizes—it fails to deposit its stores on the opposite side of the principal water-shed which crosses its path. Hence the curious fact of the transposition of seasons in the same latitude. As the harvest in such latitudes depends more on the supply of rain than anything else, people are reaping on the one side of the country whilst they are sowing and planting on the other. Certain parts of the country are liable to long continued droughts, because while very heavy rain-falls take place, the rain is confined to a particular part of the year. The country, however, is admirably adapted

for the storage of water. In many places one meets with the successive beds of dried-up lakes, with a narrow outlet at the lower ends, through which a periodic stream flows. By closing up this outlet, artificial lakes or dams may be formed to almost any extent, and of unlimited number; and from the steepness of the slope, the lands lower down admit easily of being laid under water.

The mineral wealth of the colony is very great. There are remarkably rich diamond fields in West Griqualand, and for several years diamonds were the most important article of export. One of the chief towns in the colony, Kimberley, owes its rapid growth and prosperity to the diamond mining. The exports of diamonds in 1895 amounted to £4,775,016, and were the chief among the articles of colonial production, for although the gold exported in that year was nearly £8,000,000 it really was imported from Transvaal for re-exportation. The next mineral in importance is copper ore. Coal is also found, and its output has increased since the construction of railways. Among other minerals may be mentioned manganese, lead ore, iron ore, and zinc blende. In regard to manufactures there were, according to the census of 1891, upward of 2,000 industrial establishments, including flour mills, breweries, tobacco factories, tanneries, together with diamond, gold, copper and coal mines. The rearing of live stock is the principal employment, and the graziers for the most part own the lands which they occupy.

There is in the colony almost a total want of navigable rivers, but the system of railways is rapidly extending. In 1880, there was a mileage of about 600 miles open for traffic, the existing lines being mainly connected with three systems—the western, starting from Cape Town; the Midland, starting from Port Elizabeth; and the North-western, also from Port Elizabeth. The railways are all the property of the government. Direct telegraphic communication with Europe was established, in 1879, by the East African submarine cable from Aden to Natal, and thence by the land lines. The shipping at Cape Town is now secure by a breakwater and docks. The same cannot be said of Port Elizabeth, East London, and the Kowie; but measures are being taken which, it is hoped, will result in making these also safe from the fierce s.e. winds.

This splendid country is at present occupied by an assemblage of very varied races. The Portuguese were the first Europeans who landed here. The Dutch are probably still the most numerous, notwithstanding the exodus to the Orange River Free State, prompted by the slave question. Next in number are the English, by whom some parts of the country, particularly in the e., are occupied almost exclusively. The French are also largely represented, many refugees having settled in it subsequently to the revocation of the edict of Nantes, but they are now nearly absorbed in the Dutch population. They were at first located principally in the w., where they introduced the culture of the vine, but their names are now found in almost every part of the land. There is also a considerable importation of Germans, who have been settled on the frontiers adjoining the Kaffirs for defensive purposes. As regards the colored inhabitants, large numbers of Kaffirs have been retained in the districts which they formerly occupied, and others have come into the country as shepherds and servants. There is a large number of people of Malay origin in and around Cape Town, and in towns on the e. coast, who gain a livelihood as fishermen, porters, and the more laborious sorts of skilled labor. There are a few Mozambiqueques and Hottentots, besides a number of half-castes, to whom the name of *Africander* properly belongs.

The constitution of the country, after several changes, was fixed in its present form by an act passed by the colonial legislature in 1872, which provides for responsible government. There are two elective chambers, the upper house consisting of 23 members, elected for seven years. There are seven electorate provinces in the colony, and each chooses three members to the upper house. One is added for Griqualand West and one for Bechuanaland. They are presided over by the lord chief justice. To the lower house, or house of assembly, two representatives are appointed by each division of the colony, with the exception of the Cape district, which, as being more populous, returns four. They amount in all to 79, and are presided over by a speaker of their own choice. The governor carries on the administration along with a ministry of 5 members—the colonial secretary, the attorney-general, the treasurer-general, the commissioner of crown lands and public works, the secretary for native affairs. The supreme court, which has its sittings in Cape Town, has two judges beside the lord chief justice. Another court holds its sittings in Graham's Town, in which there are two judges only, but there lies an appeal to the supreme court. In other parts of the colony, justice is administered by the judges going on circuit. A colonial university has recently been founded.

Wool is the staple product of the colony; ostrich farming and the culture of the vine are carried on. The following tables show the exports and imports of the colony for recent years:

	Imports.	Exports.
1880.....	£8,078,048	£4,488,872
1888.....	7,013,885	8,964,449
1895.....	19,094,880	16,904,756

The Cape Colony is not exceptional in showing a decline in imports and exports in 1877; but the insecurity caused by the troubles ending in the Zulu war of 1879 has told against the prosperity of the colony. The official tables include in the returns of revenue also the loans raised by the government.

	Revenue.	Expenditure.
1875.....	£2,246,179	£2,272,275
1880.....	3,541,720	3,742,665
1888.....	3,427,609	3,285,512
1895.....	5,416,612	5,388,157

CAPE PALMAS, the s. extremity of Liberia, Africa, 4° 27' n., 7° 44' west. This was the point at which the Maryland colony of free colored emigrants settled in 1834. The surrounding country is one of the Liberian states, and is called Maryland. There is a light-house on the cape.

CAPE PRINCE OF WALES, in Behring sea, the w. point of the mainland of Alaska, directly opposite to East cape in Siberia, the strait between the two being the narrowest water between America and Asia. The cape is a few miles s. of the arctic circle, and terminates in a bold bluff, n. of which are dangerous shoals.

CAPE RACE, the s.e. point of Newfoundland, usually the first American land seen by steamers from England, 46° 40' n., 52° 54' west. There is a revolving light 150 ft. above the sea. The cape terminates in a bold rough headland.

CAPERCAILLIE, **WOOD-GROUSE**, or **COCK OF THE WOODS** (*tetrao urogallus*), the largest of the gallinaceous birds of Europe. It is a species of grouse (q.v.), almost equal in size to the turkey; the male, which is the largest, sometimes weighing fifteen pounds or more. In figure and appearance, it much resembles the black-cock, but the tail of the male C. is rounded, and not forked, as in that species; and the male C. has the feathers of the head elongated. The general color of the adult male is brownish black, minutely freckled with grayish white, and with lighter brown; the quill-feathers dark brown; the tail-feathers nearly black, some of the longer tail-coverts on the sides of the tail tipped with white; the chest is of a shining dark green; there is a small scarlet patch of naked skin above the eye, and the bill is whitish. The general color of the female and of young males is dark brown, freckled with yellowish brown; the front of the neck and the chest are yellowish chestnut; and the feathers of the under parts are generally edged with white. The C. has the feet feathered to the toes, but the toes are naked. It is an inhabitant of pine-woods; feeds on berries, seeds, worms, insects, etc., and on the young shoots of the pine, greatly preferring the Scotch fir to the spruce; occasionally also eating, at least in winter, the buds of the birch and other trees. The female makes her nest on the ground, and lays from six to twelve eggs, of a pale reddish or yellowish brown, spotted with other shades of brown, and more than 2 in. long. Like the black-cock, the C. is polygamous.—The geographical distribution of the C. is very extensive: it is found on the pine-covered mountains of all parts of Europe, from Spain and Italy almost to the North cape, and is abundant in the northern parts of Asia. It was at one time found both in Scotland and Ireland, but was completely extirpated about the end of the 18th or beginning of the 19th century. Through the exertions, however, of the earl of Fife and other proprietors of great Highland estates, but particularly of the marquis of Breadalbane, it has again been restored to the forests of the Highlands of Scotland. The C. is very capable of domestication, and breeds readily, if allowed the range of a space containing a few pine-trees. It is much esteemed for the table. The market of Stockholm is well supplied with it in winter; and since the establishment of steam communication, it has been regularly brought from Scandinavia to London.

CAPE RIVER, properly *Vaunks*, taking its popular name from the proximity of its mouth to cape Gracias a Dios, on the e. reach of the Mosquito shore in Central America. After a generally n.e. course of nearly 300 m., it enters the Caribbean sea, about lat. 14° 59' n., and long. 83° 11' w., being navigable for a considerable distance upwards.

CAPERNAÛM, meaning "the field of repentance," or "city of comfort," was in the time of our Savior a favorite and exalted city, and one of the three which he upbraided "because they repented not." It was situated on the north-western coast of the sea of Galilee, or lake of Gennesareth. It is now a heap of ruins, extending more than a mile along the shore and back towards the mountains, so overgrown with grass and bushes, that it is difficult to move among them. C. is called by the natives of Syria Tell-hûn.

CAPERS are the pickled flower-buds of the caper-bush (*capparis spinosa*). They have an agreeable pungency of taste, with a slight bitterness, and have long been in very general use as a condiment and ingredient of sauces, along with boiled mutton and other kinds of food. They possess medicinal properties, being antiscorbutic, stimulant, and laxative. They are of a grayish green color, to improve which, however, copper is sometimes used, as in the case of gherkins and other pickles, rendering them poisonous. This can be detected by thrusting a polished iron rod into the vessel which contains the C.; the surface of the rod soon becoming coated with copper, if it is present.—The caper-bush is a native of the s. of Europe, and other countries near the Mediterranean. It is extensively cultivated in some parts of the s. of France and in Italy, but most of all in Sicily. It succeeds in the open air even at Paris, but in Britain requires the aid of artificial heat. It is a trailing, rambling shrub, loving dry places, and often growing on rocks or walls, adding a fresh charm of beauty to many an ancient

ruin. It begins to flower early in summer, and continues flowering till winter. The buds are gathered every morning, and are immediately put into vinegar and salt: at the end of the season, they are sorted according to their size and color, the greenest and least expanded being the best, and are again put into vinegar, the finest being sent to the market in bottles, the coarser in small barrels. The fruit, which is a small berry, is also pickled in the s. of Italy. The flower-buds of the caper of Mount Sinai (*capparis Sinaica*) are pickled like those of the common species; the seeds are also pickled, and are called by a name signifying mountain pepper. The fruit of *capparis aphylla* is made into a pickle in India. Species of *capparis* are numerous in India, the warm parts of America, etc. See CAPPARIDÆÆ.—Various substitutes for C. are sometimes used, as the flower-buds of the marsh marigold (*caltha palustris*), those of the Indian cress (*tropæolum majus*), and those of the bean caper (*zygophyllum fabago*). The cape tree (*Capparis Jamaicensis*), which grows throughout the West Indies, in South America, and in Florida, is a small tree with a very hard wood.

CAPERS, WILLIAM, D.D., 1790-1855; a Methodist minister of South Carolina, in early life a missionary among the Indians in Georgia. He was for several years presiding elder in Charleston, where he edited the *Wesleyan Journal*, afterwards merged in *Zion's Herald*, and still later changed to the *Christian Advocate and Journal*, of New York. In 1838, he was representative to the Wesleyan conference in England, and in 1855 was chosen professor of the evidences of Christianity in the South Carolina university. In 1846, he was elected bishop, and filled the office until his death.

CAPE SABLE, the s. point of the mainland of Florida, and the s.e. extremity of the mainland of the United States, 26° 55' n., 81° 15' west.

CAPE SABLE, the s. point of Nova Scotia, 43° 26' n., 66° 38' west. There is a light on Cape Sable island, which island has a pop. of about 600 fishermen.

CAPE SAN LUCAS, the s. point of the peninsula of Lower California, 23° 44' n., 109° 54' west. Directly e. across the gulf is the Mexican port and city of Mazatlan.

CAPE SAN ROQUE, in n.e. Brazil, in the province of Rio Grande, 5° 28' s., 35° 10' west. Behind the cape is a bay, on which is the town of St. Joseph.

CAPE SPARTIVENTO, in s. Italy, in the Mediterranean, 37° 57' n., 16° 5' east. The ancients called it "Herculis Promontorium," and supposed it to be the most southerly point of Italy.

CAPE ST. VINCENT, a headland forming the s.w. extremity of Portugal, in lat. 37° 2' n., long. 9° w., is celebrated on account of two naval battles in which British ships were engaged, fought off it, one in 1693, the other in 1797. In the former, admiral Rooke, who with some 20 English and Dutch men-of-war was convoying a fleet of some 400 merchantmen, was attacked off this point by the French admiral De Tourville, and after a running fight lost several ships and 80 merchantmen. In Feb. 1797, sir John Jervis, with a fleet of 15 sail, gave battle to a Spanish fleet of 27 sail of the line, and defeated them, capturing four ships and driving the rest into Cadiz bay, where they were blockaded.

CAPE ST. VINCENT, a promontory on the east coast of Terra del Fuego.

CAPETIAN DYNASTY, the third Frankish dynasty, founded about the close of the 10th c., when Hugo Capet ascended the throne. The surname CAPET has been derived from *cappetus*, "a monk's hood," because, though duke of France, Hugo was also abbot of St. Martin de Tours. On the death of the last Carolingian monarch (Louis V., surnamed *Le Fainéant*—i.e., the Slothful), Hugo, the most powerful of French vassals, seized the throne, and by moderation and prudent concessions made to the authorities of the church, as well as to his brother-nobles, who had made themselves independent, contrived to retain the power he had seized. He was crowned at Noyon, July 3, 987. In order to establish his dynasty, Hugo caused his eldest son Robert to be crowned as co-regent, 988. Capet first made Paris the capital of France. He died in 996; when his son Robert, a well-disposed but feeble ruler, ascended the throne, who died 1031, beloved by his domestics, but despised by his neighbors and vassals, forgotten by his people, and permitting all power to vanish from his hands. It was during his long lethargic reign that the towns and cities of France began to form themselves into corporations, to act in their own name, to contract obligations, and lay the foundations of middle-class freedom. In many other ways, also, the happy dissolution of royal power sowed the seeds of national prosperity. Robert's sons were Henry, who succeeded him, and Robert, ancestor of the older house of Burgundy.

Henry left two sons—Philippe I., who ascended the throne, and Hugo, who distinguished himself in the first crusade (1096), and died 1102. Philippe, under the regency of Baldwin, count of Flanders, came to the throne when only eight years old, and first really began to reign after the death of the regent (1066). He took hardly any part in the great movements and events of his times, but supported Robert, son of William the conqueror, in his rebellion against his father. Consequently, William commenced an expedition against Paris, and would probably have dethroned Philippe, but died in

1089. By his dissolute course of life, Philippe fell under a sentence of excommunication issued by pope Gregory VII. in 1094, and, after doing penance, died in 1108.

His successor, Louis VI., surnamed le Gros, had, during Philippe's lifetime, been active in the support of the crown, and now extended the royal power, which had been almost entirely confined within the duchy of Paris. By bold and vigorous measures he brought everywhere his vassals into real subjection to his authority, liberated the towns from baronial oppression, partly abolished feudal bondage, and extended considerably the jurisdiction of the crown. His life was an almost incessant contest with the small and turbulent vassals who had rioted in the license afforded them by the weakness of his predecessors. He died 1137, leaving a numerous family.

As his eldest son and co-regent, Philippe, had died during the reign of Louis, his second son, Louis VII., le Jeune, now came to the throne, and by his marriage with Eleanor of Guienne, heiress of the duke of Aquitaine, gained a considerable accession to the power of the crown. He engaged in the second crusade, and led 100,000 men to the east; but was unsuccessful, and returned to France after an absence of two years. In 1152, he divorced his unfaithful wife Eleanor, who subsequently married Henry Plantagenet, afterwards Henry II. of England. This marriage made Henry far more powerful than the king of France, and Louis would probably have lost his crown had not the disturbances in England—the quarrels with Becket and with his own sons—proved sufficient to occupy Henry's attention. Louis le Jeune died 1180.

Philippe Auguste (q.v.), his son by a third marriage, ascended the throne ten months before his father's death, and proved himself the most able ruler of the Capetian dynasty. Against the wishes of his family, he married Isabelle of Hainault, great-granddaughter of the last of the Carolingians, and thus finally united the two houses. His successor, Louis VIII., who died 1226, was said to have been poisoned by the count of Champagne, paramour of the queen, Blanca of Castile. Louis VIII. was followed by his son, Louis IX. (SAINT LOUIS, q.v.), who died at Tunis, 1270. Of the eleven children of St. Louis, the eldest, Louis, died aged 16 years, while the youngest, Robert, became the founder of the Bourbon dynasty (see **BOURBON**). The second son Philippe III., le Hardi, succeeded his father, and, by the decease of two brothers and two uncles, acquired possession of Poitou, Auvergne, and Toulouse. His son (Philippe IV., le Bel), acquired by marriage Champagne with Navarre. These acquisitions, and his attempt to secure for his uncle, Charles of Anjou, the throne of Naples, involved Philippe III. in contentions with Italy and Spain. He subjugated Navarre, 1276, and died of the plague in 1285. Philippe IV., le Bel, succeeded to the throne when 17 years old. He soon gave signs of a despotic character, plundered the estates of the church, defied papal authority, persecuted the order of Templars (q.v.), and removed the residence of the pope to Avignon. The atrocious act of burning the grand-master, with sixty knights, of the order of Templars, after they had recalled all the confessions drawn from them by torture, has left an ineffaceable blot on the name of Philippe le Bel. He died 1314, and left three sons and a daughter.

The eldest son, Louis X., le Hutin, who ascended the throne, displayed remarkable weakness of character, and died 1316. He was succeeded by Philippe V., le Long, second son of Philippe le Bel, who died without issue. By his death (1322) the crown came to Charles IV., le Bel, third son of Philippe le Bel, and the last of the direct line of the Capetian kings. He died 1328, leaving by his third marriage a daughter, named Blanche, who married Philippe, duke of Orleans, and died (1392) leaving no issue. Isabelle (daughter of Philippe le Bel) married Edward II. of England, and was mother of Edward III., who consequently took the title of king of France, which was retained by the kings of England until the reign of George III.; but Philippe of Valois, cousin of the last Capetian king, and grandson of Philippe III., le Hardi, claimed the crown of France by virtue of the Salic law, and so founded the dynasty of Valois (q.v.).

CAPE TITMOUSE, *Rarus capensis*, a small bird of the cape of Good Hope, remarkable for its curious nest, which is built of cotton or other fiber in the form of a bottle, and suspended from the limb of a tree. On the outside, near the opening, is built a pouch or pocket, in which the male bird rests while the female is on the nest, and when she leaves he manages by strokes of his wings to close the mouth of the nest, to prevent intrusion while they are in search of food.

CAPE TOWN, the capital of Cape Colony, faces Table bay to the n.e., is flanked by the mountain Lion's Head, with its continuation to Lion's Rump or Signal Hill, and has behind it the precipices of Table Mountain. Its lat. is 33° 56' s., its long. 18° 28' 7" east. Its mean temperature 58.3° F. for winter, 76.6° for summer, and 67.3° for the whole year. Pop. '91, with suburbs, 83,718. Two lines of passenger wagons connect it with the diamond fields, which are reached in about a week, railways with Worcester, etc., and electric telegraphs with the principal parts of the colony. It is the principal port for the coasting trade as well as foreign exports and imports, is well supplied with fish, as well as meat, dairy produce, and every sort of fruit and vegetables, at a moderate price. It has a supply of fresh water of excellent quality. C. T. is the seat of the government, the supreme court, and a college and university, a public library and museum, and an observatory. All the churches are well represented—the English Episcopal, the Roman Catholic, and representatives of Presbyterians, Lutherans, Wesleyans, Congregationalists, a Free church (chiefly an off-break from the Dutch church), a Jewish

synagogue, and a Mohammedan mosque, the Malay population being of that faith. There are also banks and insurance offices. The town is built upon a double slope, which subsides into a plain on the n.e. side. Its streets, at right angles to each other, are lined with houses, for the most part of an eastern type, with heavy walls, flat roofs, and large public apartments, interspersed with increasing numbers of shops and warehouses, of the sort to be met with in England.

The most remarkable structures are the breakwater, with the docks and patent slip; the castle, with its outworks and bastions; the barracks for the military, the Roman Catholic cathedral, with a few other places of worship; the museum and library, with the Botanic gardens in front; and between it and Government house, a park, with its avenues shaded by stately oaks. Out of town, a little distance to the n.w., is Somerset hospital, and the Royal observatory, about two and a half m. to the n.e.

Along the shores of Table bay there are modern defensive works, including a line of forts, some of which are equipped with heavy ordnance.

CAPE TRAFALGAR. See TRAFALGAR.

CAPE VERD, the most westerly headland in Africa, jutting out into the Atlantic ocean, between the rivers Gambia and Senegal, in lat. $14^{\circ} 43'$ n., long. $17^{\circ} 34'$ west. It was discovered by the Portuguese about 1445, and is said to have derived its name from a group of gigantic baobab trees which adorns its summit.

CAPE VERD ISLANDS (*Ilhas Verdes*), a group of islands belonging to Portugal, lying in lat. $14^{\circ} 45'$ to $17^{\circ} 19'$ n., and long. $22^{\circ} 45'$ to $25^{\circ} 25'$ w., and distant about 320 m. w. of the cape from which they take their name. The principal islands are ten—viz., Santiago, the largest and most important, Fogo, Brava, Maio, Boavista, San Nicolão, San Antonio, San Vicente, San Luzia, and Sal. There are besides four islets, barren and uninhabited. The total area is about 1650 sq. m., with a pop. (1885) of 110,930. The islands are all very mountainous, and owe their origin to the action of submarine volcanoes. The highest elevation is reached in a volcanic peak, 9,157 ft. above the sea, on the island of Fogo, which is still active. The dry season extends from December to July; the rainy from August to September. The islands are occasionally visited by severe droughts, for the trade winds do not cause rain there. The climate is unhealthful during the rainy season. In spite of the drought the vegetation is luxuriant, yielding African and Southern European products. Sugar, cotton, coffee, tobacco, and indigo are grown, but the principal exports are *Jatropha curcas*, salt, corals, coffee, sugar, skins, brandy, Indian corn, beans, oranges, grapes, peanuts, cotton, and tobacco. Several of the European domestic animals thrive well. Turtles are abundant in the surrounding seas, and whales also are fished by British and American vessels. Amber is found on the coasts, and great quantities of salt formed by solar evaporation is obtained from the lagoons on the shores, especially on the island of Sal. The inhabitants, who are mostly negroes, indolent but harmless, speak a corrupted form of Portuguese, called *Lingua Creoula*. The revenue for 1894-5 was estimated at 259,170 milreis, and the expenditure for the same year at \$265,757. The islands are under a governor-general, exercising both civil and military authority. The chief ports are Porto Praya, on the island of Santiago, and Porto Grande, the best harbor in the whole group, on the island of San Vicente. The islands were discovered about the middle of the 15th c. by the Portuguese, who shortly after colonized them.

CAPE VINCENT, a village and port of entry in Jefferson co., N. Y., on the St. Lawrence river and the Rome, Watertown, and Ogdensburg railroad; 25 m. n.w. of Watertown. It is connected with Kingston, Canada, by ferry, and in 1896 had imports valued at \$213,185, and exports, \$79,401. Pop. '90, 1324.

CAPE WRATH, a pyramidal promontory of unrivaled wildness and grandeur, forming the n.w. extremity of Scotland and of Sutherland, and running out into the Atlantic, in lat. $58^{\circ} 38'$ n., and long. $4^{\circ} 58' 5''$ west. C. W. is 600 ft. high.

CAPIAS (Latin, "you may take," or "seize"), a writ in a civil action ordering the officer to whom it is entrusted to seize and take into custody the person of the defendant. Strictly speaking, a *capias* issues only in a common law, as distinguished from an equity proceeding. The abolition of imprisonment for debt has greatly diminished the number of cases in which the defendant may be arrested in a civil action, but the right of an arrest in almost all, if not all, of the states still exists where a wilful and malicious injury or a fraudulent concealment of property, or proposed evasion of the jurisdiction of the court, is alleged. Usually an affidavit must be presented on which to base the application for a writ of *capias*. Of the several kinds of this writ the most common are: 1. The *capias ad respondendum*, which directs the sheriff to arrest the defendant and hold him until a certain day at which he is to be brought before the court. Formerly this writ began every action at law; now the cases in which the arrest may be made are limited and defined by the statutes of the states. When used alone the word *capias* usually refers to this form of writ; 2. *Capias ad satisfaciendum*, a writ directing the officer to seize the party to the suit named (this may possibly be a plaintiff, though usually a defendant) and bring his body on a fixed day before the court to satisfy a judgment already issued. It will be seen that this was at the end, as the former writ described was at the beginning, of all law suits under the common law; though the use of

the writ is now much restricted by statutory limitations, it is still a common law process; it is familiarly known by the abbreviation *ca. sa.*; 3. *Testatum capias*, a supplementary or second writ, issued when an ordinary *capias* has been placed in the hands of the sheriff and has been returned with the endorsement that the defendant could not be found; in such cases the new writ may be issued after a lapse of time without the introduction of other proof than the producing of the original.

CAPILLARIES. The tubes which convey the blood from the left side of the heart to the various parts of the body are termed arteries, while those which return it to the right side of the heart, after it has discharged its various functions in the body, are known as veins. The name of capillary (from *capilla*, a hair) is given to the minute vessels which form the connection between the terminal branches of the arteries and the commencements of the trunks of the veins. These little vessels are of various sizes, some admitting only one blood-corpuscle at once, while others are large enough to allow of the simultaneous passage of two, three, or more corpuscles. In the muscular tissue their average diameter is 0.003 of a line; they are smallest in the brain, and largest in bone. Their arrangement varies in different parts. In some cases, as in muscular tissue, they run for the most part parallel to one another; in other cases (as around fat-cells) they have a spherical arrangement, and in the skin and in parts of the intestines they form loops; and many other forms of distribution might be mentioned. These various arrangements have been discovered by the microscopic examination of tissues that have been successfully injected with colored fluids.

The circulation of the blood through the C. may be readily seen in the web between the toes of the hind-foot of the frog, in the tongue of that animal, in the tail or gills of the tadpole, in the wing of the bat, etc. See DIGESTION; SECRETION.

CAPILLARY ACTION. When a clean glass tube with a fine bore, open at both ends, is plunged into a liquid capable of wetting it, such as water, the liquid is found (1) to rise in the tube above the level of its surface in the vessel containing it; (2) to rise the higher in the tube above that level the finer its bore is; (3) to stand above the general level in the tube where it approaches the sides (as in fig. 1, which is drawn on a greatly exaggerated scale), so that its upper surface in the tube is curved and concave. When a similar tube is plunged into a liquid incapable of wetting it, such as mercury, phenomena of a precisely opposite nature are presented. The liquid stands in the tube below the level of its surface in the vessel; and, where it approaches the sides of the tube, it stands below its general level in the tube, so that its upper surface is curved and convex as in fig. 2, the convexity and depression in the tube increasing with the fineness of its bore. While such is the case with the two classes of liquids described, there are others on which fine tubes have no action, so that they stand in such tubes

Fig. 1.

Fig. 2.

at the same level as in the vessel, and with plane upper surfaces. These are the leading phenomena to be explained by what is called C. A., the tubes with fine hair-like bores being called capillary tubes, from Lat. *capillus*, a hair. The phenomena, however, though connected by name with such tubes, are not dependent on them, but may be produced without their intervention by any contrivance which gives room for the so-called capillary action. For instance, if two plates of glass with parallel faces be placed together with two of their edges in contact, and the two opposite be separated a very little by a fine wedge; and then if they be put standing with their common edge vertical in a trough (fig. 3), containing a little colored fluid capable of wetting the glass, the fluid will rise between the plates, the height attained at any point being inversely as the distance between the plates at that point, so that its upper surface will be a curve of the kind known as the hyperbola—being highest near the common edge, and lowest near the edges separated by the wedge. If the same apparatus be placed in a trough containing mercury, the mercury will be depressed between the plates till its upper surface forms a hyperbola convex to the zenith.

Fig. 3.

To understand the peculiar action producing these phenomena, it must be kept in view that the surface of a fluid at rest under gravity is a horizontal plane (see HYDROSTATICS), and that this plane is maintained by gravity and the mutual attractions of the particles of the fluid mass. Suppose now a fluid at rest in a vessel to have a foreign body, such as a capillary tube, suddenly plunged into it, and separating, as by walls, a portion of the fluid from the rest. By cohesion (q.v.), the fluid particles inside the tube will be held on—drawn downwards—to the mass of the fluid, while by adhesion (q.v.) they will be drawn upwards towards the sides of the tube. By the ordinary action of gravity, as in tubes of a large size, the fluid will at once tend to rise in the tube to its level in the vessel. Whether it will succeed in doing so, or whether it will rise still higher, must depend on the adjustment of the forces of cohesion between the fluid particles and their

adhesion to the solid of the tube. The relation of these forces may be generally explained as follows: Let mm' (fig. 4) be the surface of the column, mn , of a liquid contained in a space, $abb'a'$, above or below the surface, nn' , of the external liquid. There being equilibrium between the liquid in the tube and in the vessel, any line of liquid particles may be taken and supposed to be detached from the rest and inclosed in a tube, without altering the forces exerted. Let the line included between the dotted lines be conceived so detached. The actions which the particles of the liquid in the tube exert on each other, or sustain from the sides of the tube, have no tendency to make the liquid move either up or down. But the column, mb , in the tube has some action exerted on it by the sides of the tube above the surface, mm' . Let A , depending on the force of adhesion, represent this upward action of the tube. The column is also attracted downwards by the detached column bc , i.e., by the liquid in the imaginary tube. Let C , depending on the force of cohesion, represent this downward action of the liquid. Also the part bc of the liquid is attracted upwards by the tube ab by the attraction which we have represented by A . Thus the liquid column is acted on by two upward actions $=2A$, and a downward action, C . The whole force acting on it, excluding gravity, is $2A - C$. Gravity would make the liquid rise to nn' at once, i.e., till it stood as high in the tube as in the vessel. Whether, then, it will rise above nn' , or be depressed below it, must depend on whether $2A$ is greater than C , equal to it, or less than it. If $2A = C$, the liquid will stand in the tube at the level nn' , as if these forces did not act at all. If $2A > C$, then $2A - C$ will be an upward force, and the column will be raised above the level nn' . If $2A < C$, then $2A - C$ will be a downward force, and the column be depressed.

Fig. 4.

Regarding the forms of the upper surfaces of columns of liquid in capillary tubes, it can be demonstrated mathematically that the same relations of the forces of attraction and cohesion which determine the elevation or depression of the liquid column, determine also the form of its upper surface in the two cases of elevation and depression. In fact, the case of the elevated column resembles that of a cylinder of any very elastic substance (so elastic as to suffer change of form very readily under pressure), supported wholly by the rim at one of its ends; or, what is the same thing, by vertical forces acting in the lines composing its outer surface. Gravity draws down the concentric shells, of which the cylinder may be conceived to be composed, the further the more remote they are from the outermost, or that which is directly supported, the central rod being the most depressed. It would appear that the form of the surface has an important bearing on the cause of the production of the whole phenomena.

The third fact of observation—viz., that the liquid rises higher or is more depressed the finer the bore of the tube—is thus explained in the case of elevation: Since, the action of adhesion is confined to the superficial layer of the fluid, and between the same substances is, *ceteris paribus*, constant in quantity for an equal extent of surface, the wider the tube the shorter must be the column sustained, as the contents of the column raised by cohesion increase more rapidly when the bore increases than the attracting surface. The column increases with the square of the diameter of the tube, while the attracting surface increases only with the diameter. The height, therefore, is inversely as the breadth of the tube. That the depression must increase as the bore of the tube diminishes, appears from reasoning similar to that employed in the case just discussed.

The degree of elevation varies with the nature of the fluid, the variation depending partly on the difference of cohesion between the particles of the fluid, and partly on the difference of adhesion between the fluid and glass. It is found that temperature affects these forces, so that the height diminishes as the temperature rises.

The depression of mercury in a fine glass tube makes it necessary to use a correction in reading off the height of the mercurial column in the barometer, which, owing to it, stands always a little lower than the height due to the atmospheric pressure. Experience, however, has shown that the capillary depression is nearly one half less in tubes which have had the mercury boiled within them than in unboiled tubes, as by the boiling a film of air, which in unboiled tubes adheres to the glass, is expelled. By widening the bore of the tube also, the error may be diminished so as to be neglected altogether. In a tube of $\frac{1}{4}$ in. in diameter, in which the mercury has been boiled, the depression is 0.02 in., while with a similar tube of $\frac{1}{2}$ in. diameter it is only 0.003. The depression of mercury, it is found, is slightly increased by an elevation of temperature. It may be mentioned that in reading off the level of mercury in any instrument, such as the barometer, the height should be taken from the convexity of the curve. If the liquid used in the instrument, however, wets the tube, the height should be taken from the concavity.

As already stated, the phenomena are not dependent on the intervention of tubes; any capillary cavity suffices to produce them. When two light bodies, such as two bits of cork, are left to float on water, near each other, they soon come together, moving at last with a rush. This is sometimes given as an example of the gravitation that draws

the planets to the sun; but it is really owing to this capillary action that we are considering. When the liquid wets the floating bodies, it rises slightly all round them, and this sustained liquid hangs as a weight on them on all sides. So long as it rises equally there is no motion; but when the bodies come near each other, the space between them becomes like part of the inside of a capillary tube, the water rises higher there than on the other sides, and the bodies move towards the sides that are most strongly pulled. When the floating bodies are not wetted by the liquid, the surface between the two bodies is depressed, as that of mercury is inside a glass tube, and the bodies descend, as it were, down the opposing slopes, and meet in the bottom of the hollow. If one of two bodies floating on water is smeared with oil so as to prevent the water from adhering, instead of coming together, the two will recede from each other, for reasons analogous to the above.

C. A. plays a most important part in nature in a great variety of ways. An instance of its employment by man is seen in the wicks of lamps and candles, which, being composed of fibrous materials, furnish hair-like channels by which the melted oil is elevated to the flame, and supplied as fast as it is consumed. C. A. influences the circulation of fluids in the porous tissues of animals, and it is the principal mode in which water, with the various substances which it holds in solution, is supplied to the roots of growing plants. It is through it that in summer droughts moisture is raised to the surface for the maintenance of vegetable life. C. A., too, affects many phenomena usually considered under the head DIFFUSION (q.v.) of fluids and gases. The reader, on referring to the article Osmose, will also see that it enters into the explanation of the phenomena known as exosmose and endosmose.

A familiar illustration of C. A. is furnished when one end of a towel happens to be left in a basin of water, while the other hangs over the side below the level of the water; the basin is soon emptied of its contents. It is important to observe that, although the towel will become wet, not a drop will flow from it, unless the outside end reach below the level of the water in the basin. In this respect C. A. resembles that of the siphon. And this shows the error of supposing that water may rise through the earth by C. A., and flow out as springs at a higher level than the source whence it is drawn.

Some very interesting experiments have been made by M. Poisenille (*Ann. de Chimie et de Phys.* III. xxi. 76) concerning the flow of liquids through capillary tubes, the results of which must here be stated. It appears that when the tube exceeds a certain length—which is greater as the bore increases—the following laws regulate the rate of efflux of the liquid, the efflux taking place under pressure: 1. The flow increases directly as the pressure, so that under double the pressure, double the amount is discharged in equal times. 2. In tubes of equal diameter, the quantities discharged vary inversely as the length of the tube. If a tube 2 in. long discharge 100 grains in 5 minutes, a tube 4 in. long will only discharge 50 grains. 3. In tubes of equal lengths, but different diameters, the flow is as the fourth power of the diameters. If one be $\frac{5}{16}$ of an inch in bore, and the other $\frac{1}{16}$, the efflux from the larger will be 16 times as great as from the smaller. It is further found that the efflux varies with the nature of the liquid, the material of the tube not appearing to affect the result in any great degree. No law of the rate of efflux has yet been discovered, depending on the density, capillarity, or fluidity of the fluids.

It may be mentioned, in conclusion, that the tubes to be used in the experiments on capillarity should be perfectly clean and dry. If wetted, the film of moisture on the tube forms a new tube, and the action will be the same as with a tube of the substance forming the film. The reader should consult Miller's *Elements of Chemistry*, and J. Clerk Maxwell's *Theory of Heat*, where the phenomena are treated from a different point of view; the phrases "superficial energy" and "superficial tension" being substituted for "capillarity," and the hypothesis of molecular attraction being avoided.

CAPISTRA'NO, GIOVANNI DI, 1386-1456; an Italian lawyer who became a Franciscan monk and a powerful and popular preacher. In 1450, the pope sent him to Germany to preach against the Hussites, and also to forward the projected crusade against the Turks, who threatened to overrun Europe. He failed to start the crusade, but in the siege of Belgrade he led the inhabitants with the cross in his hand in three successful sorties. He was canonized, and his tomb became a popular resort for pilgrims.

CAPITA, DISTRIBUTION PER—i.e., distribution by heads, or by numbers, equally—occurs in the case of several claimants to the property of a deceased person, all severally claiming in their own right, in equal degree of kindred, and not under any right of representation. See INHERITANCE, SUCCESSION.

CAPITAL (Lat. *capitulum*, from *caput*, the head), the head of a column, pilaster, etc. Till the period of the renaissance, the head of a column in English was called chapter (chapter), its diminutive being chapitrell. See COLUMN.

CAPITAL, in fortification, is an imaginary line dividing a defense-work into two similar and equal parts. The C. of a bastion is a right line drawn from the point or salient angle to the middle of the gorge or entrance in the rear. The C. of a ravelin is a right line drawn from the re-entering angle of the counterscarp to the salient angle of the ravelin.

CAPITAL, in geography, the principal city or town of a country, that in which the sovereign usually resides, and where the legislature meets, and the chief legal courts are held.

CAPITAL, in its restricted sense is the money, or the property convertible into money, with which a trader carries on his business. Adam Smith defined it as "that part of a man's stock which he expects to convert into revenue." In the wider sense in which the term is employed in political economy, it indicates wealth set apart for purposes of production. In this latter acceptation it is sometimes regarded as the produce of past labor stored up and applied to the maintenance of future labor. This view, however, is not altogether correct, because any body of wealth may be employed as capital, and wealth is not always the result of labor. Thus if a diamond be accidentally found and then sold by its possessor and its produce applied to production, capital has come into existence without further labor than was incidental to the picking up of the stone. Capital is the result of abstinence; its existence implies that the owner of a certain amount of wealth abstains from the unprofitable consumption of it in order to consume productively, that is in such a way that it shall reproduce itself. But if it reproduce no more than itself there would be no incentive to the possessor to abstain from the consumption of it in his own personal gratification. Consequently he expects a reward for his self-denial. This reward is termed interest, being the remuneration for the use of capital and arising from the fact that the owner foregoes an immediate gratification or surrenders to another an essential agent of production. Wherever something is withheld from immediate consumption, and made to serve in future production, there is capital.

An important fact in the history of capital in modern civilized countries, is its constant increase and the consequent lowering of the rate of interest. Capital is with land and labor a requisite in the production of wealth, for without some wealth stored up for the subsistence of labor, a community could never advance beyond the hand-to-mouth stage of production. In the older school of economists there was no distinction made between the capitalist and the entrepreneur or employer of labor. According to these economists, the capitalist received profits, including not only interest on capital, but compensation for risk and wages of superintendents. Modern writers consider the share of the capitalist merely as the interest on his capital and limit the term profits to the remuneration of the entrepreneur. Belief in the so-called antagonism between labor and capital has been fostered by the writings of the old economists, who held the view that a certain fixed fund, called the wage fund, was set apart by certain economic forces for the payment of labor, and that during a definite period this fund could not be increased. From this it appeared that the interest of the laborer was of necessity opposed to that of his capitalist employer. The demolition of the old wage fund theory and the establishment of the doctrine that wages are paid out of product has done much to remove the misapprehension concerning this hostility between the two factors of production.

Capital may be divided into three elements, subsistence, tools and material, the first of course being the primary and most essential. Another division is into fixed and circulating capital, the former being that which is tied up in plant, that is, buildings, machinery, etc., and the latter being that portion which is turned over in the course of trade, as in the payment of wages and in the purchase of goods which are soon to be sold again. The concentration of a large amount of fixed capital is one of the reasons which obstructs the operation of the law that capital flows into its most productive channel, for it is obvious that wealth of this sort cannot be readily applied to other purposes and that its owner will prefer to go on selling for a time at a loss rather than to sacrifice his property by suddenly throwing his plant upon the market.

The concentration of capital in the hands of the few is a characteristic of the present industrial system. Its advantages are: First, the cheapening of production by preventing the multiplication of machines and other facilities for industry; Second, the extension of the division of labor, the large business being able to organize its forces and find a place for its workmen each according to his abilities more effectively than the small business; Third, the prevention of wasteful competition through diminution in the number of the controllers of capital. On the other hand it tends to reduce the conductor of a small business to the position of a subordinate in a large establishment, thus depriving him of that personal interest in management which may lead to the practice of economy at the same time that it encourages a spirit of independence. Again the possessor of a large capital is often able to crush out weak competitors and there is danger lest, after ridding himself of his rivals, he will secure a monopoly price for his product. Looking at these obvious tendencies of the capitalistic system, the socialist proposes that all capital should be socialized, that is to say, administered for the benefit of the community as a whole. They point to this very concentration of capital as rendering the change from individual to social ownership an easy step to take, for, the number of owners tending constantly to diminish, there are fewer individuals to be sacrificed through the introduction of a socialistic system. Of the different socialistic theories of capital the most important is that of Carl Marx, the author of the exhaustive work, *Das Kapital*. Marx finds no other source of value than labor, and holds that it is through the unscrupulous exploitation of labor that the capitalist employer reaps his so-called profits. The force of unrestricted competition obliges the laborer to accept what terms he can obtain from the capitalist, who through combination with his fellows seeks always

to depress wages to the limit at which they will barely maintain the requisite labor-power. If six hours' work will produce enough to maintain this labor-power and the capitalist can oblige the laborer to work for ten, the four hours' work constitutes what Marx calls surplus labor value which is stolen or "expropriated" by the capitalist. Arguing in this way, Marx concludes with the advice, "Expropriate the expropriators." Modern economists differ wholly from this view of the origin of value, maintaining that labor is not the sole source, but that value arises in a subjective sense from utility, and in an objective sense through the law of supply and demand. Thus denying Marx's premise, they cannot admit the conclusion that remuneration for the use of capital is so much stolen from the product of labor.

For further discussion bearing on this subject, see the articles, INTEREST, WAGES, PROFITS, and POLITICAL ECONOMY.

CAPITAL ACCOUNT—such is the name given to what concerns the capital stock of a railway or other public company. In authorizing a railway company—which we take as an example—parliament gives power to raise so much money by shares, and so much by borrowing. The amount that may be borrowed is equal to a third of the share stock, but it cannot be legally borrowed until at least one half of the share stock has been paid up. The form of borrowing is that of giving a mortgage on the whole property of the railway; the deed of mortgage, which is called a debenture, expresses the sum lent, the rate of interest that is to be paid, and the period for which the loan is given. See DEBENTURE. Unitedly, the money got for shares and by debentures forms the capital of the company; and, deposited in a bank, constitutes the *capital account*. On this fund the directors of the company make draughts to pay for the land, and all the works connected with the line, as also rails, locomotives, carriages, and, in short, everything involved in perfecting the railway up to the point of working. From the first, the holders of debentures receive interest, which must be paid in all circumstances, and the principal must be returned at the conclusion of the period for which it has been borrowed; at least, such are the ordinary obligations towards debenture holders. For the share part of the capital no return is made till the railway has been in operation, and drawings come in from the traffic.

As soon as traffic commences, there begins a new account called the *revenue account*, and which, kept in the same or a different bank, has no connection with the capital account. This, it may be judged, at once introduces a great complexity into the financial affairs of railways. In ordinary businesses, the profits of a concern are the free proceeds after deducting interest on capital and all expenses; and no attempt is made to keep two accounts, or to detach one part of the revenue from the other. As shareholders in a railway occupy the position of partners in a business, it might be expected that they would receive a divisible part of the proceeds equal to their respective claims after all expenses whatsoever had been paid. This is not the plan usually adopted. In general, the shareholders are only temporary partners; they buy shares in order to sell them at an advance. What they mainly look to is the rise on shares in the market, and therefore any process of management which can promote this important object meets their approval. Hence, the keeping of two accounts, two bank pass-books, and two books of checks. From the revenue account are drawn all payments for wages, rates, and taxes, coke, oil, and other petty furnishings, also repairs on carriages and locomotives, maintenance of way, and general management. What remains is the fund, whence is paid, first, the interest on debentures, and second, the dividend of the shareholders. From the C. A. are drawn all other outlays: first, the repayment of principal to debenture holders, and, second, the expenditure for new carriages and locomotives, new rails, and other substantial repairs upon and additions to the plant. As all railway traffic exceeds the expectations formed respecting it, the demands on the C. A. for fresh additions of one kind or other become exceedingly onerous. Were the shareholders to look to ultimate advantages, they would sanction the payment for permanent improvements out of the current revenue; but, as has been stated, shareholders for the most part care nothing for the remote and contingent prosperity of the undertaking, and will not or cannot make a corresponding sacrifice. Greatly diminished by primary outlay, and now operated upon for all sorts of additions and improvements, the C. A. is at length exhausted, and new powers have to be got from parliament to create new shares and new debentures, and which shares are only taken up by being guaranteed a preferable claim on the funds of the company. Where a large extension of traffic must be provided for, the creation of fresh capital is indispensable and legitimate; but it is equally open to remark that the C. A., as usually conducted, affords the means of enormously increasing the company's obligations, and is, in fact, an expedient to give good dividends to present holders of stock at the cost of their successors. Perceiving what must be the consequences, those among the proprietary of the small and more prudently managed railways who look to permanent investment, lose no opportunity to urge "that the C. A. shall be closed, and the whole expenditure of the company, including the payment of dividends and interests, be taken from revenue." Objections are raised to these remonstrances, sometimes on plausible, sometimes on sufficiently valid, grounds;

and it may be said that in remarkably few cases have railway companies been able, or been disposed, to close their capital account. See RAILWAYS (Legislation and Management).

CAPITAL FELONIES. See CAPITAL PUNISHMENT; FELONY

CAPITAL PUNISHMENT in criminal jurisprudence is the punishment of death. It is called *capital* punishment because the head (Lat. *caput*), from being the most vital, is usually that part of the body which is acted on. This applies especially to beheading and hanging; but almost all modes of depriving a criminal of life appear to have in view the peculiar vulnerability, and, at the same time, vitality of the head. This extreme penalty, notwithstanding the practice of the world from the remotest times down to the present day, has frequently been reprobated by philosophers and philanthropists, who have even gone so far as to deny the right so to punish to any earthly power. The weight of authority, however, appears in favor of capital punishment. Mr. Bentham, one of the most reasonable and discriminating authorities on the subject, in his well-known and valuable treatise, says that the idea of C. P. would naturally suggest itself in the infancy of a state. When any one had committed an offense, and disturbed the peace of society, the question would then first arise: "How shall we prevent these things?" and the answer most likely to occur to a set of barbarians would be: "Extirpate the offender, and give yourself no further trouble about him." And in conformity with this view of the matter, he alludes in a note to the case of the Hottentots, who have no fixed laws to direct them in the distribution of justice, and consequently, when an offense has been committed, there is no form of trial, or proportion of punishments to offenses; but the kraal (village) is called together, the delinquent is placed in the midst, and, without further ceremony, demolished with their clubs, the chief striking the first blow. The marquis Beccaria, in his remarkable *Essay on Crimes and Punishments*, strongly argues against the capital sentence being carried out in any case, denying the right, in fact, of government so to punish, and maintaining, besides, that it is a less efficacious method of deterring others, than the continued example of a living culprit condemned, by laboring as a slave, to repair the injury he has done to society. Bentham, on the contrary, holds that death is regarded by most men as the greatest of all evils; and that especially among those who are attached to life by the ties of reputation, affection, enjoyment, hope, or fear, it appears to be a more efficacious punishment than any other. On the question of right, Beccaria is still more pointedly refuted by sir Samuel Romilly, who observed: "Beccaria and his disciples confess that it is not the greatest of evils, and recommend other punishments as being more severe and effectual, forgetting, undoubtedly, that if human tribunals have a right to inflict a severer punishment than death, they must have a right to inflict death itself" (*Memoirs*, vol. iii. p. 278). It is not a little interesting to know that such was the opinion of one who did so much as a statesman to mitigate the severity of the criminal law.

Against C. P. arguments are often urged from Scripture, based on the general principle of Christian charity. To these it is replied that they proceed on a misapprehension and misapplication of the principle; and reference is confidently made to the Old Testament as sufficiently exhibiting the mind of the great Lawgiver in regard to this matter.

Death was, in former times in England, the ordinary punishment for all felonies, and the certain doom of those who could not avail themselves of *benefit of clergy* (q.v.), i.e., the common law inflicted death on every felon *who could not read*, and the law implied that punishment, where a statute made any new offense felony. On the other hand, the numerous acts of parliament creating felonies without benefit of clergy, show that the statute law was still more sanguinary, so that of the 160 offenses referred to by Blackstone as punishable with death, four fifths had been made so during the reign of the first three Georges. That some idea may be formed of such Draconian justice as was then established, we may mention the following as among the offenses which involved sentence of death: stealing in a dwelling house to the amount of 40s.; stealing privately in a shop goods of the value of 5s.; counterfeiting the stamps that were used for the sale of *perfumery*; and doing the same with the stamps used for the certificates for *hair powder*. Thanks, however, to the exertions of sir Samuel Romilly, the inhumanity and impolicy of such a state of the criminal code gave way, towards the end of the reign of George III., to a course of legislation which has reduced the application of death as a punishment within its present humane limits. Practically, indeed, it is only in the case of treason and murder that the capital sentence is ever pronounced; and even then, it is not always carried out, for the crown reserves to itself and exercises a right of review which frequently leads to such a change in the convict's fate as at least spares his life. This discretionary control on the part of the executive is essential in the present state of the law, which affords no means for a judicial appeal on the merits; for the very nature of the punishment, when finally executed, precludes the idea of all benefit to the sufferer, should the verdict of the jury afterwards turn out erroneous, and the innocence, instead of the guilt, of the accused be established. The law as it stands, indeed, allows a capital sentence to be reversed if technical error can be shown on the

face of the judgment or other matter of record—but what avails that, after the sentence has been executed.

With respect to the mode of executing C. P., we need not detain the reader by any account of the obsolete cruelties and tortures of former times. It may suffice to state that *hanging* and *beheading* are the two methods which now, for the most part, are practiced in the different European states—indeed, with the exception of Spain, by all. In the last country, the death of the culprit is instantaneously caused by the *garrotte* (q.v.). In England, Scotland, and Ireland, and in all the dependencies of the crown, the convict is hanged; while in France he is decapitated by the *guillotine* (q.v.), an instrument which an old Scotch machine called the *maiden* (q.v.), and used for the same purpose, very much resembled. In most of the German states, beheading is the mode of execution adopted; but in Austria, criminals convicted of capital offenses are hanged, as in England. See EXECUTION, MILITARY AND NAVAL.

In Holland there have been no executions since 1860, and C. P. was totally abolished in 1870. In Roumania it was abolished in 1864, and Portugal has adopted the same course. In Belgium the punishment of death is practically abolished, and no execution has taken place since 1863. Switzerland abolished C. P. in 1874, but murders increased, and in 1879 the cantons recovered by law the right of re-establishing it in their respective territories. It remains, however, totally abolished in 15 cantons. In Austria, during the period 1870–79, of the 806 persons sentenced to death, only 16 were executed. In Sweden during the same period only 3 out of 32 sentenced were executed; in Denmark only one out of 94; in Bavaria, out of 249 committed for murder, only 7 were executed. In North Germany, during the period 1869–78, 1301 persons were convicted of homicidal crime, and 484 sentenced, but only one was executed—Hödel, who attempted the assassination of the emperor William. From these instances it will be seen that in many European countries in which the extreme penalty is still enforced, the law has been practically abrogated by the marked growth of more humanitarian sentiments. See ELECTRICITY, DEATH CURRENT OF.

In our own country, capital punishment under the laws of the United States may be inflicted for treason, murder, arson, rape, piracy, robbery of the mails with jeopardy to the lives of persons in charge, rescue of a convict going to execution, burning a vessel of war, and corruptly destroying a private vessel. Until within a few years C. P. was the rule for the highest crimes in all the states, but it was abolished in Wisconsin and in Maine in 1874, and had been about that time abolished in Iowa; but in the latter state it was restored in 1878, the argument showing from the record that during its abolition crimes of violence had largely increased. Under the present law, a year must intervene between the sentence and execution, and the term may be further extended by reprieve. It was abolished in Michigan, Rhode Island, and New York also, but the last-named state was compelled to restore it, and in 1888 passed a law substituting death by electricity for hanging, a measure likely to be adopted by other states. By this method, the electric current, which must approximately equal in strength the currents used for the more powerful kinds of electric lights, is passed through the body of the criminal between suitable electrodes or wires attached to the head and back. It has been found that in this way death is produced instantaneously; probably too quickly for the nervous system to convey any impression of pain to the brain. This fact leaves room for the objection that punishment by this method would not be as potent to prevent crime as more severe measures. By the New York law no notice of the time of execution shall be publicly given except to persons invited or permitted to be present; said persons consisting of not more than 2 ministers or priests named by the criminal and 7 assistants or deputy sheriffs appointed by the agent and warden. Immediately after the execution a post-mortem examination shall be made by the physicians present at the execution. No religious services shall be held over the remains, except within the walls of the prison, and only the prison officers, the person conducting said service, and the immediate family and relatives of said deceased prisoner shall be present. No account of the details, beyond the statement that such convict was on the day in question duly executed, according to law, at the prison, shall be published in any newspaper. The first execution under this law, was that of William Kemmler, at Auburn Prison, Aug. 6, 1890.

As each state has jurisdiction over its own territory, the laws punishing crime differ in several respects. In many states, murder is by statute divided into different degrees, differing from each other by the malice and premeditation which accompany the act. In a few states imprisonment for life is substituted for C. P. As regards the U. S. army, the concurrence of two-thirds of a general court-martial is required, and no sentence of death can be carried out until confirmed by the president, save in persons convicted in time of war, as spies, mutineers, deserters, or murderers. The effect of the abolition of the death penalty has not thus far supplied any very strong reasons for the stand of those who would abolish it altogether. Perhaps the most notable suspension of this punishment in all history was during the civil war in the United States, when no person was deliberately executed for what was held to be treason against the federal government, and the extreme penalty visited even upon the captured head of the confederate government was the loss of the political (but not the personal) rights of a citizen.

CAPITALS (*majuscula*), in contradistinction to small letters (*minuscule*), are the large letters employed in writing and printing to help the eye, to relieve the uniformity of the page, to increase the facility of keeping and finding the place, to mark the beginnings of sentences, proper names, etc. Among the ancients, and during the earlier part of the middle ages, no distinction of C. and small letters was known; and after the practice had been introduced of beginning books and chapters with great letters often adorned or illustrated with much artistic ability, it was long before C. were employed in such a way as could afford much real advantage to the reader. At the present day, they are universally employed, even in the printing of Greek and Latin books. Considerable diversity has existed at different times with regard to the employment of them, the books of the 17th and 18th c. exhibiting a much greater proportion of them than those of the present day. In German books, all substantives usually begin with a capital letter; in English and French books of the present day, they in general appear only at the beginnings of sentences and of proper names. Adjectives formed from proper names, as *English*, *French*, etc., are generally begun with a capital in English books, but not in French nor in German ones.

CAPITANA' TA, or **FOGGIA**, a province of Italy, the *Daunia* of the ancients, is bounded n. and e. by the Adriatic, and on the s.w. by the Apennines. It stretches along the Adriatic about 70 m. in a straight line, and its average breadth is about 45 m.; but its coast-line, measuring round the great promontory of Monte Gargano, which has been called "the spur of Italy," is fully 100 m., and its breadth between the extremity of that projection and the Apennines, 75 miles. Pop. '95, 408,371. The greater part of the surface is a sandy plain sloping from the Apennines to the Adriatic, and watered only by some inconsiderable streams. The rearing and feeding of cattle form the chief occupations of the inhabitants. Wheat, wine, and fruits of various kinds are produced in quantities sufficient to admit of exportation. There are important salt-works, quarries of alabaster, and potters' clay. Foggia is the chief town.

CAPITATION, from the Latin *caput*, a head, means something applicable to all persons, or to the people by the head. A tax levied on all persons, without reference to property or other incidents, is called a C. tax, and sometimes a poll tax. The former term was often used in France for the tax better known as the *taille*, although this offensive impost was not imposed on all alike, the nobility enjoying many exemptions from it.

CAPITOL, the fortress of ancient Rome, and site of the national sanctuary the temple of Jupiter, was situated on the *Mons Capitolinus*, the smallest but most famous of the seven hills on which Rome was built. The hill itself was first termed *Mons Saturninus*, afterwards *Mons Tarpeius* and *Rupes Tarpeia*, and after the foundation of the capitol, *Mons Capitolinus*, though a particular portion of it retained its ancient name of *Rupes Tarpeia*. It was steep and abrupt in almost every part, formed a natural fortress, and was strengthened here and there by towers. The C. was founded by Tarquinius Priscus, and completed by Tarquinius Superbus, who tasked the people to work at it. The whole mount had a circumference of about 800 paces. During the civil wars under Sulla, the temple was burned (according to Tacitus, by design), and after its restoration, destroyed during the Vitellian riots. It was rebuilt by Vespasian, after whose death it was again destroyed by fire, but was once more restored by Domitian, who instituted here the capitoline games. Domitian's structure lasted to a late period of the empire. Regarding the site of the C., there has been great dispute; the German scholars, for the most part, maintaining that it occupied the s.w. summit of the hill, and the Italians, the n.e. The latter situation has the weight of probabilities in its favor. From that portion of the mount named the Tarpeian rock, state criminals were thrown down. According to the description given by Dionysius of Halicarnassus, the temple of Jupiter, with its peristyle of columns, was 200 ft. long by 185 ft. wide, and was divided into three cellæ, separated from each other by walls, and respectively dedicated to Jupiter, Juno, and Minerva. In the spacious portico, the people feasted on triumphal occasions. The scanty ruins remaining in the present day consist of a sub-structure of peperino or volcanic tufa, a wall of the same materials, and some remains of the s. front, together with a portion of the great flight of steps leading to the temple.

The modern C. (*Campidoglio*), built on the site, and partly on the foundation of the ancient C., was designed by Michael Angelo, but is one of his inferior works. The main entrance, however, presents a splendid view. It is used as a kind of hotel-de-ville and museum.

Besides the great temple of Jupiter, the most important structures on the Capitoline Mount were the temple of Jupiter Tonans, built by the emperor Augustus; and the magnificent *Tabularium*, containing archives, and, in connection with the *Ærarium* ("Treasury"), serving as a library and place for lectures, etc. The remains of this structure, built by Quintus Catulus, 73 B.C., have still an imposing aspect.—For the U. S. Capitol, see WASHINGTON.

CAPITOLINE GAMES, instituted 387 B.C., in commemoration of the preservation of the Roman capitol (fortress) from the Gauls. Nero revised them, modeled them after

the Olympian games, and proposed to institute a new computation of time founded upon the 5-year period intervening between the celebrations.

CAPITOLINE HILL. See **CAPITOL**.

CAPITOLINUS, JULIUS, a Latin historian of the 3d c., who wrote the lives of several of the Roman emperors, and was one of the authors of the *Historia Augusta*.

CAPITULARIES (Lat. *capitularia*). *Capitularium* is literally a book divided into chapters; and the plural of the word was the name given to the laws issued by the kings of the first and second of the Frankish races, from Charles Martel downwards. These laws proceeded from the great assemblies of the king, nobles, and bishops, which formed the states of the kingdom, and, from their general character, were opposed to the laws issued for the separate states, which were called *leges*. They were divided into general and special C., according to the more or less general nature of the interests which they embraced, and the mode of their publication. They have by no means been all preserved. The most famous are those of Charlemagne and of St. Louis. In 827, abbot Angenius, of Fontenelles, made a collection of the C. of Charlemagne, and of his son, Louis le Débonnaire. Other collections were made by private persons, and, in 847, one by authority of the king, but they are all very imperfect and ill arranged. After Charles the Simple, in 922, no more C. were issued, and no similar laws or statutes exist from that period till the time of Louis le Gros, in 1100. The best collections are those of Baluze (Paris, 1677 and 1780), and of Pertz, in the *Monumenta Germanie*.

CAPITULATION, a treaty consisting of several specified conditions (Lat. *capitula*, heads). In the military sense of the word, a C. is a treaty of surrender to an enemy. When a place can no longer be defended, on account of failure of ammunition or provisions, or the progress made by the besieging-party, a white flag is commonly put up, as a sign that the besieged are willing to capitulate. According to the kind and degree of peril in which the fortress is placed, so are the terms which the governor may reasonably expect from his successful opponent. Sometimes the arms and military stores are left to the besieged, but more frequently they are taken by the besiegers, except articles of private property belonging to the officers and men. The "honors of war," the marching out with drums beating and colors flying, are usually stipulated for, unless the conqueror exacts very severe terms. The mildest form of a C. is a *convention*, agreed to when the conqueror is not strong enough to insist on stringent conditions.

CAPNOMANCY, a word formed from the Greek *capnos*, smoke, and *manteia*, divination. The ancients practiced it in two different ways—either they threw grains of jasmine or poppy on the burning coals, and watched the motions and the density of the smoke that rose from them, or they watched the smoke of sacrifices. This latter kind of C. was most generally employed, and that to which the greatest importance was attached. If the smoke was thin, and ascended in a right line, instead of being blown back by the breeze, or spreading over the altar, the augury was good. It was also believed that the inhalation of the smoke rising from the victims or from the fire which consumed them, gifted the priests with prophetic inspiration.

CAPOBIANCO, the founder and leader of the Carbonari (q.v.), a secret society formed, in 1808-10, in Italy to oppose the rule of Murat and of Ferdinand. Very little is known of him, except that he was treacherously arrested and put to death.

CAPO DI MONTE was a china manufactory, situated near Naples, Italy. Articles were made in colored relief. It was in operation from 1736 to 1821. The marks and moulds are now used at La Doccia, near Florence. See **DOCCIA**.

CAPO D'ISTRIA, a fortified seaport t. of Austria, situated on a rocky island in the gulf of Trieste, 8 m. s.w. of the city of Trieste. It is capital of the circle of Istria, with the peninsula of which it is connected by a stone causeway. Pop. about 8200.

CAPO D'ISTRIA, or **CAPO D'ISTRIAS**, JOHN ANTHONY, Count, president of the Greek republic from 1827 to 1831, was b. in Corfu, 1776. His family had been settled in that island since the 14th c., but originally came from the Illyrian town of Capo d'Istria (q.v.), near Trieste. He devoted himself to political life, and after having held a high position in the Ionian islands, he entered the diplomatic service of Russia. Here his diplomacy tended to the separation of Greece from Turkey. In 1827, he was elected president of Greece; and in Jan., 1828, he landed in Greece, and entered upon the duties of his office. He was a patriot, a philanthropist, and an able diplomatist, but by no means equal to the task which he now undertook. Everything was in disorder; the people had been long enslaved, and knew not how to use their freedom; and the president had been so much imbued with the centralizing principles prevalent at the courts which he had frequented, that some of his measures, especially that restricting the liberty of the press, gave offense to the most temperate of the enlightened lovers of civil liberty. His career was cut short by his assassination in a church at Nauplia on Oct. 9, 1831. The assassins were relatives of Peter Mauromichali, against whom he was urging on a prosecution, for alleged offenses against the state.

CAP OF MAIN'TENANCE, or **DIGNITY**, is a cap worn by noble and royal personages on certain state occasions. Such a cap was sent by pope Julius II. to king Henry VIII., for writing his book against Martin Luther.

CAPONIERE, or **CAPONNIERE**, in fortification, is a parapet 8 or 10 ft. high, with a superior slope, terminating in a small glacis. It is placed in the ditch of a fortified place, to cover or screen the defenders while passing from one defense-work to another. Generally, it has a banquette, on which musketeers may stand to fire over the crest. If there is a passage between two such parapets, it is a *full caponniere*; if on one side only, a *half caponniere*. See **CASEMATE**.

CAPPA, CARLO ALBERTO, musician, born in Alessandria, Sardinia, 1834. His father was an officer in the army, and this gave the son the privilege of entering the Royal Academy of Music at Asti, when only ten years of age. At the age of fifteen, he became first trombone in a military band, and after six years, joined the band of the U. S. frigate *Congress*, where he soon became leader. In 1858, he went to New York; joined the Shelton band; followed its leader, Grafulla, when he became leader of the 7th regiment band in 1860, and became his successor in 1881. He conducted many concerts in different cities; and d. in 1893.

CAPOTE (Fr. *cape*, a cape, cloak), is a long cloak with a hood, worn in the s. of Europe by soldiers, sailors, and travelers. In the Levant, the capote is an outer garment, worn both by men and by women, and made either of rough cloth or of skins, retaining their hair. It is described as "a sort of white frock coat, without sleeves, and embroidered in bright colors down the seams.

CAPPADO'CIA, anciently a province, and subsequently a kingdom in the w. of Asia (in part the present Caramania). It was bounded by Lycaonia on the w., by Cilicia and Syria on the s., by Armenia on the e., and by Pontus on the north. During the time that it belonged to the Persian empire, however, it included Pontus, which was called Lesser Cappadocia. In 17 A.D., C. was erected into a separate province of the Roman empire by Tiberius.

CAPPARID'EE, or **CAPPARIDA'CEE**, a natural order of exogenous plants, allied to *cruciferae*, and including about 350 known species, herbaceous plants, shrubs, and trees, mostly natives of tropical and sub-tropical countries. The leaves are generally alternate, stalked, undivided, or palmate; the flowers solitary or clustered; the calyx of four sepals, sometimes cohering in a tube; the corolla of four, or sometimes eight petals, sometimes wanting, the stamens generally a multiple of four, or indefinitely numerous, placed on a hemispherical or elongated disk; the ovary one-celled, the style thread-like or wanting; the ovules curved; the fruit either dry and pod-like (tribe *cleomeae*), or a berry (tribe *cappareae*). To this order belongs the well-known caper-bush. See **CAPERS**.

CAPPE, NEWCOME, 1732-1800; an English dissenting clergyman who studied under Doddridge, and adhered to Dr. Priestley's Unitarian doctrine. He was pastor of a dissenting congregation in York for more than 40 years, and was one of the ablest and most eloquent of his denomination. He was also the author of a number of devotional works.

CAPPEL, a village of Switzerland, in the canton of Zurich, and 10 m. s.s.w. of the city of that name. It is interesting as the place where the great reformer Zwinglius was killed in a conflict with troops of the Roman Catholic cantons, Oct., 1531. A monument has been erected here to his memory.

CAPPEL, a French family of scholars, theologians, and lawyers. GUILLAUME, in 1491, had the boldness to refuse the payment of tithes demanded by the pope. JACQUES, his son, was counselor of state under Francis I., and in 1537 made a powerful speech against Charles V. LOUIS, son of Jacques, was professor of theology at Sedan, and more than once risked his life in the cause of Protestantism. One of his acts was to present to Charles IX. the confession of faith drawn up by the Protestants of Paris. Two others, a son and a grandson of Jacques, were distinguished, one in the law, and the other in theology, history, philology, and antiquities. Both these were named JACQUES; and the younger was the father of LOUIS, the most celebrated member of the family (1585-1658), who studied at Sedan, Oxford, and Saumur, and was professor of Hebrew at the latter place. He devoted much attention to the text of the Scriptures. On the revocation of the edict of Nantes, Louis fled to England where he died. His life was published by his nephew, JAMES, who at only 19 years of age was professor of Hebrew at Saumur.

CAPRA'RA, GIOVANNI BATTISTA, 1733-1810; an Italian statesman and bishop, who served as papal legate or nuncio at Cologne, Lucerne, Vienna, and to the French republic in 1801, where he arranged the concordat of that year, re-establishing the Roman Catholic form of worship. In May, 1805, he crowned Napoleon as king of Italy.

CAPRE'RA, or **CABRERA**, one of a group of small islands called the Buccinari islands, in the strait of Bonifacio, to the e. of the n. point of Sardinia (q.v.). They belong to the Italian province of Sassari. C. is separated from the coast of Sardinia by a strait of

little more than a mile in breadth, and by a similar narrow strait from the island of Maddalena, which lies to the west. Its greatest length, from n. to s., is about 6 m., and its breadth is from 2 to 3 miles. Like Maddalena and the rest of the Buccinari isles, and the neighboring coast of Sardinia, C. is rocky, bare, and unfertile. It has no streams, and is in few places adapted either for the pasture of cattle or for the plow. In former times, it was the abode only of wild goats—whence its name (Lat. and Ital. *capra*, a goat)—and rabbits, and was occasionally visited by goat-herds and fishermen. It has of late years acquired celebrity as the ordinary residence of Garibaldi, who acquired a property and built a house here in 1854. He dwelt here from 1854 to 1858, and again made it his abode in the autumn of 1860. It was to C. that he was sent in Sept., 1867, in honorable banishment by the Italian government, after having been taken prisoner at Asinulunga, in consequence of his design of entering the Roman territory to promote an insurrection and overthrow the papal government, and in C. he had his residence when not in Rome, till his death in 1882.

CAPRI (the ancient *Caprææ*), a charming island in the Mediterranean, at the entrance of the bay of Naples, about 3 m. from cape Campanella, and 20 m. s. of the city of Naples. On its small area of about 11 m. in circumference, it displays a rich variety of beautiful scenery, ruins of antiquity, and points of historical interest, and contains a pop. of (1890) 6,000 souls. The island is composed of two mountain masses, separated from each other by a depression like the seat of a saddle. That on the w., called monte Solaro, which is the highest and largest, has an elevation of about 1900 feet. The eastern part does not attain a height of more than 860 ft. above the sea. At the base of the eastern mountain is situated the town of C., built on a shelving rock, and guarded by walls, gates, and draw-bridges, with a cathedral, and a pop., including the district, of about 4,000. It commands a beautiful prospect, and communicates with the little town of Anacapri, on the western table-land, by a flight of 535 rude steps, cut in the face of the rock. There are only two safe landing-places on the island, and these are at C. and near it. C. was a celebrated place, in the times of Augustus and Tiberius. Ruins are still found of Roman baths and aqueducts, and of the 12 grand villas or palaces built in honor of the 12 chief deities by the emperor Tiberius, who passed the last 10 years of his life here in the practice of the grossest licentiousness and cruelty. The inhabitants now consist of fishermen, sailors, and a few traders, with vine-dressers and cultivators of olives in Anacapri. Wherever a tree can be planted, the hopeful and industrious people have prepared for it a soil by persevering toil in terrace-culture. Delicious quails, which in vast numbers alight on the island during their migrations to and from Africa, in spring and autumn, are taken in nets, and form an important item in the resources of Capri. To the w. of the town of C. is situated the *Grotta Azzurra* (blue grotto), a remarkable cavern, entered from the sea by a narrow opening not more than 3 ft. high. Inside, however, it is found to be of magnificent proportions, and of marvelous beauty, the gorgeous coloring being said to be produced by the reflection and refraction of the sun's rays through the water. Elliptical in form, it has a length of 165 ft., a breadth of 100 in the widest part, and a height of 40 in the loftiest, with 48 ft. of water beneath.

CAPRICCIO (Ital.), in art, is applied to a picture or other work which designedly violates the ordinary rules of composition. Foliated ornaments, with cupids or other figures appearing in them in situations not strictly natural, are capriccios.

CAPRICCIO, in music, is a species of free composition, without being subject to rule as to form or figure. Locatelli, at the beginning of the 18th c., composed capriccios for the violin. The most celebrated C. of modern times is Mendelssohn's B minor C. for pianoforte and orchestra.

CAPRICORNUS, the *Goat*, a southern constellation, and the tenth sign of the zodiac (q.v.); denoted by the sign ♈, representing the crooked horns of a goat. It is usually represented on the globe as having the forepart of a goat, but the hinder part of a fish. It is one of the least striking of the zodiacal constellations. It was, however, celebrated among the ancients, who regarded it as the harbinger of good-fortune, and as marking the southern tropic or winter solstice, wherefore they called it the "Southern Gate of the Sun." It contains no large stars, the two largest, which are situated in the horns, being only of the third magnitude. Neither of these rises above the horizon in the latitude of Gt. Britain. See **TROPICS**.

CAPRIDÆ, a family of ruminant quadrupeds, which, as defined by some naturalists, may be described as the *sheep* and *goat* family, including the Linnæan genera *ovis* (sheep, q.v.) and *capra* (goat, q.v.); but which is extended by others to include antelopes, their persistent horns being regarded as the great distinction between them and the *cervidæ* or deer family. In the more restricted sense, the name designates a very natural family, yet differing from the *bovidæ* or ox family more in general appearance than in other characters; whilst links of connection with the antelopes are not wanting, a very remarkable one being found in the prong-horn of America.

CAPRIFICATION, a method which has long been employed in the Levant for securing and hastening the maturation of figs, and which consists in suspending fruit-bearing branches of the wild fig above or beside those of the cultivated tree. The notion once

entertained, that this practice is analogous to that by which the fecundation of the female palm-tree is secured, is inconsistent with the now well-known fact, that the fig has both male and female flowers within its own receptacle; and it is therefore supposed that the effects of *C.* may result from the agency of a species of insect, of which the eggs have been deposited in the early wild figs, and which may promote fecundation by entering the receptacle of the cultivated fig, or perhaps by puncturing it may cause it to ripen sooner. In hope of a similar advantage, some French and English cultivators have inserted into figs straws dipped in olive-oil. But *C.* is scarcely practiced in the western parts of Europe, and has even been discontinued as unnecessary in some parts of the east where it once prevailed. See **FECUNDATION**.

CAPRIFOLIA CEE, a natural order of exogenous plants, consisting of shrubs and herbaceous plants, which have opposite leaves without stipules, and flowers disposed in corymbs, in heads, or in whorls. The calyx is 4 to 5 cleft; the corolla monopetalous, tubular, or wheel-shaped, sometimes irregular. The stamens are adherent to the corolla at its base, and alternate with its lobes. The ovary is free, 1 to 5 celled. The fruit is generally a berry, sometimes dry, but not splitting open when ripe. The order is very nearly related to *cinchonaceæ*, differing chiefly in the want of stipules. More than 200 species are known, chiefly natives of the temperate and colder parts of the northern hemisphere. To this order belong the honeysuckle, elder, viburnum, and snowberry.

CAPRIMULGIDÆ, a family of birds, of the order *insectores*, and tribe *fissirostres*, nearly allied to the *hirundinidæ* or swallow tribe, but differing from them in the still greater width of gape, and in having long stiff bristles at the base of the bill. They are insectivorous birds. They have very long wings, short legs, and toes united at the base by a membrane. The European goatsucker may be said to be the type of the family,

CAPRIVI DE CAPRARA DE MONTECUCULI, GEORGE LEO VON, chancellor of Germany, was born in Berlin in 1831. In his eighteenth year he volunteered in the Kaiser Franz grenadiers, and during the campaign in Bohemia in 1866 was made a major and put on the general's staff of the first army corps. He distinguished himself during the Franco-Prussian war, and as chief of staff of the 10th army corps served brilliantly at Metz and Orleans, and in the following Loire campaign. In 1882 he was appointed commander of the 30th infantry corps at Metz; in March, 1883, was selected by Bismarck to succeed Admiral Stosch as chief of the ministry of marine, greatly to the dissatisfaction of the officers of the navy. He gave much attention to the perfecting of torpedoed and torpedo-boats, and arranged a plan for the more rapid mobilization of the war vessels. In 1889 he resigned and was made commander of the 10th army corps, stationed in Hanover; and received the order of the Black Eagle. In March, 1890, he was made chancellor of the empire, and president of the Prussian council, succeeding Bismarck (q.v.). In July, 1890, he arranged with Lord Salisbury, representing England, the so-called Anglo-German partition of East Africa, for which see **GERMANY**. He resigned the presidency of the council in 1892, and the chancellorship in 1894.

CAPROIC, **CAPRYLIC**, and **CAPRIC ACIDS** are represented by the formulæ $C_6H_{12}O_4$, $C_8H_{16}O_4$, and $C_{10}H_{20}O_4$, and are members of the acetic or fatty-acid series. They derive their names from *capra*, a goat, in consequence of their more or less resembling in smell the odor of that animal. They may all be obtained from butter by pressing out the portion which remains liquid at 60°, saponifying this oil, and distilling the soap which is thus formed with sulphuric acid. The liquid which passes over contains these three acids, together with butyric acid.

CAPS AND HATS, names of political parties in Sweden in the early part of the 18th c., the former favoring and the latter opposing the alliance with Russia.

CAPSICUM, a genus of plants of the natural order *solanaceæ*, having a wheel-shaped corolla, projecting and converging stamens, and a dry berry. The species are all of a shrubby, bushy appearance, and have more or less woody stems, although they are annual or biennial plants. The number of species is very uncertain, some botanists distinguishing many, whilst others regard them as mere varieties of a few. They are natives of the warm parts of America and of Asia, have simple leaves, and rather inconspicuous flowers, and some of them are in very general cultivation in tropical and sub-tropical countries for their fruit, which is extremely pungent and stimulant, and is employed in sauces, mixed pickles, etc., often under its Mexican name of *chillies*; and when dried and ground forms the spice called *Cayenne pepper*. As a condiment it improves the flavor of food, aids digestion, and prevents flatulence. In tropical countries, it counteracts the enervating influence of external heat. In medicine, it is used as a stimulant, rubefacient, and vesicant; is often administered in combination with cinchona; and is particularly valuable both internally administered and as a gargle; not only in relaxed conditions of the throat, but in some of those diseases in which the throat is most dangerously affected. As a medicine, *C.* is administered in *pills*, mixed with bread; in the form of *tincture*, obtained by digesting the bruised *C.* in alcohol, or of an *infusion*, procured by digestion in water, with varying proportions of salt and vinegar. A gargle of *C.* is prepared by infusing it in water, along with candy-sugar and vinegar, and thereafter adding a little infusion of roses. It has no narcotic properties. It owes its power chiefly to *capsicins*. The fruits of the different species of *C.* differ in form, being round, oval, conical, heart-shaped, etc.; they vary from half an inch to 4 in. in length, and are sometimes of a bright red, sometimes of a yellow color. In all, the dry berry has an inflated appear-

ance, and contains numerous whitish flattened seeds, which are even more pungent than the leathery epidermis, or the spongy pulp. Cayenne pepper consists chiefly of the ground seeds. *C. annuum*, sometimes called common C., or Chilly pepper, is perhaps the most common species in cultivation; and in the southern parts of Britain, if raised on a hot-bed as a tender annual, it produces fruit in the open border. There are several varieties of it. *C. frutescens*, sometimes called goat pepper, and *C. baccatum*, sometimes called bird pepper, have great pungency, and the former is generally described as the true Cayenne pepper. *C. cerasiforme*, with a small cherry-like fruit, and therefore called cherry pepper, and *C. grossum*, with a large, oblong, or ovate fruit, known as bell pepper, are frequently cultivated.—The fruit is used either ripe or unripe, except for making Cayenne pepper, for which dried and ground fruit is employed. See *illus.*, TEA, COFFEE, ETC., vol. XIV.

CAPSTAN, on shipboard, is a ponderous mass of timber, whose uses are to heave the anchor, hoist up masts and guns, take in and discharge cargo, etc. It has very firm supports on the deck underneath it. It comprises a *barrel*, round which a rope or a chain coils; *whelps*, or pieces of timber, which enlarge the diameter without greatly increasing the weight; the *drum-head*, a polygonal flat piece of timber at the top, pierced laterally with holes; the *step*, or lowest part, which rests upon and is bolted to the beams; the *saucer*, an iron socket let into the top of the step; the *pivot* or *spindle*, which, resting on the saucer, forms the axis around which the C. turns; the *pawls*, short bars of iron, to prevent the reaction of the C.; *bars*, which enter the holes, and are the levers for enabling the sailors to work the C.; *pins*, placed vertically through the drum-head, for temporarily retaining the bars in their places; and the *shifter*, a rope connecting the outer ends of the bars. Among many improvements made in the arrangement and action of capstans is Wardill's, for increasing the bite or holding of a chain-cable around the circumference. In large vessels they are generally worked by steam.

CAPSULE, in botany, a dry fruit, *syncarpous* (or formed of several carpels united together into one), and opening either by valves, as in the fox-glove, primrose, and rhododendron, or by pores near the summit, which some regard as a sort of valves, and of which beautiful examples may be seen in the poppy and snapdragon. Capsules are either one-celled or many-celled. The *pyxidium* is a variety of C., which opens as if cut around near the summit, presenting the appearance of a cup with a lid, of which a very beautiful example may be seen in the *anagallis*, or pimpernel; and another in the great woody fruit of the different species of *lecylthis* and other *lecylthidaceæ*.

CAPSULE (*in medicine*), a thin membranous covering, casing, or envelope, like a pouch or bag, containing some part or organ; the capsule of the kidney is a smooth, fibrous membrane closely investing the kidney and forming its outer coat; the capsule of the lens is the transparent, elastic, brittle, and structureless membrane of the eye. The word has been also extensively used for a small, gelatinous case or envelope in which nauseous medicines are enclosed, to aid in the swallowing.

CAPTAIN means a head or leader and is a title found in almost every language for the chief of a small number of men. In the United States any one in charge of a craft, be she skiff or battle-ship, is as a rule called captain. In the army a captain ranks next above a first-lieutenant and below a major. When on duty with troops he commands a company, troop or battery. A captain present for duty with his command is responsible for its appearance, discipline, and efficiency. He is accountable for the care and preservation of the articles of public property that constitute its equipment; for the proper performance of duties connected with the subsistence, pay, and clothing of its members, and for the correct keeping and rendition of all company accounts, reports, and returns. The captain recommends the non-commissioned officers of the company who are appointed by the colonel, and from the sergeants he selects the first sergeant. In camp or barracks the captain maintains a careful supervision over the cooking and messing of his men, and is responsible for the camp and garrison equipage, and the arms and clothing of his company.

A captain in the navy ranks next above a commander and below a commodore, and ranks with a colonel in the army. There are 45 captains on the navy list on active duty, and they are promoted to the commodore's list in regular sequence whenever a vacancy occurs. They command naval vessels of the first or second rates, act as fleet-captains or chief of staff, command navy yards or naval stations, act as members of boards, and are frequently chiefs of bureau at the navy department, in which event they have, while in office, the relative rank of commodore. They also perform the duties of the captain of the yard at a navy yard, a position next to that of the commandant. On board a flag-ship where there is but one cabin the captain is entitled to one-third the space, the flag officer having the other two-thirds. Upon taking command of a vessel, the captain must inform himself fully as to her condition and that of her engines and boilers, and also the qualifications of the officers under his command. He is responsible for the discipline and government of officers and men, and he cannot sail from the United States until the crew are properly stationed and, as far as possible, exercised at the different evolutions. He is to make careful and repeated trials of the vessel under sail and under steam in every variety of wind and weather, so as to inform himself thoroughly as to her capabilities. He is not allowed to use more than two-thirds boiler power, except in an

emergency, and he is to use the engines in the most economical and efficient manner possible. The health of the crew, the dryness and the proper ventilation of the vessel are to have his particular attention. He investigates offences and awards punishments, and sees that a correct register is kept of the same, and he is at all times responsible for the safe navigating, handling and general efficiency of his command.

CAPTURE. See PRIZE.

CAPUA, a fortified city of Italy, in the province of Caserta, beautifully situated in a rich plain, on the left bank of the Volturno, about 18 m. n. of the city of Naples, with which it is connected by railway. It is a military station of the first class, its defenses having been greatly extended and improved by Vauban. As it is the only fortress which guards the approach to Naples from the n., it was regarded as one of the keys of the former kingdom of that name. The only objects of interest in the city are the cathedral, with some splendid granite columns from ancient *Casilinum*, upon whose site C. was built in the 9th c.; the church of the *Annunziata* with some bas-reliefs; and the arch of the *Piazza dei Giudici*, under which many ancient inscriptions still exist. Pop. about 13,500.

The ancient *Capua*, which enjoyed a reputation for wealth and population second only to Rome and Carthage, was situated about 2 m. s.e. of the present city, where its ruins are still to be seen, its site being occupied by the modern town of Santa Maria di Capua. C. was founded by the Etruscans, under the name of *Volturnum*, as early, according to some authorities, as 800 B.C., and was the chief city of the twelve said to have been founded by them in this part of Italy. Its present name was derived from the Samnites, who captured it in 423 B.C. After the battle of Cannæ, 216 B.C., the popular party opened the gates to Hannibal, whose army was greatly enervated by its luxurious winter-quarters here. The Romans obtained possession of the city in 211 B.C. In the 5th c., A.D., C. was devastated by the Vandals under Genseric. It recovered its prosperity again to some extent, but it was totally destroyed by the Saracens in 840. The citizens, who had fled to the mountains, were induced by their bishop to return some 16 years later, and found the modern Capua. From the existing remains of the walls and fortifications of ancient C., it has been estimated that it had a circumference of 5 or 6 miles. It had seven gates. Among the Roman antiquities, one of the most remarkable is the amphitheater, built of bricks, and faced with white marble. Well-preserved arches, corridors, and seats for spectators, still remain. It is calculated to have been capable of holding 60,000 persons.

CAPUCHINS, a branch of the Franciscan order, whose rule is essentially the same as that of the friars minor, or Minorites. They were founded by Matthew da Bassi, a Franciscan of Ancora, and were authorized by a bull of Clement VII. in 1528. At first they were persecuted by the other orders, but through the influence of the duchess Cibo, wife of the duke of Camerino, they obtained papal favor, and were permitted to impart their peculiar hooded habit to any who might be willing to join them, to live as hermits in wild and desolate places, to go barefoot, to wear beards, and to call themselves "Hermits Friars Minor." The pope, however, soon gave them the nickname "Cappucino," referring to the hood, one of their more conspicuous articles of apparel. They grew rapidly, and Matthew became the superior of the first convent. They have always had the reputation of great success in making converts. By late accounts they had 82 missions, in Europe, Asia, the East Indies, Africa, and South America. In the United States they have houses in the states of New Jersey, New York, and Wisconsin.

CAPULETS AND MONTAGUES, the English spelling of the names of the Cappelletti and Montecchi, two noble families of northern Italy, chiefly memorable from their connection with the legend on which Shakespeare has founded his play of *Romeo and Juliet*. According to tradition, both families belonged to Verona; but this does not appear to have been the case. The Cappelletti were of Cremona, and the fact that their burying-ground and the tomb of Juliet are shown at Verona, only proves how easy it is, in a country of ruins like Italy, to connect fact with fable. It has also been asserted that one family was Guelph and the other Ghibelline; but this is disproved by a reference to them in the *Purgatorio* of Dante (canto vi. l. 106). The poet is blaming the emperor Albert for neglecting Italy, the very garden of his domain. "Reckless man," he says, "come see how the Montecchi and the Cappelletti are oppressed;" and the context shows that the Guelphs were the oppressors in both cases of these great Ghibelline families. The emperor Albert was murdered in 1308, and this event has supplied the Veronese with a date for their legend. The first publication in which we recognize the essential incidents of Shakespeare's play is the novel *La Giulietta*, by Luigi da Porto, printed in 1535, after the death of the author. He states, in an epistle prefixed to the work, that the story was told him "by one Perigrino, a man fifty years of age, much experienced in the art of war, a pleasant companion, and, like almost all the Veronese, a great talker." In 1554, Bandello published in his collection of tales another Italian version of the legend. It was entitled *The unfortunate Death of two unhappy Lovers, one by Poison and the other of Grief*. Both writers fix the date of the event by saying it took place when Bartholomew dalla Scala or Scaliger ruled Verona. A French version of the tale was published by Pierre Borstean in Belleforest's *Histoires Tragiques*. It was translated into English in 1567, and published in Painter's *Palace of Pleasure*. About the same time, Arthur Brooke published an English poem on the same subject, entitled *The Tragical*

History of Romeus and Juliet, written first in Italian by Bandell, and now in English. There is evidence that an English play had appeared previously, and that before Shakespeare's time the story was so well known in England that it had supplied subjects for tapestries. Shakespeare's play seems to have been principally based on the English poem. It was Brooke who first called the Montecchi Montagues, and the prince of Verona Escalus, instead of Scala. Wright and Cary, in translating Dante, have followed the example of Shakespeare, and render the Italian names of the *Divina Commedia* into the familiar "Capulets and Montagues" of *Romeo and Juliet*. The historical date of the tragedy has not, however, been adopted by modern stage managers and Shakespearian critics, who very properly bring down the action from the beginning to the close of the 14th c., when commercial opulence, and the revival of arts and letters, supply accessories more in keeping with the drama than the ruder age to which history must assign the "civil broils" and the fall of the Capulets and the Montagues.—See notes to Dante in *Classici Italiani*, and Knight's and Dyce's *Shakespeare*.

CAPUT MORTUUM (Lat., "dead head"), in history, denotes the residuum of a traditional narrative after all the supernatural or extraordinary incidents have been cast aside. What remains may be possible or likely, but rests on no evidence. See **EUEMERISM**. In chemistry, the term was used by the old chemists for the residuum of chemicals after the volatile substances had escaped. It is still used metaphorically for a thing or institution which has been really destroyed, though the form is left, the essential and valuable elements having been removed.

CAPYBARA, *Hydrochaeris capybara*, a quadruped of the order *glires* or *rodentia*, and of the family *cavidae*, strongly resembling the cavy or Guinea-pig, although it is the largest existing rodent known, and aquatic in its habits. It is a native of South America, and abounds in many of the large tropical rivers. It is equal in size to a small pig. The dentition resembles that of the cavy, except that the grinding teeth are composed of numerous transverse plates, the number of the plates increasing as the animal advances in age; an interesting point of resemblance to the dentition of the elephant, and a link of connection between the rodents and the pachydermata. The C. feeds exclusively on vegetable food, browsing on the grass near the rivers, and often committing great ravages in plantations of sugar-cane. It runs badly, but swims and dives well, and has the power of remaining under water for seven or eight minutes. It is very inoffensive, and easily tamed. The flesh, except that of old males, is good, and is eaten by all classes of persons. The C. is sometimes called water-hog, of which *hydrochaeris* is a Greek translation. In Demerara, it is called water-horse, a corruption of the Dutch *water haas*—i.e. water-hare.

CARABIDÆ, a tribe of beetles, or coleopterous insects, of the section *pentamera* (see **COLEOPTERA**), corresponding with the genus *carabus* of Linnæus, but of which the species are extremely numerous, those already known being numbered by thousands. They mostly feed on other insects, worms, etc., and are extremely voracious and active, habits which are fully shared by their larvæ. Some of them burrow in the earth; most of them live under stones, under the bark of trees, among moss, etc.; and their bodies are adapted to this mode of life, being very firm and hard. Their legs are in general pretty long, and most of them pursue their prey rather by the use of their legs than of their wings, some of them indeed being wingless, or having only rudimentary wings. Many of them exhibit much beauty of colors and metallic lustre. The largest British species is only about an inch long, but some foreign ones are much larger. Some of the species of the restricted genus *carabus* are among the most common British insects. Their wings are not fitted for flight.—A very large and singular insect of the tribe C. is *mormolyce phyllodes*, a native of Java, which, in consequence of the extremely depressed form of its body, resembles some of the *mantidæ* (see **MANTIS**) and the insects known as leaf-insects (q.v.). To this tribe belong also the bombardier beetles (q.v.).

CARABOBO, a state in Venezuela on the Caribbean sea; a fertile, well-watered region, producing grains, fruits, and cattle. The chief exports are coffee, cacao, indigo, rice, corn, rum, and fruits. The climate is good in the inland region, but the coast is subject to fevers. Pop. '91, 198,021. Capital, Valencia.

CARABOU. See **REINDEER**.

CARACAL, *Felis caracal*, a species of lynx (q.v.), found in the warmer parts of Asia, and throughout the whole of Africa; and more probably than any European species, the lynx of the ancients. It is larger than a fox, about the same height, but much more powerful; of a uniform deep brown or wine-red color, except two spots near each eye, the under parts of the body, and inner parts of the legs, which are white, and tufts of long black hair which terminate the ears. The C. is powerful enough to tear a hound.

CARACALLA, properly named **MARCUS AURELIUS ANTONINUS BASSIANUS**, a Roman emperor, the son of the emperor Septimius Severus, was b. at Lyon, 188 A.D. He was playfully named by his father Caracalla, from his long hooded tunic, made in the fashion of the Gauls, and so called in their language. After his father's death, 211 A.D., he ascended the throne as co-regent with his brother Publius Septimius Antoninus Geta, whom he afterwards caused to be murdered. Having bribed (at enormous cost) the Prætorians to overlook this foul deed, and to make him sole emperor, C. next directed his

cruelty against all the friends and adherents of Geta, of whom twenty thousand of both sexes—including the great jurist Papinianus—were put to death. Innumerable acts of oppression and robbery were employed to raise supplies for the unbounded extravagance of the despot, and to pay his soldiers. In his famous constitution, he bestowed Roman citizenship on all his free subjects not citizens—who formed the majority, especially in the provinces—but simply in order to levy a greater amount of taxes on releases and heritages, which were paid only by citizens. In his campaigns, he imitated, at one time, Alexander, at another time, Sulla; while his main object was to oppress and exhaust the provinces which had been in a great measure spared by the tyranny of former emperors. In 217, he was assassinated, at the instigation of Macrinus, prefect of the Praetorians, by one of his veterans named Martialis, on the 8th of April, 217, on the way from Edessa to Carrhæ. Historians paint the life of C. in the darkest colors. Among the buildings of C. in Rome, the baths—Thermæ Caracallæ—near Porta Capena were most celebrated, and their ruins are magnificent. The baths proper are said to have occupied a site of 720 by 370 feet in a square enclosure bordered by a portico. The outside walls, extending about one quarter of a mile on each of the four sides, and the baths are said to have contained 1600 seats for the use of the bathers. The ruins include walls, arches and vaults, and in the largest of the baths there was an open space for athletic sports, around which were raised seats for the spectators. See *illus., SCULPTURE, vol. XIII.*

CARACARA, or **CARACARA EAGLE** (*polyborus*), a genus of birds of prey peculiar to America, and regarded as a connecting-link between eagles and vultures; agreeing with the former in their strongly hooked bill and claws, but with the latter in their naked face and propensity to prey on carrion. The name C. is originally Brazilian, and is derived from the peculiar hoarse cry of a common Brazilian species (*P. Braziliensis*), a bird of very fine plumage, and about 50 in. in expanse of wings, which is of frequent occurrence over a large extent of the American continent, and is sometimes to be seen even in the southern parts of the United States.

CARACAS, the capital of the republic of Venezuela, the most northerly state in South America, with Guiana on the e., and Columbia on the w., is situated in lat. 10° 30' n., and long. 67° 5' w., 16 m. s. of La Guayra, its port, with which it is joined by railway. It is 2,880 ft. above the tide-level, enjoying from this elevation a healthy air and a temperature so moderate as to average 68° and 72° F. in Feb. and June respectively. Standing immediately above the confluence of four streams, it is well supplied with cool water, which is distributed by means of fountains, pipes, and reservoirs. The neighborhood is subject to earthquakes—12,000 citizens having, in 1812, perished from this cause. The pop. in 1891 amounted to 72,429. The streets are straight and regular. The most splendid edifice is the church of Alta Gracia for the people of color, excelling the cathedral in the richness of its decorations. C. has a university founded in 1778.

CARACCI, a celebrated family of Italian painters, the founders of the Bolognese school of painting.

CARACCI, LUDOVICO, the son of a butcher, was born at Bologna, 1555. As a student, he was so inapt that his master recommended him to abandon the pursuit; but instead of that, he went to Venice and Parma, making acquaintance with the works of the great masters there, and returned to Bologna imbued with art principles quite opposed to the superficial mannerism then prevailing in his native city. In conjunction with two of his cousins, who, instructed by him, had imbibed the same ideas, he founded, in spite of great opposition, the school which afterwards became so famous in the history of painting. The first principle of this new school was, that "observation of nature ought to be combined with imitation of the best masters." The allied artists found numerous pupils, to whom they gave practical instructions in drawing from natural and artistic models, with theoretical lessons on perspective, anatomy, etc. So great was their success, that, in the course of a short time, all other schools of painting were closed in Bologna. Some of the finest works of this master are preserved in the *Accademia delle Belle Arte*, Bologna—among others, the "Madonna and Child Throned," "Madonna and Child Standing," the "Transfiguration," and the "Nativity of St. John the Baptist." Ludovico died in 1619.

CARACCI, AGOSTINO, cousin of Ludovico, was b. (1558) in Bologna. He became a disciple of his cousin, but he was of too versatile a genius to devote himself closely to any subject, though his magnificent painting of the "Communion of St. Jerome" proves that he might have attained to very great eminence had he devoted his undivided attention to the art; but he was in the habit of abandoning his easel for literature, poetry, and engraving on copper. As an engraver, indeed, he holds an important position in Italian art. He accompanied his younger brother, Annibale, to Rome, and there assisted in some of the paintings in the Farnese gallery; but his brother, who was a slave to his art, soon quarreled with him for his inattention, and he left Rome, and went to Parma. He died in 1602.

CARACCI, ANNIBALE, brother of Agostino, was b. (1560) in Bologna, where he learned, under his father, the business of a tailor, from which he was called away by Ludovico Caracci. His progress in the study of painting was rapid, and at first he took principally for his models Correggio, Titian, and Paul Veronese. His picture of "St. Roche distributing Alms" first gained for Annibale C. a wide reputation. His fame reached Rome, and he was employed to paint the Farnese gallery there, which is

considered his greatest work, and the manner of which partakes somewhat of Raphael and Correggio. On this gallery he was employed some eight years, and he received for his work the incredibly paltry sum of 500 crowns. In disgust and vexation, the artist threw aside his palette. He died in Rome in 1609, where his remains were interred, close to Raphael's tomb, in the Pantheon. Annibale C. was one of the greatest followers of Correggio, and in composition approached most nearly to the style of Raphael. Ludovico had a greater talent in teaching, and Agostino had a more versatile invention, but Annibale was unquestionably the greatest artist of the three Caracci.

CARACCI, ANTONIO, natural son of Agostino, was b. at Venice 1583; d. in 1618. He was a pupil under Annibale, and painted some excellent pictures.

CARACCI, FRANCESCO (styled FRANCESCHINI), brother of Agostino and Annibale, was b. in 1595, and distinguished himself as an eminent designer. He died 1622.—The best Italian masters of the 17th c.—Domenichino, Guido Reni, Albani, and others—proceeded from the school of the Caracci.

CARACCIOLI. The name of a Neapolitan family unfortunately associated with the memory of lord Nelson. Several members of this family were employed in political offices.—LOUIS ANTOINE DE C., b. in Paris, 1721, d. 1803, was the author of a pseudograph, entitled *Lettres Intéressantes du Pape Clement XIV.*, which mystified many readers throughout Europe.—FRANCESCO C., 1752–1799; a Neapolitan admiral, entered in early life the marine service, and distinguished himself at Toulon, 1793. In the year 1798, the offensive conduct of the court of Naples toward C. induced him to return from Palermo, where the court was then residing, to Naples, where he entered into the service of the republic established by the French invaders, and, with a few vessels, prevented the attempted landing of a Sicilian and British fleet. In 1799, when Ruffo took Naples, C. was arrested, contrary to the terms of capitulation, sentenced to death by the junta, hanged on the mast of a frigate, and his corpse thrown into the sea. This affair, to which lord Nelson was a consenting party, is a stain on the reputation of the English admiral.

CAR'ACOLE, in horsemanship, a sudden half turn, sometimes performed frequently in an attack of cavalry to mislead the enemy as to the point at which the assault is to be made.

CARACTACUS, a king of the Silures, who inhabited s. Wales, was one of the most persistent enemies of the Romans in Britain. For nine years he warred gallantly against the invaders, but at length was completely overthrown. His wife and daughters fell into the hands of the victors, and his brothers surrendered. C. himself fled to Cartimandua, queen of the Brigantes, who delivered him up to the Romans. He was carried to Rome, 51 A.D., and exhibited to the people by the emperor Claudius. When he approached the imperial seat, we are told, he addressed Claudius in so noble a manner, that he and his relatives were immediately pardoned. They appear, however, to have lived during the remainder of their lives in Italy.

CAR'ADOC SANDSTONE and BA'LA BEDS, a division of the lower Silurian system, so named from their development at Caer Caradoc, in Shropshire. They consist of sandstones, grits, and slates, with occasional beds of limestone. Enormous masses of contemporaneous igneous rocks are interstratified with them. They attain a thickness of 9,000 ft., not including the igneous rocks.

CARA'FA DE COLOBRANO, MICHELE, 1785–1872; an Italian composer; in early life a soldier in the French army. Among his operas are *Masaniello* and *Le Solitaire*. He was a member of the Paris academy of fine arts, professor in the conservatoire, director of military music at the gymnase, and a member of the legion of honor.

CARAFE (Fr., from Italian *caraffa*, a decanter), a water-bottle of glass for the table or toilet, a term long in use in Scotland, but of later introduction into England and the United States.

CARAGLIO, a t. of northern Italy, in the province of Coni, 6 m. w. of the city of that name. It is situated on the Grana, and has manufactures of silk. Pop. about 7000.

CAR'RAITES. See JEWISH SECTS

CARAMA'NIA. See KARAMAN.

CARAM BOLA, an East Indian fruit, of the size and shape of a duck's egg, but with five acute angles, or longitudinal ribs. It has a yellow, thin, smooth rind, and a clear watery pulp, in some varieties sweet, in others acid, of very agreeable flavor. It is often used in making sherbets, and in tarts and preserves; and is known to the British in India as the *Coromandel gooseberry*. It is one of the most universally cultivated and abundant of the fruits of India. It is produced by the *averrhoa carambola*, a small evergreen tree, or bush, of the natural order *oxalidæ*. The BILIMBI, or BLIMBING, is the very acid fruit of another species of the same genus, *A. bilimbi*, also East Indian. Both species are now much cultivated in the tropical parts of America. Both exhibit an irritability of leaf resembling that of the sensitive plant; they also display in a remarkable degree the phenomena known to physiologists as those of sleep of plants (q.v.).

CARAMEL is the name applied to the dark brown and nearly tasteless substance produced on the application of heat to sugar (q.v.). It is likewise formed during the roasting of all materials containing sugar, such as coffee, chiccory, and malt (see **BEER**), and is one cause of the dark color of porter and infusions of coffee. It is also employed in the coloring of whisky, wines, vinegar, etc. The name is also given to a kind of confectionery (q.v.).

CARAMNASSA, a river in the presidency of Bengal, which rises in lat. $24^{\circ} 34'$ n., and long. $83^{\circ} 46'$ e., and, after a course of about 150 m., enters the Ganges from the right in lat. $25^{\circ} 28'$ n., and long. $83^{\circ} 58'$ east. It is remarkable on several grounds. Though, on issuing from its source, it is clear as crystal, it is yet said to be both nauseous and noxious—a peculiarity which the natives impute to various supernatural causes; about 50 m. from its mouth, it is crossed by a stone bridge of three wide arches, which forms part of the grand road from Calcutta to Delhi; and lastly, it is so exceptionally subject to floods, that it has been known to rise 25 ft. in a night.

CARANA RESIN, more commonly, but less correctly, called **GUM CARANA**, is a resinous substance imported from the tropical parts of America. Its properties and uses resemble those of *tacamahac*. It is entirely soluble in alcohol, and melts in a slight heat. It is not well known what tree produces it.

CARANJA, an island on the e. side of the ordinary entrance of the harbor of Bombay (q.v.), separated from the mainland by a narrow and unserviceable channel of 4 m. in length. It is itself 2 m. broad, being comparatively level and fertile, with the exception of two hills—the Little Hill in the n., and the Great in the south.

CARANX. See **SCAD**.

CARAPA, a genus of plants of the natural order *meliceæ*, natives of warm climates. *C. Guianensis* or *guareoides*, sometimes called the *anderaba*, also the *C. tree*, is a large tree with beautiful shining pinnate leaves, which have many leaflets, a native of Guiana and the adjacent countries, where its bark has a great reputation as a febrifuge, and the oil obtained from its seeds is much used for lamps. Masts of ships are made of its trunk. The oil, which is called oil of carapa, is thick and bitter, and is anthelmintic.—*C. Touloucouina*, or *Guineensis*, an African species, yields a similar oil, which is employed by the negroes for making soap, and for anointing their bodies, its bitterness protecting them from the bites of insects, a purpose to which the oil of *C.* is also applied in South America.—These species are very similar, and are supposed by some botanists not to be essentially distinct.

CARAPACE, the dorsal shield or buckler of chelonian reptiles (tortoises and turtles), and of the *crustacea malacostraca* (crabs, lobsters, etc.). In animals so widely different, however, there is only, a general similarity in the appearance of the *C.*, and the purpose which it serves; its organic relations are very different. For notice of these, we refer to the articles **CHELONIA** and **CRUSTACEA**.

CAR'AT, originally, it would seem, the name given to the seeds of the Abyssinian coral flower (q.v.) or coral-tree (*erythrina Abyssinica*); but these, which are small, and very equal in size, having been used in weighing gold and precious stones, *C.* has become the designation of the weight commonly used for weighing precious stones, and particularly diamonds. The seeds of the carob (q.v.) tree have also been said to be the original *C.* weights of jewelers, but with less probability.

Goldsmiths and assayers divide the troy pound, ounce, or any other weight, into 24 parts, and call each a *C.*, as a means of stating the proportion of pure gold contained in any alloy of gold with other metals. Thus, the gold of our coinage and of wedding-rings, which contains $\frac{22}{24}$ of pure gold, is called "22 carats fine," or 22 *C.* gold. The lower standard used for watch-cases, etc., which contains $\frac{18}{24}$ of pure gold, is called 18 *C.*, and so on. The *C.* used in this sense has therefore no absolute weight; it merely denotes a ratio. This, however, is not the case with the *C.* used for weighing diamonds, which has a fixed weight, equal to $3\frac{1}{8}$ troy grains, and is divided into quarters, or "C. grains," eighths, sixteenths, thirty-seconds, and sixty-fourths. These *C.* grains are thus less than troy grains, and therefore the jeweler has to keep a separate set of diamond weights.

CARAU'SIUS, a supposed native of Holland, of whom nothing is certainly known except that he had a conspicuous part as an ally of the Romans in the conquest and ruling of Britain near the close of the 3d century. He had been put in command of the fleet in the English channel for the purpose of protecting the coasts of Britain and Gaul from the Frisian pirates; and his conduct had been such that the Roman emperor Maximilian gave an order for his death. *C.* immediately assumed the title of emperor of Britain, and held power for about seven years, his independence having been acknowledged by the Romans, whose empire was rapidly falling into ruin. He was assassinated at York in 293 by his chief officer and rival, Allectus, who held the imperial title for three years, at end of which time (296) Constantine Chlorus re-established the rule of Rome.

CARAVA'CA, a t. in Spain, in the province of Murcia, about 39 m. n.w. of the city of that name, is situated on the slope of a hill crowned with a fine old castle. Its principal

streets are wide, clean, and well paved; it has a fine church, with a miraculous cross, that is annually taken down and bathed in the waters of the town, to which it is supposed to communicate sanitary properties. It has manufactures of linen and woollen fabrics, soap, paper, leather, etc. Pop. about 15,000.

CARAVAGGIO, a t. of northern Italy, in the province of Bergamo, about 24 m. e. of Milan. In the principal church are some esteemed paintings by Campi; and C. is also celebrated as the birthplace of the painters Polidoro Caldara, and Michael Angelo Merighi, both surnamed Caravaggio. In the neighborhood is a sanctuary of the Madonna, built from designs of Pellegrini (1575). Pop. about 8,000.

CARAVAGGIO, MICHAEL ANGELO AMERIGHI or MERIGHI DA, a celebrated Italian painter, was b. 1569, at Caravaggio, in Lombardy, northern Italy. His father, who was a mason, employed him in making paste for the fresco-painters, and in this way the artistic genius of the boy was stirred. After studying the works of the great masters in Milan and Venice, he went to Rome, where he lived for some time in very reduced circumstances. At length a picture of his attracted the notice of Cardinal del Monte, who now patronized the young artist; but the ferocious and quarrelsome character of C. soon involved him in difficulties. Having fled from Rome to Malta, on account of manslaughter, he obtained the favor of the grand-master by painting an altar-piece in the church of St. John, and other pictures. His quarrelsome nature soon forced him to flee from Malta; and, in making his way back to Rome, he was wounded, lost all his baggage, caught a violent fever, and on reaching Porto Ecole, lay down on a bank and died (1609), at the age of 40. Trueness to nature was the object aimed at by C., who left all schools, and devoted himself to paint life as he found it in lanes, alleys, and other resorts of the lower classes. He studied no such matters as refined sentiment or elevation of realities, but gave in his paintings expression to his own wild and gloomy character. One of his best paintings, "The Fraudulent Gamblers," is preserved in the Sciarra gallery, at Rome. His shadows are deep, his backgrounds very obscure; in consequence of which the whole picture seems to possess a kind of mysterious greatness, that is very imposing. Even Rubens confessed that C. was his superior in *chiaro-oscuro*. When he painted sacred subjects, he remained falsely faithful to the low realities of Italian life; so that several of his pictures painted for churches, had to be removed from their places, because they could not be harmonized with sacred associations. Kugler, the German critic, has justly said of one of C.'s most celebrated works, a "Burial of Christ," that it appears "like nothing better than the funeral of a gypsy chieftain."—An earlier Italian painter of less eminence, **POLIDORO CALDARA DA CARAVAGGIO**, was born in 1495, and murdered in 1543.

CARAVAN (from the Persian *karvan*, i.e., trader), the name given to the great assemblages of travelers which, at stated times, traverse the deserts of Asia and Africa. Many caravans are entirely for the purposes of trade, the merchants associating themselves for mutual help and protection. A C. sometimes has so many as 1000 camels, which follow each other in single file, so that it may be a mile or more in length. The most celebrated caravans are those formed by pilgrims going to Mecca, particularly those which annually assemble at Cairo and at Damascus. The latter consists of 30,000 to 50,000 pilgrims, and is under the special protection of the Turkish sultan. The caravan by which the Persians travel to Mecca starts from Bagdad, and is the vehicle of a very important trade. The great Indian C. to Mecca, which started from Muscat, has been long given up. Mecca, upon the arrival of the caravans, bringing goods from so many different parts of the world, presents all the appearance of a vast fair. The trade between Tripoli and the interior of Africa is exclusively carried on by caravans, likewise that between Darfur and Egypt. The great trade between Russia and China is also a C. trade. In the east, caravans in which the camels have a load of 500 to 600 lbs. are called *heavy* caravans; *light* caravans are those in which the camels have only half that weight, so that the daily journeys may be longer. *Heavy* caravans travel from 17 to 18 m. a day; *light*, from 22 to 25. The caravans are generally conducted with great regularity, and assemble at and start from stated places on stated days. The leader of the Mecca caravans is called *emir-el-hadsch*, i.e., prince of the pilgrims. In trade-caravans, a leader, who is called *karwan-baschi*, is elected by the merchants from their own number.

Among the knights of Malta, caravans meant the troops of knights appointed by the order to serve in garrisons, and also the cruises of their galleys against the Turks.

CARAVANCES. See CHICK PEA.

CARAVANSARAI, or KHAN, an eastern institution, a sort of unfurnished inn to provide travelers with a shelter. Those in towns and cities, which are generally built for traders, and charged a small sum a day, are handsomer and more convenient—having doors to the apartments—than those met with on the roads or outside the walls of the cities. They commonly consist of a square building of four wings built round a courtyard, in which the beasts of burden may be inclosed, and where there is usually a well of water; the lodgings are small rooms, about 7 or 8 ft. high, which run round the courtyard, and are bare of every article of furniture.

These caravansarais are an institution of very ancient date, being the "inns" of Gen.

xlii. 27, xliii. 21; and it was in the stable of such a place, there being no room for his parents in the lodging apartments, that our Savior was born (Luke ii. 7). They belong either to government, to some private individual, or are the property of the church (mosques), those situated in towns or cities are charged, but not more than two or three Turkish piastres a day; those situated on the road are usually free. There are some large and very handsome caravanserais at Cairo, Damascus, Beyrout, Aleppo, etc. The steward or keeper of a C. is called a *caravanseraskier*.

CARAVEL/LAS, a seaport of Brazil, in the province of Espiritu Santo, near a bay of that name; pop. about 3,000. It is the principal port of the surrounding country, and the head-quarters of the whale fishery of the Abrothos islands, which lie off the coast.

CARAWAY, *Carum carui*, a plant of the natural order *umbelliferae*, growing abundantly in meadows and rich pastures in the middle and s. of Europe, and in some parts of Asia, naturalized in many places in Britain. In some parts of Holland and Germany, and also in the counties of Kent and Essex in England, it is extensively cultivated for its aromatic seeds—in more strict botanical language, *carpels*—which are used medicinally as a carminative and tonic, and are also very much used as an aromatic condiment, and by confectioners, distillers, and perfumers, entering into the preparation of liqueurs, cakes, sweetmeats, scented soaps, etc. They depend for their aromatic properties on a volatile oil called oil of C., which is obtained by bruising C. seeds, and distilling them with water, and is at first limpid and colorless, but becomes yellow and subsequently brown by keeping. Oil of C. is used medicinally to relieve flatulence, and to correct the nauseating and griping tendencies of some cathartic medicines; also in the preparation of *spirit of C. and C. water*.—Spirit of C., which may be prepared either by dissolving the oil of C. in proof-spirit, or by distilling bruised C. seeds along with proof-spirit, is much used in Russia and Germany as a liqueur (*kümmel-branntwein*), sweetened with sugar.—C. has a branching stem 1 to 2 ft. high, with finely divided leaves, and dense umbels of whitish flowers. The fruit is oblong, each carpel having five thread-like ribs, with a single *villa* (see *UMBELLIFERÆ*) in each of the interstices. The white carrot-shaped root of C. is sometimes used like carrots or parsnips, but has a very strong flavor.—C. has a great enemy in the **CARAWAY MOTH** (*hæmylis daucella*), the larva of which destroys both its stem and flowers.

CARBAZO/TIC ACID, or **PICRIC ACID**, is a substance of great importance in dyeing, which is obtained by the action of strong nitric acid and heat on many complex organic materials, such as silk, indigo, salicine, and a variety of resins. On a commercial scale, it is best obtained from the heavy oil of coal-tar, which distills over from crude tar between 300° and 400° F. (150–200° C.), or from the resin of *xanthorrhæa hastilis*. The hot nitric acid solution is strained from impurities, and on cooling, yellow crystals separate of C. A., which can be purified by washing with cold water. These crystals are readily soluble in alcohol and ether, and dissolve in 80 or 90 times their weight of cold water, yielding a yellow solution, which has a very bitter taste, and stains the skin yellow; and when silk which has been treated with a mordant of alum, or cream of tartar, is immersed in a solution of C. A., it is dyed of a beautiful permanent yellow color. The bitter taste of C. A. has led to its being fraudulently employed, instead of hops, in communicating a bitter taste to beer.

CARBIDES, compounds of carbon with a metal. None occur in a natural state, and they are difficult to obtain in a definite form. Carbon makes the metal hard and brittle.

CARBINE is a light kind of musket, named probably from the Carabins. See next article. It is now used by the cavalry, the yeomanry cavalry, the Irish constabulary, and other corps. The best carbines are now rifled. A considerable number of American carbines, rifled and breech-loading, were purchased at a high price by the English government in 1856. This American C. has a barrel only 22 in. in length, and a total weight of 7½ lbs. It is simple in construction, has a great range, hits a mark with accuracy, may be fired with rapidity, requires little cleaning, can be loaded without a ramrod, and supplies itself with caps from a reservoir in the hammer. Among English makers, Mr. Prince has successfully applied the breech-loading principle to carbines. The Victoria cavalry C. has a barrel 26 in. long, with 0.733 in. bore; its weight is 7½ lbs., and it is fired with 2½ drams of powder. See *illus., GUNS*, vol. VII.

CARBINEERS, or **CARABINEERS**, are said to have derived their designation from the Arabs, among whom the *Carabins* or *Karabins* were light horsemen, stationed at outposts to harass the enemy, defend narrow passes, etc.; in action, they took the place of skirmishers. A corps under the same name was raised in France in 1560; but the designation has not been much used in that country since the introduction of hussars and lancers. In the English army, C. was at one time a frequent designation for cavalry.

CARBOHY DROGENS, or **HYDROCARBONS**, are a series of compounds belonging to organic chemistry, which are composed of carbon and hydrogen, only in such proportions that the various members of the group differ from each other in definite and regular numbers of atoms of carbon and hydrogen. The best-marked group of hydrocarbons commences with methylene, CH₂, which may be regarded as the first step in the ladder, and by the successive addition of groups containing one atom of carbon and two atoms

of hydrogen, we obtain ethylene or olefiant gas, C_2H_4 , propylene, C_3H_6 , butylene or oil gas, C_4H_8 , amylene, C_5H_{10} , etc. There are also series beginning with methyl, CH_4 , then ethyl, C_2H_6 , and with hydride of methyl or marsh gas, CH_4 , then hydride of ethyl, C_2H_6 . The members of these groups are likewise characterized by a gradual ascending difference in their chemical and physical properties, especially the boiling-point, which rises by a given amount.

CARBOLIC ACID, or **PHENIC ACID**, *Phenyl alcohol*, *Phenol*, C_6H_5OH , is the principal acid substance procured during the distillation of coal-tar. It is produced also by the distillation of gum benzoin and the resin of *xanthorrhoea hastilis*. It has been supposed probably erroneously, to be present in normal urine. It crystallizes at ordinary temperatures in colorless needles. It smells like tar or creosote, and has a hot taste. It is a powerful antiseptic, and quickly arrests all putrefactive and fermentive changes. Hence it is used, freely diluted in water, as a dressing in the antiseptic system of treating wounds, first practised by Mr. Lister, when professor of clinical surgery in Edinburgh university. It is also used for purifying or rendering inoffensive sewage (q.v.), etc.

It has been introduced into the American pharmacopœia, where its characters and tests are thus described: "In colorless acicular crystals, which at a temperature of $104^{\circ} F.$ ($40^{\circ} C.$) become an oily liquid, having a strong odor and taste resembling that of creosote, which it also resembles in many of its characters and properties. Its specific gravity is 1.065; boiling-point, $356^{\circ} F.$ ($180^{\circ} C.$). The crystals readily absorb moisture on exposure to the air, and they are thus liquefied; the acid, however, is but slightly soluble in water, but it is freely soluble in alcohol, ether, and glycerine. It does not redden like litmus paper; a slip of deal dipped into it, and afterwards into hydrochloric acid, and then allowed to dry in the air, acquires a greenish-blue color. It coagulates albumen. It does not affect the plane of polarization of a ray of polarized light." It may be taken internally in doses of from one to three grains in the same class of cases as those in which creosote is prescribed. Its principal uses are as external applications, in which, in various degrees of dilution, it is serviceable in unhealthy ulcerations, gangrenous sores, *ozæna* and all fetid discharges, gleet, the destruction of lice, and especially, as Prof. Lister has shown, as an application in compound fractures (in which it coagulates all albuminous effusions, and forms a solid crust, impermeable to air, over the broken surface), and to abscesses immediately after they have been opened. Indeed, it is most probable that his investigations on the treatment of abscess will, like those on the treatment of compound fractures, lead to a total alteration in this department of surgery. The observations of Pasteur and others have shown that, in even apparently the purest air, numerous organic germs are always floating. In a hospital ward, these germs are multiplied to an extraordinary degree. In any wound exposed to the atmosphere (as a compound fracture), decomposition takes place by the action of these germs, and hence it is necessary to introduce the C. A., which has the power of destroying these germs, into the interior. In an unopened abscess, no septic organisms are present, and the object of the surgeon is to guard against their introduction from without, and at the same time to afford a free exit for the discharge of the contents of the abscess. The following are the outlines of Prof. Lister's mode of proceeding: A square piece of rag is dipped in a solution of one part of crystallized C. A. and four parts of boiling linseed oil, and is laid upon the skin where the incision is to be made. The lower edge being raised, a scalpel dipped in the oil is plunged into the cavity of the abscess, and a sufficient opening made; and the moment the knife is drawn, the raised part of the rag is dropped upon the skin as an antiseptic curtain, beneath which the pus escapes. The cavity of the abscess is firmly pressed, so as to remove as nearly as possible all the existing pus, and if it should seem expedient, a piece of lint dipped in the oily mixture may be introduced, so as to check bleeding and prevent primary adhesion of the cut surfaces. "Thus," says Prof. Lister, "the evacuation of the original contents is accomplished with perfect security against the introduction of living germs. This, however, would be of no avail unless an antiseptic dressing could be applied that would effectually prevent the decomposition of the stream of pus constantly flowing out beneath it." He finds that the most suitable dressing is made as follows: Six tea-spoonfuls of the oily solution are mixed with common whiting (carbonate of lime) so as to form a putty, which is spread upon six inches square of common tinfoil, strengthened with adhesive plaster to prevent its tearing. The tin thus spread with putty is laid upon the skin, so that the middle of it corresponds with the point of incision, the antiseptic rag used in opening the abscess being removed the moment previously. The tin is then fixed with adhesive plaster, the lowest edge being left free for the escape of the discharge into a folded towel placed over it, and secured with a bandage. The dressing must be removed every day, and a piece of rag dipped in the oily solution must be placed on the incision when the first tin is removed, so as to guard against the possibility of the entrance of germs during the cleansing of the skin with a dry cloth, and pressing out any discharge that may exist in the cavity. If a piece of lint was inserted into the wound, it must be removed when the tin is applied. From the absence of the irritation excited by decomposition, pus almost at once ceases to be formed under this treatment; and large

abscesses, after their original contents have been evacuated, often yield in 24 hours only a few drops of serum in the course of a few days. The pharmacopœia gives the glyceride of C. A. (consisting of one part of the acid to four of glycerine) as a good form for local application; but the proportion of acid must vary with the case. In the early experiments made with Prof. Koch's (q.v.) lymph in 1890, the dilutions were made in part with C. A., whence it was claimed by certain physicians that the destruction of the bacteria was due partly, or perhaps wholly, to the action of the C. A.

The value of C. A. as a disinfectant was placed beyond all doubt by the investigations made at the request of the royal commissioners, who were appointed to obtain information and report on the cattle disease. In the same way, C. A. is highly serviceable in military camps, on board ship, in disinfecting dunghills, in purifying the air of sick-rooms, stables, bird-cages, and any place where the germs of disease do or may lurk. It is extensively used for preserving wood, as in railway sleepers. It has recently acquired importance as a source of dye-stuffs, Victoria orange, phénicienne or phenyl brown, coralline, etc. C. A. acts as a powerful poison on animal and vegetable life in general. The creasote (q.v.) obtained from coal-tar is often simply a pure form of carboic acid. See Cheyne's *Antiseptic Surgery* (1882) and ANTISEPTICISM.

CARBON is one of the elementary substances largely diffused in nature. It occurs uncombined in the mineral graphite, or black-lead (q.v.), and in the diamond (q.v.), which is pure crystallized carbon. It is much more abundant, however, in a state of combination. United with oxygen, it occurs as carbonic acid, CO_2 (q.v.), in the atmosphere, in natural water, in limestone, dolomite, and ironstone. In coal, it is found combined with hydrogen and oxygen; and in plants and animals, it occurs as one of the elements building up wood, starch, gum, sugar, oil, bone (gelatine), and flesh (fibrine). Indeed, there is no other element which is so characteristic of plant and animal organisms, and it ranks as the only element never absent in substances obtained from the two kingdoms of organic nature. Wood-charcoal, coke, lampblack, and animal charcoal are artificial varieties, more or less impure, of carbon. The atomic weight or equivalent of C. is 6 (new sys. 12); the specific gravity greatly varies; that of the diamond is 3.330 to 3.550 (water being 1.000), and of graphite 1.800. C., in its ordinary forms, is a good conductor of electricity; in the form of diamond, it is a non-conductor. Of heat, the lighter varieties of C., such as wood-charcoal, are very bad conductors; graphite in mass has very considerable conducting powers. At ordinary temperatures, all the varieties of C. are extremely unalterable; so much so, that it is customary to char the ends of piles of wood which are to be driven into the ground, so as by this coating of non-decaying C. to preserve the interior wood; and with a similar object, the interior of casks and other wooden vessels intended to hold water during sea-voyages, are charred (coated with C.), to keep the wood from passing into decay, and thereby to preserve the water sweet. Its power of arresting odors and colors likewise varies much. See BONE-BLACK. In the simple property, even of combustion, there is a marked difference. Wood-charcoal takes fire with the greatest readiness, bone-black less so; then follow in order of difficulty of combustion—coke, anthracite, lampblack, black-lead, and the diamond. Indeed, black-lead is so non-combustible, that crucibles to withstand very high heats for prolonged periods without breakage or burning, are made of black-lead; and the diamond (q.v.) completely resists all ordinary modes of setting fire to it. In the property of hardness, C. ranges from the velvet-like lamblack to diamond, the hardest of gems.

Carbon for electrical purposes.—When C. is obtained of sufficient density, it is found to be a good conductor of electricity, and to make an excellent electro-negative element in a galvanic pair. Graphite displays these qualities to advantage, and so does the hard incrustation of C. that is found sublimed in gas retorts. Coke and wood-charcoal are too porous to possess them to any great extent. The scarcity of graphite, and the precarious supply of retort C., preclude the possibility of obtaining much practical advantage from the electrical properties of C. with these substances alone. We are indebted, however, to prof. Bunsen, of Heidelberg, for the discovery of a process whereby a C. of the requisite density can be manufactured with great ease and economy. The carbons thus obtained for galvanic batteries rival platinum in electric energy, and they have aided in no small degree, from their cheapness, in heightening the utility of galvanic electricity. The Bunsen carbons, as manufactured in Germany, are of the form of hollow cylinders, whereas those made in France and this country are solid rectangular prisms. The following are the more important details of the process. Two parts of coke, and one of baking-coal—the proportion varying to some extent with the materials—are ground to a fine powder, and passed through a sieve. The powder so got is transferred to iron-plate molds of the required shape, the seams of which are merely clasped together, and luted with clay. No pressure is employed in filling them, other than that of shaking. When the molds are filled, they are placed in a furnace, and kept there till all carburetted hydrogen has escaped from them. They are then taken out, and allowed to cool before the mass within is removed, which is now found to have taken a solid form, and to be so hard that it may be turned or ground to the exact size wanted. At this stage, the carbons are destitute of electrical action, and they must consequently be rendered more dense by a subsequent process. This consists in soaking them thoroughly in thick sirup, or, better still, in gas-tar thickened by boiling, and laying them aside till dry, after which they are backed with charcoal-dust in fire-proof crucibles,

and exposed for a considerable time to a high heat. If one soaking and charring is not enough, the same may be repeated until sufficient density is obtained. Throughout the process, it is essential that all flaming matters be driven off, so as to leave only the C. in the mold; and care must be taken that no air be admitted to the mold when under the action of heat, otherwise there would be a loss of C. from combustion. The manufacture of these carbons may be carried on contemporaneously with that of gas. For a description of the carbon pencils used in arc lights and the filaments of incandescent lamps see ELECTRIC LIGHTING.

CARBON, a co. in e. Pennsylvania; 412 sq. m.; pop. '90, 38,624. Co. seat, Mauch Chunk.

CARBON, a co. in s.e. Wyoming, touching Colorado, and crossed by the Union Pacific railroad; area, 7800 sq. m.; pop. '90, 6857. Co. seat, Rawlins.

CARBONA'RI (literally "colliers" or "charcoal-burners"), the name of a secret political society, first, in some degree, made known in 1820. The constitution, like the precise objects of the C., still remains in a great measure secret; though they have printed instructions, catechisms, statutes, rituals, etc., for their associates. The statements respecting the high antiquity of this secret confederacy are quite fabulous. There is every reason to believe that it originated during the last French *régime* in Naples. Botta, in his *Storia d'Italia*, states that, under Murat's government, the Neapolitan republicans, equally hating the French and king Ferdinand, escaped into the wild defiles of the Abruzzi, and here, naming themselves "C.," formed a secret society. It is said that their leader, Capobianco, had great powers of popular eloquence, and that their motto or war-cry was, "Vengeance for the lamb torn by the wolf." See CAPOBIANCO.

The peculiar phraseology of the C. is taken from the vocation of charcoal-burners. For instance, they are (or were) wont to speak of "clearing the forest of wolves." The "wolves" probably meant at first foreign tyrants; but in the course of time, after the restoration of the Neapolitan Bourbons, such symbolical expressions had reference to their despicable misrule. Among themselves the initiated were styled "good cousins." The various societies do not seem to have possessed a common center, or to have been properly organized for combined action. A place of meeting was styled "a hut" (*baracca*); the external neighborhood "the forest;" and the interior of the hut was the *vendita* or "place for selling coal." A union of several of these huts formed a "republic." The superior huts (*alte vendite*) at Naples and Salerno, endeavored, but without success, to effect a centralization of the Carbonari. The society, soon after its institution, numbered 24,000 to 30,000 adherents, and increased so rapidly in Italy, that in Mar., 1820, it is said as many as 650,000 new members were initiated, including considerable numbers of the military and the clergy. The religious and Protestant character of the order is expressed in its statutes, which include the article: "That every carbonaro has the natural and unalterable right of worshiping God according to his own convictions."

After the restoration of the Bourbons several secret political unions were formed in France, and in 1820 were confederated with the Carbonari. Paris, after the prosecutions against the secret societies of Italy, was made the head-quarters of a carbonarism which, adopting all the symbolic phraseology, rules, and regulations of the Italian societies, received from the rapidly systematizing genius of the French, an organic character which it had never before possessed. The initiated styled themselves *bons cousins*, and spoke of the uninitiated as *paganî* (heathens). Written documents and communications were strictly prohibited by the heads of the union, and treachery was to be punished by assassination. After the close of the French and Spanish war, the C., whose activity in contriving plots had excited the terror of the French prefects, restricted its endeavors to the circulation of republican ideas, without direct attempts towards insurrection. After the July revolution, several of the leading French C. attached themselves to the new régime, and their society was gradually dissolved. In its place the new *Charbonnerie Démocratique* was founded, having for its object the establishment of a republican government, founded on the principles of Babeuf (q.v.). The endeavor of these new C. to make Paris the center of all political movements, led to the secession of the Italian refugees, who associated themselves under the title "Young Italy." French carbonarism is not known to exist at present, and it is possible that even in Italy the triumphs of constitutional patriotism during recent times have rendered its existence no longer necessary, but it certainly was alive at the commencement of the Franco-Sardinian war with Austria; and one of the rumors of the time was, that the French emperor—who, in his young republican days, had been a member of this society—had entered on the war of liberation, to conciliate his old associates, who had menaced him with the fate of a traitor. See MAFFIA, MALA VITA.

CARBONATED or ACID'ULOUS WATERS are those which contain a great excess of carbonic acid gas. The amount of gas in ordinary spring and well waters does not amount to more than 3 to 8 cubic in. in 100 cubic in. of the water; but in waters entitled to be called C., the proportion of gas to 100 cubic in. of water rises 30 to 60, when they are considered rich; 100 to 200 when they are very rich; and in the waters of St. Nectaire it is said that the proportion of gas is as high as 400 volumes to 100 of the

water. These waters sparkle much when poured from one vessel to another. The carbonic acid is free, but is generally accompanied (1) by bicarbonate of soda, when the water is called *carbonated-alkaline* or *acidulo-alkaline*, as in the Seltzer, Pyrmont, Salzbrunn, Altwasser, and Reinerz acidulous mineral springs; or (2) by carbonate of iron, when the water is named *carbonated* or *acidulous chalybeate*. See CHALYBEATE WATERS. The mineral spring at Irkeston, near Nottingham, is the only water of this nature in Britain. The C. or acidulous waters are very refreshing and exhilarating, and are useful in certain disordered states of the stomach; they relieve nausea, and generally increase the discharge of liquid from the system. They are objectionable in the case of persons of a full and inflammatory state of body. See MINERAL WATERS.

CARBONATES, chemical substances which are compounds of carbonic acid with a base; e.g., carbonates of lime, potash, soda, iron, lead, copper, silver, etc. Their formulae are: carbonate of lime (marble), CaCO_3 ; carbonate of potash, K_2CO_3 ; carbonate of iron (protoxide), FeCO_3 , etc. As affinities of carbonic acid are very weak, carbonates are easily decomposed: by heat, as in reducing marble and limestone to lime; by a more powerful acid, as in the preparation of certain kinds of bread, which are made light by the carbonic acid set free from the bicarbonate of soda, the carbonate of potassa, or the carbonate of ammonia, by the acid of sour milk; by the acid tartrate of potash (cream of tartar); by an acid phosphate, prof. Horsford's method; or by hydrochloric acid; or as in the preparation of so-called soda-water, which is merely common water surcharged with carbonic acid set free from marble chips by sulphuric acid.

CARBONDALE, city, Lackawanna co. Penn., near the head of the Lackawanna river, and on the Erie, the Delaware and Hudson, and the New York, Ontario, and Western railroads; 16 miles n.e. of Scranton. The city was incorporated in 1851, and is in the midst of one of the most important coal-mining districts in the state. It is connected with the suburbs by trolley cars, and has electric lights, gas, and a fine system of water-works, machine-shops, car-shops, grist-mills, foundries, high school with library, public library, national bank, and daily and weekly newspapers. Pop. '90, 10,833.

CARBON DISULPHIDE, or BISULPHIDE, also called by workmen sulphur alcohol, a chemical compound produced by burning carbon in an atmosphere of sulphur, or by distilling certain metallic sulphides with charcoal. It is a colorless liquid, of specific gravity of 1.268 and boils at 114°F. (46°C.). It does not combine with water, but readily mixes with alcohol, ether, many oils, and hydrocarbons. It readily dissolves indiarubber, gutta-percha, resins, oils, camphor, phosphorus, sulphur, and iodine, and is very inflammable. With oxygen or atmospheric air it forms an explosive compound. It is of great use in manufacturing in many ways, such as vulcanizing indiarubber, extracting fat from bones, dissolving oil from seeds, removing sulphur and bitumen from rocks, making pure spices, purifying paraffine; also for destroying vermin, producing artificial cold, making photographic light, cleaning greasy rags, preserving hides and fresh meat, and making delicate perfumes. It is also used to some extent in medicines. The odor of the crude article is most sickening. It has a high refracting power, and is used in prismatic glass bottles for producing a spectrum, with an electric or a lime light.

CARBONIC ACID, FIXED AIR, or CHOKEDAMP, is a substance occurring free as a gas in the atmosphere, to the extent of 1 volume to 2,500 of air, and also in combination with a variety of substances. It is most easily prepared for experimental purposes from chips of marble, water, and hydrochloric acid, which are placed in a gas bottle with tubes. The hydrochloric acid, HCl , acts on the marble, CaCO_3 , and forms chloride of calcium, CaCl_2 , water, H_2O , and carbonic acid, CO_2 , which escapes as gas with effervescence, and may be conducted by a proper tube under the mouths of jars filled with water and placed on a pneumatic trough. Where C. A. is required in large quantities, it is prepared in a leaden vessel from chalk, CaCO_3 , and sulphuric acid, H_2SO_4 , diluted with water, when sulphate of lime, CaSO_4 , is formed, and C. A. escapes as gas.

The atomic weight or equivalent of C. A. is 44; it is a clear, colorless gas, with a pleasant acidulous smell and taste. Under great pressure and cold, it can be condensed into a liquid, and even a solid resembling snow in appearance. Under ordinary atmospheric pressure, C. A. dissolves in water to the extent of 2 volumes of gas in 3 of water; but under increased pressure, a very much larger amount of gas is taken up by the water, and in this way the various kinds of AERATED WATERS (q.v.) are prepared. The gas is more than half as heavy again as ordinary air, being 1529. It is incombustible, and a non-supporter of combustion, at once extinguishing a lighted candle, gas jet, or even a piece of burning phosphorus, when these are placed in a jar filled with the gas, or even in a mixture of C. A. and air. This power of putting out flame and fire has been turned to account in the extinguishing of burning coal-mines, where, all the openings to the mine being properly secured, C. A., in the form of the spent air from an ordinary coal-furnace, has been passed into the mine, with the result of successfully stopping the fire. It is irrespirable in a concentrated form, producing spasm of the glottis, which prevents the admission of the gas into the system; and when mixed with air, it can be breathed without suspicion, and then acts as a narcotic poison, even when present only to the extent of 4 or 5 per cent of the air. The deadly effects of C. A. are

observed, in the combustion of charcoal, coal, or *coal-gas*, in chauffers, furnaces, or in fireplaces with the dampers down, when the deadly fumes of C. A. steal more or less quickly over the inmates of the room, and they almost unconsciously become its victims—thus unknowingly following the course of the Parisian suicide, who purposely lights a charcoal fire in the center of his room, and prepares for death; and in overcrowded rooms where the C. A., exhaled from the lungs of each inmate at every breath, poisons the air of the apartment, and day by day slowly but surely robs the robust of health, and ultimately of life. In such cases as the Black Hole of Calcutta (q.v.), where there was scarcely any outlet for the poisonous gas, only a few hours may be required to complete the catastrophe.

Though poisonous when inhaled by the lungs, C. A. is rather refreshing when taken into the stomach. Thus, aerated beverages of all kinds—beer, champagne, and carbonated mineral waters—owe their refreshing and invigorating qualities to the presence of C. A.; and if the gas be allowed to escape, they become almost tasteless, stale, and mawkish.

Besides abounding everywhere in the atmosphere, C. A. is largely evolved from fissures in the earth, especially in volcanic districts. In the *poison or Upas valley* of Java, which is a valley of an oval form, about $\frac{1}{4}$ of a mile in circumference, and 30 to 35 ft. deep, the carbonic rises to a height of about 18 ft. from the surface, and the whole bottom of the valley is devoid of vegetable and animal life, and is strewn here and there with the bleached bones of man and other animals that have unluckily stepped within the deadly circle. A dog thrown in dies in 14 seconds; and birds attempting to fly across the valley, instantly drop down dead. In the neighborhood of the lake of Laach, in Rhenish Prussia, the amount of C. A. evolved every day has been estimated at 600,000 lbs. weight. In a state of combination, C. A. forms an ingredient in a great number of minerals called *carbonates*, such as chalk, limestone of various kinds, CaCO_3 , black-band iron-stone (carbonate of iron, FeCO_3), malachite (carbonate of copper, $\text{CuO}, \text{H}_2\text{O} + \text{CuCO}_3$), etc. C. A. is the principal product of combustion; the carbon of the burning substance (coal, candle, coal-gas, wood, paper, etc.) uniting with the oxygen of the atmosphere, and forming C. A. (CO_2). It is also a product of respiration (q.v.), and is evolved more or less largely by all animals, not only by the mouth, but in exhalations from the skin, and is present in blood, urine, etc. It is evolved during the fermentation (q.v.) of beer, wine, etc., and often remains in brewers' vats when the liquor has been drawn off. During the decay of vegetable and animal matter, C. A. is produced, and in explosions of fire-damp in coal mines, it is formed in large quantity, and fills the underground passages.

C. A. forms the largest ingredient in the food of vegetables, and is therefore abstracted in large quantity from the air by plants. It enters into combination with the majority of the oxides of the metals and other compounds, to form a class of salts called *carbonates*, several of which have been referred to. C. A. when present in a vessel in quantity may be recognized by the power of extinguishing a lighted candle, or by not burning itself. C. A. in the form of gas may be readily recognized in the atmosphere by exposing a little lime-water in a saucer, or other shallow vessel, when the lime, CaO , abstracting the C. A. (CO_2) from the air, a white film of carbonate of lime or chalk, CaCO_3 , is formed on the surface of the liquid. A solution of baryta (q.v.) in water is more delicate in its action on the C. A. of the air, and more readily indicates its presence.

CARBONIC OXIDE is a compound of one atom of carbon and one atom of oxygen, is represented by the symbol CO , and has the atomic weight 28. It does not occur naturally, but may be observed burning with a pale-blue flame in fireplaces and stoves, especially in frosty weather. During the combustion of the fuel at the lower part of the grate, the oxygen of the air unites with the carbon of the fuel to form carbonic acid, CO_2 ; and this gas rising up through red-hot coal or carbon, C, has part of its oxygen abstracted by the carbon, and two atoms of C. O. (CO) are produced, which, taking fire on the top of the coals, burn with the characteristic blue flame, abstracting more oxygen from the air, and re-forming carbonic acid, CO_2 . C. O. can be prepared for experimental purposes by heating a mixture of oxalic acid, $\text{H}_2\text{C}_2\text{O}_4$, and sulphuric acid, H_2SO_4 , in a retort, when the latter abstracts the water from the oxalic acid, and the other elements, C_2O_3 , escape as carbonic acid, CO_2 , and C. O. (CO). On passing the mixed gases through a solution of potash, K_2O , the carbonic acid is retained as carbonate of potash, K_2CO_3 , whilst the C. O. remains as gas. C. O. is a transparent, colorless gas, a little lighter than air, being 967, and has recently been liquefied and solidified. It burns with a blue flame, but is a non-supporter of combustion, and at once extinguishes a lighted candle introduced into it. It is very poisonous, and even when largely diluted with air, if inhaled, it produces a sensation of oppression and tightness of the head, and ultimately acts as a narcotic poison. It does not take part in any natural phenomena, nor is it put to any use in the arts and manufactures, and in these respects, affords a striking contrast to carbonic acid, which has so many duties to perform in nature and in the arts.

CARBONIFEROUS LIMESTONE, or **MOUNTAIN LIMESTONE**, one of the lower rocks of the carboniferous system, generally of coralline formation, containing magnesia, and rich in organic remains. Some varieties make good building stone.

CARBONIFEROUS SYSTEM, the name given to the strata which, in geological order, rest upon the Devonian measures, and are capped by the Permian series. They derive their designation from the amount of carbon contained in them, for to them the great coal-fields of the world belong. In an economic sense, they are the most valuable series of rocks in the earth's crust, forming the great store-house from which is obtained the chief supply of coal, iron, and lime.

The rocks of the system are composed of a vast series of beds of sandstone, limestone, shale, and coal. In some coal-fields, these are so interstratified, that it is impossible to subdivide the strata in the order of time. In the Edinburgh district, there are nearly 100 coal-seams, omitting all under 6 in. in thickness. Out of the whole depth of the strata, amounting to about 6,300 ft., these seams occupy only 204 feet. The remainder consists of sandstone and shale in the upper half; towards the middle, limestones appear, and these increase downwards in the number and thickness of the beds, but are still intermixed with seams of coal. The same arrangement exists in the other coal-fields of Scotland, as well as in those of the n. of England. In other districts, the limestone is confined to the lower portion of the measures, and separated from the coal-bearing strata, so as to form a natural subdivision of the system into—1. *The coal measures*, consisting of shale, sandstone, and grit, with occasional seams of coal; and 2. *The mountain or carboniferous limestone*, a calcareous rock, containing marine shells and corals, and devoid of coal. A coarse quartzose sandstone, passing into conglomerate, is occasionally developed to a considerable extent between these two divisions. This is a local deposit, being almost confined to England, and may be considered as one of the coal sandstones, of coarser texture than usual. Being occasionally used for millstones, it is called *millstone grit*. It is accompanied with shales containing the usual coal plants, but generally without any true coal seams. Another locally developed series of beds, consisting of indurated shales, sandstones, and grits, occurs below the carboniferous limestone in South Wales and Ireland, and is known as the *lower limestone shales*. These rest conformably on a series of yellow sandstones, which have been generally referred to the Devonian measures, but which, from their organic contents, as well as from their stratigraphical position, seem to be basement beds of the carboniferous series. The existence and development of these various beds in the United Kingdom will be better understood by an examination of the following table. The maximum thickness of the beds is given in feet when known; the blanks show the absence of the division from the particular coal-field:

	Edinburgh.	Glasgow.	N. York.	Derby.	S. Wales.	Kerry.	Clare.	N. Ireland.
Coal Measures.....	6,300	2,800	2,000	2,700	12,000	2,000	2,000	2,200
Millstone Grit	400	1,600	1,000	1,800
Mountain Limestone	1,659	1,000	1,500	1,500	3,000	6,400
Lower Limestone Shales	500	4,650	150	1,200
Yellow Sandstone	3,000 unknown depth	2,000

In the midland countries, the coal measures are the only portion of the C. S. present, and these rest on the Silurian or older rocks. In Devonshire, there occurs an extensive series of shales and sandstones, with a few beds of earthy anthracite or culm, associated with argillaceous rocks, probably belonging to the lower limestone shales, much indurated, and traversed by slaty cleavage.

From the great economic value of the contents of the C. S., we are better acquainted with its fossils than with any fauna or flora that flourished before the tertiary epoch. As coal is the result of the mineralization of vegetable matter, the coal measures must necessarily abound in the remains of plants. No less than 294 species have been described as found in Britain alone. Numerous impressions of plants, as well as traces of structure, are found in the seams of coal themselves; but the more distinct forms are preserved in the interstratified beds of mud and ironstone, often in great number and exquisite beauty. Such remains consist chiefly of impressions of leaves separated from their branches; of casts of trunks, more or less in a broken state; and of roots much compressed, yet occupying their original position in the clay soil now indurated into shale; with these occur pieces of wood, or remains of trees, in which the vegetable texture is to some extent preserved. The great proportion of the plants seem to have flourished in marshy swamps, and to have accumulated where they grew, like peat, the material afterwards converted into coal. Hence a stratum of shale in which are imbedded the roots of sigillaria, calamites, etc., is the invariable *floor* on which the coal seam rests. The chief coal plants are lepidodendron (q. v.), sigillaria (q. v.), calamites (q. v.), trigonocarpon (q. v.), and ferns (q. v.). The existence of cone-bearing trees during this epoch has been proved from the microscopic examination of prepared sections of fossil woods, in which the small discs occur that are characteristic of and peculiar to the coniferæ. See *illus.*, COAL AND ROCK SALT, vol. IV.

The animal remains are as numerous and as well preserved as the vegetable. They are found chiefly in the limestone; the greater part, indeed, of this rock, is made up bodily of corals and crinoids. No other such accumulation for extent and variety is known; it has its nearest parallel in the somewhat similar formation now going on in the southern archipelago. The corals and crinoids were specifically as well as individually numerous. The terebratulæ and other allied forms of bivalve shells, though belonging to a comparatively limited number of genera, were very abundant. The more highly developed mollusca were also numerous; they belonged to a great number of

generic types. But the most remarkable group was the fishes. At no time were they more abundant. They belonged to the ganoid and placoid groups of Agassiz. The ganoids, having their entire surface covered with scales, were numerous; some of them inhabited shallow water near the shore, and fed on crustaceans and shell-fish, for crushing which they had a formidable apparatus of conical teeth of a very complicated structure. Others were inhabitants of deep water, and were more powerful and predaceous, and more rapid in their movements. Their jaws were produced into a long snout, like the crocodile of the Ganges, and armed with a double series of enormous teeth, which were sometimes as much as 4 in. long by 2 in. broad, as in *megalichthys* (q.v.), dimensions rarely attained even by the largest known reptiles. Associated with these were a great number of sharks belonging to the *cestraciontidae* (q.v.), a family of which we have only a single living representative. They were furnished with a long bony spine to strengthen the dorsal fin, and thus enable them to turn speedily in the water, as they required to do in seizing their prey. These spines are often found fossil. The only remains referred to a higher division of the animal kingdom yet found belong to the *saurian archegosaurus* (q.v.). The larger part of the great coal fields of the world belong to this system of formation. In this country, coal is widely distributed over Pennsylvania, Ohio, Illinois, Kansas, Virginia, and other states. It is estimated that there are 400,000 sq. m. of the earth's surface now covered by productive coal fields. Now as there are about 3,100,000 sq. yards in a m., and as a cubic yard of coal weighs nearly a ton, and as in some of the fields the vein or deposit is from 30 to 60 ft. thick, there would not seem to be any immediate danger of failure in the supply of coal. See **ANTHRACITE**, and **COAL**.

CARBON PRINTING. See **POSITIVE PRINTING**.

CARBOY, a large glass bottle, cased in wicker, or protected by a wooden box, used to contain acids or other corrosive liquids, such as sulphuric acid (oil of vitriol). A carboy of sulphuric acid contains about 160 pounds of that acid.

CARBUNCLE, a name given by lapidaries to the beautiful mineral called *pyrope* (q.v.) by mineralogists. The C. of the ancients appears to have been either pyrope, or the deeper variety of noble garnet (see **GARNET**), which is in every respect very similar to it, or probably included both.

CARBUNCLE (Lat. *carbunculus*, a little coal) derives its name from the two prominent symptoms—a glowing fiery redness, and a burning pain. It consists of an inflammation, caused by some vitiated condition of the blood, or some atmospheric influence, attacking a patch of skin on the shoulders, nape of the neck, or indeed on any part of the body. The part swells slightly, feels hard, and this hardness extends deeply into the tissues; the pain is very severe, and the patient much depressed with loss of appetite, and general derangement of the secretions. As the disease advances, the redness assumes a dark purple or livid hue, the cuticle rises in blisters, and many small specks of matter appear on its surface, which discharge, and leave apertures like those in the rose of a watering-pot; through this a thin viscid fluid escapes, and occasionally a small slough or core of the true skin which has been killed by the disease. Sometimes these apertures meet, forming large openings, and in others the whole patch of skin sloughs and comes away.

The treatment of C. consists in restoring the secreting organs to a healthy condition, the agents for which must depend on the individual case; in supporting the patient's strength by easily digested food, wine, brandy and bark, with nitric acid; relieving pain by opiates, and encouraging suppuration with warm poultices; carrot, turnip, and yeast poultices being favorite applications in this disease. To prevent excessive loss of skin, the C. must be divided freely with a knife from one margin of the inflamed patch to the opposite one.

CARBURETS. See **CARBIDES**.

CARBURETED HYDROGEN is a term in chemistry applied to several compounds of carbon and hydrogen. Thus, light carbureted or monocarbureted hydrogen, CH_4 , is the gaseous compound popularly known as marsh gas and fire-damp, and is the principal constituent of coal-gas. See **GAS**. Heavy carbureted or bicarbureted hydrogen, C_2H_4 , is otherwise known as olefant gas (q.v.).

CARCAGENTÉ, a t. of Valencia, Spain, about 28 m. s.s.w. of the city of Valencia, situated on a rich plain near the right bank of the Juncar. It is well built, with good streets, and has a palace belonging to the marquis of Calzada. It has some manufactures of linen and woolen, and a trade in the agricultural produce of the district. Pop. about 12,500.

CARCANET, a jeweled chain or necklace. Venice was famous for the manufacture of carcanets in the 15th century.

CARCASS, in military pyrotechny, is a hollow case of iron, sometimes globular, and sometimes ovate, filled with combustibles. It is fired from a mortar. Its chief use is to ignite buildings in the enemy's quarter, and to give sufficient light to aim the shot and shells. Carcasses are said to have been first used by one of the princely ecclesiastics of Germany, the bishop of Munster, when he fought against the duke of Luxem-

bourg at Groll, in 1672. The oval carcasses, being uncertain in their flight, are now nearly abandoned.

Carcasses are not intended to burst, but to send out, through holes, a furious and inextinguishable fire, which lasts from 3 to 12 minutes. The composition with which they are filled consists of saltpeter, sulphur, meal gunpowder, pitch, rosin, tallow, and Venice turpentine, about half being saltpeter. The composition is packed in tightly through one of the holes; and the holes are stopped with fuses adjusted to ignite the composition after a certain space of time. Sometimes old pistol barrels, loaded to the muzzle, are introduced with the composition. Compare those details with CASE-SHOT, and SHELLS.

CARCASSONNE, a t. in the department of Aude, France, situated on the river Aude, and the *Canal du Midi*, about 55 m. s.e. of Toulouse.* It is divided into two parts, the old and new towns. The modern town is well built, with streets running at right angles to each other, squares adorned with trees, pleasant boulevards, and several marble fountains. The old town, built on a height, is much more picturesque, with its ramparts and towers, some parts of them dating from the time of the Visigoths, and the rest, with the castle, from the 11th or 12th century. This old town suffered greatly at the hands of the fierce bigot Simon de Montfort and his crusaders, who here burned 400 of the Albigenses. In the 14th c. it effectually resisted the black prince. The cloth manufactures are important, employing a large number of operatives. C. has also manufactures of paper, leather, linen, and soap. Pop. of commune, '91, 28,235. The ancient name of the town was Carcaso, which was a place of some note in the time of Cæsar.

CARCHARIAS. See SHARK.

CARCHEMISH, an ancient city frequently mentioned in the Scriptures as the capital of the Hittite nation. Biblical scholars were formerly inclined to look upon it as the classical Circesium, but recent Assyriological investigations have identified it with the modern Jerablûs or Jerablîs, a village on the Euphrates river not far from Biredjek. The period of its greatest splendor was abt. B.C. 1100-850. It seems to have been the birthplace of that modified type of Assyrian art which specially characterizes the early monuments of Asia Minor.

CARCINOMA. See CANCER.

CARDAMINE. See CRESS, BITTER.

CARDAMOMS are the capsules of certain species of plants of the natural order *scitamineæ* (q.v.), and belonging to at least two genera, *amomum* and *elettaria*. They are three-celled, and contain numerous wrinkled seeds, which form an aromatic pungent spice, weaker than pepper, and with a peculiar but agreeable taste. On account of their cordial and stimulant properties, they are employed in medicine, very generally to qualify other medicines; they are also used in confectionery, although not to a great extent in Britain; but in Asia they are a favorite condiment; and in the n. of Germany, they are used in almost every household to flavor pastry.—The C. recognized in the British pharmacopœias, and called *true* or *official* C., also known in commerce as *Malabar C.*, are the produce of *elettaria cardamomum*, a native of the mountains of Malabar and Canara. They depend for their qualities on a peculiar pungent essential oil, called *oil of cardamom*, which may be obtained from them by distilling them with water, and when fresh, is colorless. Other kinds of C. occur in commerce, but none is equal to the true C. in commercial value. The different kinds of C. differ not only in strength, but in the character of their aroma. The plants producing them have much general similarity.

CARDAN, JEROME, a celebrated mathematician, naturalist, physician, and philosopher, b. at Pavia, Sept. 24, 1501, was the illegitimate son of a physician and jurisconsult at Milan. He received his early education at home, and completed his studies in Pavia and Padua. After some years, he became professor of mathematics at Milan. Here his reputation began to grow. After a few years, he began to lecture on medicine, to the practice of which he ultimately betook himself. By 1546, his reputation had so increased, that he was invited by the king of Denmark to accept a professorship at Copenhagen, which, however, he declined; and, in 1552, we find him proceeding to Scotland, on an invitation from Hamilton, primate of that country. He managed to cure the primate of an inveterate asthma, which had defied the skill of the most celebrated physicians, and returned to Milan enriched by the bounty of his patient. Here he again settled for some time. In the autumn of 1559, however, he removed to Pavia as professor of medicine, whence, again, in the same capacity, he removed to Bologna, where he continued teaching till 1570, when we find him imprisoned for debt. Having regained his liberty in 1571, he went to Rome to avoid his creditors. Here he was speedily admitted a member of the medical college, and pensioned by pope Gregory XII. The rest of his life he spent, without public employment, in Rome, where he died Sept. 2, 1576, a few weeks after finishing his autobiography. Some writers assert, but on no sufficient authority, that he starved himself to death, to fulfill a prediction which he had made as to the time when he should die. It is certain, however, that he was a devoted astrologer, and cast horoscopes for himself and others. The fancifulness necessary to

support the faith of an astrologer imbued all his scientific writings. These were very voluminous. A summary of his notions on physics and metaphysics is given in his two works—*De Subtilitate*, in 21 books, and *De Rerum Varietate*, in 17 books. On the whole, he wrote 122 treatises on physics, mathematics, astronomy, astrology, rhetoric, history, ethics, dialectics, natural history, music, and medicine. These, it need scarcely be said, abound in incoherent paradoxes, contradictions, and capricious abstractions, more than enough to overwhelm the few profound ideas which he originated. A formula for the solution of certain kinds of cubic equations is called "Cardan's formula," and was published by him, as his own invention, in the *Ars Magna sive de Regulis Algebraicis* (1545); but it would appear that the formula was really the invention of one Tartalea or Tartaglia. In religion, C. was heterodox, and commonly reputed an atheist. His numerous writings were collected and edited by Charles Sphon (10 vols., Lyon, 1663).

CARD-BOARD, or **CARD**, is made by pasting together several layers of paper, according to the thickness and quality required. *Bristol-board*, used by artists, is made entirely of white paper; ordinary card-board, of fine white paper outside, with one or more sheets of coarse cartridge-paper between. According to the number of layers, they are called *three, four, six, or eight sheet boards*. *Mill-board*, used by book-binders as the basis of book-covers, is made of coarse brown paper, glued and strongly pressed.

The workman arranges the paper in the order required for pasting, and the pile, called a *head*, is placed at his left hand, the paste-tub on his right. He lifts a sheet from the head with his left hand, brushes it over with paste with his right; then another is laid upon that and pasted, until he comes to the last required to complete the thickness of one board, when he removes two sheets, and only pastes the upper one, which thus forms the lower sheet of another board. This is repeated till the whole head is pasted, when it is removed to a press, and the water of the paste squeezed out at the edges. The boards are then separated, and dried by hanging them in a room artificially heated. The card-board, which is now rough and warped, is smoothed and flattened by making a pile consisting alternately of sheets of rough card-board and copper plates, with a copper plate at top and bottom. This pile is passed between iron rollers, and the smooth surface of the copper impressed upon the card-board, which is thus flattened and beautifully polished.

The enameling of address-cards is produced by brushing over the card-board a mixture of *china* or *kremnitz white* (a fine variety of white lead) and size. After drying, this surface is rubbed lightly over with a piece of flannel, previously dipped in finely powdered talc; it is then polished by rubbing vigorously with a hard, close-set brush.

CAR DENAS, a seaport and city of Cuba, capital of a district, 105 m. e. of Havana, on a bay of the n. coast, and having railroad communication with Matanzas and Havana. There is a good anchorage in the harbor. Sugar is the chief article of export. The streets are well laid out and lighted, and the houses are usually neat and solid. There is a bronze statue of Columbus in one of the squares. Much of the business is done by people from the United States, a fact that gives it the name of the "American city." In 1850, the city was plundered by Narciso Lopez (q. v.). Pop. '92, 23,680.

CARDIA, the upper orifice of the stomach, called, on account of its vicinity to the heart, by the same Greek name, *cardia*, and probably hardly distinguished from it in the earliest times of Greek medicine.

CARDIAC MEDICINES, stomachic and stimulating remedies—cordials, so called from their action on the heart through the stomach. See **CARDIA**.

CARDIADÆ, a family of bivalve lamelli branchiate mollusks, of which the cockle is a specimen.

CARDIALGIA, pain of the heart or stomach (**CARDIA**). The name is commonly applied to the particular variety of pain called *heartburn*, arising from a disordered stomach, and accompanied with acid eructations. See **INDIGESTION**.

CARDIFF (*Caer-Taff*, Fort of the Taff), a parliamentary and municipal borough and seaport, one of the county towns of Glamorgan, South Wales, situated on the river Taff, 170 m. w. of London by railway. The population, which was about 1,000 in 1801, was estimated at 162,690 in 1896. C. with Cowbridge and Llantrissant, returns one member to parliament. The town extends about one mile in each direction from the town-hall. Among the public buildings are the Glamorganshire and Monmouthshire infirmary, town-hall, free library and museum, county jail, law-courts, an infirmary, a county lunatic asylum, baths, and a theater. There are also many private buildings of a superior character, and a public park. Of the numerous places of worship in C., only a few belong to the church of England. South Wales College is at C.

The port of C. is the outlet for the large mineral and manufactured produce of the central portion of the South Wales mineral-field, in which are the populous districts of Merthyr-Tydvil, Rhymney, Aberdare, and the Rhondda valley, with which this port is connected by the Taff Vale, the Rhymney, and the Ely Valley railways, and the Glamorganshire canal. The town is also one of the chief stations on the Great Western line from London to Milford-Haven. The Bute docks, e. and w., with an area of 76 acres, constructed at the expense of the Bute estate, have cost upwards of a million sterling.

There are several other docks and basins in addition to a floating dock with a lifting power of 4,500 tons and many dry docks. Since the '60's the progress of the town has been very rapid, owing chiefly to the trade in the steam coal obtained in the vicinity. The export of coal for the coasting trade increased from 899,000 tons in 1865 to nearly 1,300,000 tons in 1891. In the same years the export of coal to foreign countries increased from 1,451,000 tons to 10,115,000 tons. There is a considerable trade in iron and tin plate and the city has iron shipbuilding works, extensive iron and steel plant and many factories.

The assizes (half-yearly, alternately with Swansea) and the quarter-sessions are held at the town-hall. The ancient city of Llandaff, now a mere village, is almost connected with Cardiff. Cardiff castle, built in the 11th c., is now partly in ruins and partly occupied by the marquis of Bute, to whom nearly the whole of the modern town belongs. Robert duke of Normandy, brother of Henry I., died in the castle after being a prisoner for 28 years.

During the Civil War Charles I. visited Cardiff and the castle was alternately in the hands of the royalists and the parliamentarians. In 1648 Cromwell got possession of it after a bombardment lasting three days, and he afterward, as an example to his soldiery, hanged the man who had betrayed the city to him. In the latter part of the 17th century the inhabitants of Cardiff complained very much of the competition of the neighboring town of Caerphilly, but the latter soon decayed, while Cardiff advanced in prosperity. Yet at the beginning of the 19th century it had a population of only about 1,000. The transportation was carried on in a very primitive manner and only vessels of small tonnage could enter the port. The opening of the Glamorganshire canal greatly advanced the commercial prosperity of the city, but a still greater impetus to progress was the construction of the docks and basins.

CARDIFF GIANT, a rude statue of a man 10½ ft. high, cut (in Chicago) from a block of gypsum sent from Iowa. It was secretly buried near the village of Cardiff, Onondaga co., N. Y., where it was pretended to have been found in Oct., 1869, and was exhibited with great success for several months as "the petrified giant," deceiving even some men of science. The fraud, one of the most notable in recent times, was finally confessed.

CARDIGAN (anciently, *Aberteifi*, Mouth of the Teify), the co. t. of Cardiganshire, a parliamentary and municipal borough and seaport, in the s. w. corner of the county, on the right bank of the Teify, 3 m. from its mouth, and 239 m. n. by w. of London. The vicinity exhibits romantic scenery on the Teify, and grand rocks on the coast. The streets, except the chief one, are narrow and steep, the houses built of slate-rock. Population of the municipal borough in 1891 was 3447. With Aberystwith, Lampeter, and Adpar, C. returns one member to parliament. Vessels of 400 tons reach the town by spring-tides. C. became an important town about the Norman conquest. The Normans were frequently defeated before mastering it. There are the remains of a castle on a low cliff on the Teify, which is supposed to have been founded, in 1160, by a Norman baron. The town suffered much in the struggles between the Welsh and the Normans. The Teify is said to have been the last British resort of the beaver.

CARDIGAN, JAMES THOMAS BRUDENELL, 7th earl of; also baron Brudenell, lieut.gen.; 1797-1868. He was educated at Oxford, and went into parliament in 1818. In 1824, he entered the army in the hussars, and rose (1832) to be lieut.col. He was overbearing and quarrelsome, and treated his men with great severity, so that out of a regiment of 350, he made within two years 700 arrests, and held 105 courts-martial. In 1837, he succeeded to the peerage. In 1840, he fought a duel with Capt. Tuckett, an officer of his regiment, in which his adversary was wounded. The house of lords subjected the earl to a show of trial, and he was acquitted. The Crimean war sent him to the field as commander of the light cavalry, and he led that body of 600 through the desperate charge at Balaklava, cutting his way through six times the number of Russian heavy cavalry, but leaving half his men dead or wounded on the field. This charge, celebrated in Tennyson's poem, was desperate and brilliant work, but in the opinion of many critics a wanton and needless sacrifice of his men. In 1861, he was made lieut.gen. He left no children, and the titles passed to his relative, the marquis of Ailesbury.

CARDIGAN BAY, a semicircular bend of St. George's channel, on the w. coast of Wales, 45 m. wide from n. to s., and 20 m. deep, with a sweep of coast of 110 miles. Its exterior points are Brach-y-Pwll, off which lies Bardsey isle, in Caernarvon, and Sturm Head, in Pembroke. It receives the rivers Mawddach, Dovy, Ystwith, Yren, and Teify. It has 3 to 30 fathoms water, with three reefs. A strong current sweeps round the bay from s. to north. Almost all the harbors on the coast are obstructed by bars. A great part of C. B. is said to have been once dry land, protected, as Holland now is, by dams and dikes, and containing 16 towns, and the land is said to have been submerged about 520 A.D.

CARDIGANSHIRE, a maritime co. in South Wales, on Cardigan bay, with an area of 692 sq.m., a half being waste. The surface is hilly, interspersed with fertile valleys. A rugged, bleak range of hills runs through the middle of the co., from the s.w. to the n.e., between the coast and the Teify, ending abruptly in a shelving beach in the middle

of the coast, but on other parts there are rich flat tracts. The co. contains little wood. The chief rivers are the Teify, which rises in a small lake near the center of the co., and runs 79 m. s.e. and e. along the s. border of the co., the Claerwen, Ystwith, and Rheidol. C. contains some romantic water-falls, especially the Rheidol falls and the Devil's bridge, and above 20 small lakes or llyns, noted for their wild beauty. C. reposes on lower Silurian slates and shales, containing few or no organic remains. Rich veins of copper, lead, zinc, and silver occur. The climate is cold and wet, but mild though wet on the coast. Snow lies long on the hills in winter. Summer is delightful in the valleys. C. is an agricultural co., and its chief branch of industry is the rearing of live-stock. The chief crops are oats, barley, and potatoes on the poor clay and peat soils of the mountains, and wheat, barley, and potatoes on the flat loams of the coast and valleys. The cattle and horses are small. There are some manufactures of coarse woollens and gloves, stockings, and hats. Oats, barley, cattle, sheep, pigs, butter, slates, and woollens are exported. Cardigan is the co. town; the other chief towns being Aberystwith, Lampeter, Adpar, Aberayron, Tregaron. C. sends one member to parliament. Pop. '71, 62,712; in '91 it was 63,467. In 834, the king of C. became king of all Wales, under the title of Roderick the great. He divided Wales among his three sons. After this, the Danes and Normans overran Cardiganshire. The co. has many remains of British and Roman camps and roads, Druidical circles, cairns, and castles. Many Welsh princes and bards were buried in the abbey of Strata Florida, 16 m. s.e. of Aberystwith, and some of the records of the principality were kept here. In C. there is a curious practice of sending presents (*biddings*) to a new-married couple, which, when sold, often realize £50 or £60.

CARDINAL (Lat. *cardinalis*, principal, from *cardo*, a hinge). Cardinals are the highest dignitaries in the Roman church after the pope, whose electors and councillors they are. The title, however, had at first a more general application. The pope being the sovereign bishop over the whole Romish church, and having, as such, many duties to fulfill inconsistent with those of a particular diocese, had, from very early times, a number of bishops, priests, and deacons whom he appointed his vicars and coadjutors for the management of the diocese of Rome. The bishops exercised the episcopal function in the pope's stead, each having a peculiar church within the diocese. The priests were titular parsons of the churches in the city of Rome, and had the cure of souls. The deacons had charge of some churches and chapels of devotion, which they held as deaneries, with the additional duty of assisting the pope when he officiated in public. These three classes of ecclesiastics were called *cardinati* or *cardinales*, to denote that they were the first or chief over the rest, and that all the affairs of the diocese of Rome were under their direction. At a subsequent period, the priests and deacons of other cities of importance assumed the title of C., to distinguish them from other priests and deacons over whom they claimed supremacy; but the popes subsequently ordained that none but those whom they had chosen should be honored with that title. Amongst those whom the popes thus appointed were the seven bishops *suburbicarii*, who took their titles from places in the neighborhood of Rome. These bishops were called *hebdomadarii*, because they attended the pope for a week each in his turn. These cardinals took part with the Roman clergy in the election of the pope, who was generally chosen from their number. About the beginning of the 12th c., the popes having formed a regular court, began to bestow the rank of C. priest or C. deacon on any individual of the clergy, or even of the laity, whom they chose to select; and to each, whether Roman or foreign, they gave the title of some particular church in Rome, but without attaching to it any obligatory service. Thus the cardinals became a separate body elected for life and the officiating priests of the Roman parishes were gradually deprived of the title. In 1159, Nicholas II. limited the right of election to the popedom to the cardinals thus appointed, leaving to the rest of the clergy and people of Rome merely the right of approving of the election of a new pope, and to the emperor that of confirming it. Even these prerogatives, in course of time, were withdrawn. Notwithstanding the great powers thus intrusted to them, the bishops in the great councils of the church continued to take precedence of the cardinals; and it was not till 1614 that Louis XIII. of France, in the sitting of the parliament of Paris, adjudged precedence to the cardinals over the ecclesiastical peers—bishops and abbots. The power of the popes to appoint cardinals has often been contested, and their right to precedence denied, by the other dignified ecclesiastics. In 1567, pope Pius V. forbade any clergyman not appointed by the pope to assume the title of C.; and Sixtus V., in Dec., 1586, fixed their number at 70—viz., the 6 bishops *suburbicarii*, 50 priests, and 14 deacons, and on this footing they have since remained, though the number is seldom complete, the pope generally leaving some vacancies for extraordinary cases. The number has frequently fallen greatly under 70. When Nicholas III. was chosen pope, there were but eight cardinals; and a little before the death of Alexander IV., there were but four. Sometimes before Sixtus V. the number was exceeded, as in the pontificate of Pius IV., when there were 74. The body of cardinals is styled the sacred college. Most of the cardinals reside in Rome, and either enjoy ecclesiastical benefices, or are employed in the administration. When not so provided for, the cardinals receive an allowance of 100 dollars monthly from the papal treasury. Some cardinals belong to monastic

orders, and reside in their convents even after their election. The jurisdiction of the C. bishops in the place in which they are established is truly episcopal, but they are not obliged to reside. That of the C. priests and deacons is almost episcopal, but extends no further than the church and sacristy. They have there an episcopal seat under a canopy, like bishops, and they there solemnly give the people their blessing. The creation of cardinals is wholly in the pope. If the new-created C. is at Rome, he goes the same day to visit the pope, who puts the red cap on his head. The red hat, which Innocent IV. ordained that cardinals should wear, to show that they ought to expose themselves to the shedding of their blood in the cause of the church, is afterwards given in a public consistory. A number of symbolical ceremonies accompany this investiture. The cardinals that are absent, when chosen, have the cap sent them by a special messenger from the pope. The hat is given by the pope's own hands; and many cardinals who do not visit Rome, die without ever having received it. The only exception is in favor of members of royal houses, to whom the hat is sent. Pope Urban VIII., in 1630, gave to the cardinals the title of eminence, which they shared with the grand-master of the order of Malta, and the ecclesiastical electors of the German or Roman empire. The pope often employs cardinals as ambassadors, and the individual thus employed is styled *legate a latere*. A C. legate acts, or recently acted, as governor of the northern provinces of the Papal states, which thence received the name of legations. The chief secretary of state, the *camerlengo* or minister of finances, the vicar of Rome, and other leading officials, are always chosen from among the cardinals. The council of cardinals, when assembled under the presidency of the pope to discuss matters of church and state, is called the consistorium. There are public consistories, which are held on great occasions, and correspond to the levees of other sovereigns; and private and secret consistories, which are the privy council of the pope. Moreri's *Dictionary*, *voce Cardinal*, contains a list of cardinals from 1119 to 1724, with their names, countries, etc., and the dates of their election and death. See *illus.*, PRIESTS, MONKS, AND NUNS, vol. XII.

CARDINAL BIRD, or **RED BIRD**, *Guarica cardinalis*, also called cardinal finch, cardinal grosbeak, and Virginian nightingale, one of the finest song-birds of America, belongs to the family of *fringillide*, and differs from the true grosbeaks (*coccothraustes*) in having the beak slightly bulging. The general color of the male is red, the head being vermilion, and only a small portion of the plumage around the base of the bill being black. The feathers of the crown are long, and erected into a conical crest, like a red cap. The C. B. abounds in Texas, Florida, and the southern states of America generally, migrating northwards in spring, but never further than Massachusetts, where only a few stragglers are seen. Its loud, clear, sweet, and varied song is to be heard chiefly in the mornings and evenings.

CARDINAL FLOWER. See **LOBELIA**.

CARDINAL NUMBERS; **CARDINAL POINTS**, **CARDINAL SIGNS**, **CARDINAL WINDS**. The numbers which answer the question, "How many?" i.e., one, two, three, etc., are C. *numbers*. The C. *points* of the horizon are the N., S., E., and W. points; the two former are the points in which the meridian cuts the horizon near the north and south poles of the heavens respectively; the two latter those in which the prime vertical cuts the horizon near the points where the sun rises and sets respectively. The C. *signs* of the zodiac are Aries, Libra, Cancer, and Capricorn. The C. *winds* are those which blow from the C. points of the horizon.

CARDINAL VIRTUES (Lat. *cardinalis*, chief, from *cardo*, a hinge). The C. V. of the ancients were justice, prudence, temperance, fortitude. They were so called because the whole of human virtue was supposed to hinge or turn upon them. In other words, they were considered as a full and comprehensive classification of man's various duties.

This mode of dividing the virtues is to be found as far back as Socrates. The ancient moralists treated under ethics the whole sum of human duty and virtue. Thus, Aristotle considers the great problem of the science to be the determination of man's highest good, together with the means of realizing it. Hence, he includes both the social virtues and the prudential regard to the welfare of the individual in the same scheme. Of the four C. V., it will be seen that the first, justice, is the social virtue; that prudence (which, properly speaking, includes temperance also) regards the well-being of the individual; while fortitude is necessary to both. This last was a virtue greatly esteemed in the ancient world, each one's lot being much less secure than with us in the present day; it was impossible to say what sufferings might be in store for the most prosperously situated of men.

Dr. Whewell has made an attempt to correct the more obvious defects of the classification, and has substituted one which he deems free from those defects. The most notable omission, in the ancient scheme, judged from the modern point of view, is the absence of all reference, either expressly or by implication, to the virtue of goodness or benevolence.

Accordingly, to adapt the classification to the altered point of view, benevolence has to be added to the list. This is Dr. Whewell's first virtue; the others are justice, truth, purity, and order. But the scheme, as thus amended, is scarcely less objectionable than before. The virtue named last, order, which means obedience to authority, cannot but

contain a very large portion of all the rest; seeing that justice, truth, etc., are enjoined by positive law. Then, what is understood by purity, including the control of the two powerful appetites, hunger and sex, is partly prudential and partly social.

The ethical discussions of modern times may be very much aided, if we divide the totality of human virtue on the following plan. There are three distinct classes of human actions, which are all approved of or accounted virtuous, but on different grounds, and in a different manner.

1. There are actions which are forbidden by society under penalties; in other words, men are punished for committing them. Such are theft, breach of bargain, slander, violence to the person, and all the offenses against our fellow-men that are prohibited by the law of the land. The avoiding of all these actions is signified to be a part of our duty, by the suffering inflicted on the doers of them. The law fines, imprisons, or puts to death those who will not conform to its regulations.

The law of the land is not the only power that prescribes conduct enforced by penalties. The public opinion of the country at large forbids certain actions, and punishes transgressors by excluding them from social intercourse; such, for example, are acts of unchastity, more especially when committed by women. There are also codes enacted by particular societies, as the code of honor among gentlemen, which constitutes some actions offenses that are not so by law, or by universal opinion. Cowardice is one of the qualities most obnoxious to the code of honor.

The actions prohibited by law are obviously such as could not be allowed without the entire subversion of human society. If murder and theft were to go unpunished, the principal end for which men associate together in communities—that is, protection and security—would not be attained. It is impossible that we should not disapprove of all such actions, and approve of the contrary.

2. There are some actions that are accounted virtuous, while their opposites are not punished, as in the case of those now mentioned. Doing good to persons that have no claim upon us—in other words, benevolence or philanthropy—is considered highly praiseworthy; but the neglecting of this is not usually visited with any punishment or censure; so that if it be a duty to perform acts of benevolence, it is a duty generically different from paying our debts, and respecting the person and property of our neighbor. The motives brought to bear on the two cases are widely contrasted: in the one, we *punish* for doing the action forbidden; in the other, we *reward* for doing the thing enjoined, and inflict no punishment if that is neglected. Here lies the difference between *duty*, strictly so called, and *merit*. In the bare performance of duty there is no merit; a man would not even be commended for the punctual payment of his just debts, if it were not that many people are deficient in this respect, and in the comparison with these the correct person excites in our minds a feeling of satisfaction. *Disapprobation* is the sentiment properly concerned with duty, or rather, with breach of duty; *approbation* is bestowed on all who do something over and above their duty. This distinction is known in every department of practical life; while speculative moralists habitually lose sight of it.

3. The virtues included under prudence are in a different position from either of the foregoing classes. Bearing the common names, virtue and duty, by which they are recognized as worthy of approbation or commendation, they are nevertheless unaccompanied with the sanctions either of punishment or of reward. The imprudent man is subject to no legal penalty, unless he clearly involves other persons in his imprudence; and the prudent man is not rewarded with the praise, esteem, or other benefits conferred upon the benevolent man. It is true that the young are punished by parents or teachers for imprudences; and some governments take such a paternal care of their subjects, as to punish them for sins against themselves. Men have been sent to prison, because of their endangering their own salvation by embracing heresy; but at the present day, such a proceeding is considered beyond the function of government. Men and women, arrived at maturity, are expected to take care of their own interests; even if they do not, no one punishes them; if they do, no one rewards them. We have, it is true, a certain feeling of disesteem in the one case, and of esteem or commendation in the other; neither of which, however, attains any considerable strength until more than the individual's self is involved. In short, although we cannot divest ourselves of all sentiment as lookers on, when men behave prudently or imprudently, our rule is *non-interference*; and this constitutes a marked distinction between the self-regarding and the social vices and virtues.

Accordingly, when ethical writers are endeavoring to probe the foundations of the moral sense in man, they ought to consider separately those three different species of conduct, for the sentiment excited by each is marked by strong peculiarities. To class social duties enforced by punishment, social virtues stimulated by rewards, and prudence, which is accompanied by neither, under one common designation, and discuss them as if they were essentially the same, is to confuse, instead of clearing up, the first principles of morality.

In Roman Catholic systems of theology, there are declared to be four *cardinal virtues*—"prudence, fortitude, temperance, and justice"—from which all other "moral" virtues are represented as flowing. But there is a prior division of virtues into the two classes of *theological* and *moral*; the theological virtues being faith, hope, and charity.

The distinction between these two classes is represented as consisting in this, that the theological virtues "*immediately* regard God;" and the moral virtues do not immediately regard God, but are commanded and rewarded by God, and are beneficial to ourselves.

CARDING or **COTTON**, etc., the process of disentangling and arranging in parallel rows the fibers of cotton. This operation may be compared to the combing and brushing of one's hair, and the *card* combines the properties of the comb and brush, being a brush with wire teeth instead of hairs. These teeth are inserted in strips of leather which are fixed upon the surface of a cylinder. Several such cylinders are arranged so that the ends of the teeth are nearly in contact; and the cotton being brought to them, is caught up, passed from one to the other, and combed out as the cylinders revolve in the form of beautiful films or fleeces, which are removed by a smaller drum-card, called the "doffer," and again from this by the "doffing-knife." These films, which are of the width of the drum, are next contracted to a narrow ribbon, by being passed through a funnel; and thus narrowed, are called the "card ends" or "slivers," and are now ready for the next process of "drawing" or "doubling." See **SPINNING**.

CARDINIA, a genus of fossil conchiferæ, containing 85 species, which extend from the Silurian to the inferior oolite. They have an oval or oblong shell, attenuated posteriorly, and marked with lines of growth, and an external ligament. They occur abundantly in the valuable layers of clay-ironstone called "mussel-bands." In Derbyshire, this material is wrought, like marble, into vases.

CARDITIS, or inflammation of the heart, a form of disease of very rare occurrence, if the term be limited in its application to cases of true acute inflammation of the muscular structure of the heart itself. C., however, was commonly understood in a wider sense, so as to include certain forms of disease of the external and internal lining membrane of the heart; and it is only since the beginning of the present century that, owing to the improvements in medical pathology and diagnosis, the names of pericarditis and endocarditis (q. v.) have come prominently into view as indicating the most ordinary inflammatory affections of the heart. See **HEART, DISEASES OF THE**.

CARDIUM and **CARDIA CEE**. See **COCKLE**.

CARDONA, a t. of Catalonia, Spain, about 44 m. n.w. of Barcelona. It is situated on a declivity on the right bank of the Cardener, is surrounded by walls, pierced with six gates, and commanded by a castle on a height. It is celebrated on account of a mountain of salt in its vicinity, which has a height of about 500 ft., and measures a league round. When the sun shines on this gigantic mass, the effect is of the most brilliant and gorgeous description. Pop. about 4000.

CARDOON, *Cynara cardunculus*, a perennial plant of the same genus with the artichoke (q. v.), a native of the s. of Europe and the n. of Africa. It very much resembles the artichoke, but is of larger size, whilst the flowers (heads of flowers) are smaller. It has long been in cultivation, for the sake of the blanched leaf-stalks and midribs of the leaves, which are used as a salad, or more generally as a boiled vegetable during winter.

CARDS. All that we know of C., for certain, is, that they are of ancient and eastern origin. What is asserted by count de Gebelin and the earliest writers upon the subject, that in their primary stage they constituted some sort of symbolic and even moral game, is not so well established. The Hindu and Chinese C. are, however, emblematic in a very high degree—the former illustrating the ten avatars, or incarnations of the deity Vishnu; and the so-called paper-tickets of the Chinese typifying the stars, the human virtues, and, indeed, almost anything you please. The learned sir William Jones expresses himself convinced that the Hindu game of *chaturaji*—the four rajahs or kings—a species of highly, complicated chess, was the first germ of that parti-colored paste-board which has been the ruin of so many modern fortunes. In the wardrobe accounts of Edward I., there is an item of money paid for the use of that monarch for playing at the four kings—"ad opus regis ad ludendum ad *quatuor reges*, viii. s. v. d."—which is supposed to have been a game at C.; but how and when painted C. took the place of carved figures, is still but matter of conjecture.

A pack of Hindustani C., in the possession of the royal Asiatic society, and presented to capt. Cromline Smith in 1815 by a high-caste Brahman, was declared by the donor to be actually 1000 years old. "Nor," quoth the Brahman "can any of us now play at them, for they are not like our modern cards at all." Neither, indeed, do they bear any remarkable resemblance to our own—the pack consisting of no less than eight suits of divers colors, the kings being mounted upon elephants, and the viziers, or second honors, upon horses, tigers, and bulls. Moreover, there are other marks by which the respective value of the common C. may be distinguished, which would puzzle our club quidnuncs not a little—such as "a pine-apple in a shallow cup," and "a something like a parasol without a handle, and with two broken ribs sticking through the top." In the Chinese dictionary, called *Ching-tsz-tung*, it is asserted that dotted C. were invented in the reign of Seun-ho (1120 A.D.), and devised for the amusement of his numerous wives; there are 30 C. in each of these packs, 3 suits of 9 C. each, and 3 single C. superior to all the others. The name of one of the suits is *Kew-ko-uan*—that is to say, the nine ten-thousands of *kwai*, strings of beads, shells, or money; and the titles of the other two suits are equally con-

ORNAMENTAL PLAYING CARDS (PERSIAN.)

cise and significant. The Chinese C. have, however, a decided advantage over those of Hindustan in being oblong instead of circular.

C. do not appear to have been known in Europe until towards the end of the 14th century. "In the year 1379," writes Carelluyzo, "was brought into Viterbo the game at cards, which comes from the country of the Saracens, and is with them called *naib*." "Whence afterwards," says Mr. W. Chatto (*Origin and History of Playing Cards*, Lond., 1848), "perhaps Jackanapes, Jack of cards." This entry occurs in the accounts of the treasurer of Charles VI. of France, in 1393: "Given to Jacquemin Gringonneur, painter, for three packs of cards, gilt and colored, and variously ornamented, for the amusement of the king, 56 sols of Paris." From the date of this year being immediately subsequent to that in which the king lost his reason, the story goes that C. were invented to divert his royal melancholy; but they were certainly of earlier use in France. The French clergy took greatly to C. about this time; we are afraid, too, it was to the ungenteel game of all-fours, since we find them specially forbidden that amusement by the synod of Langres, in 1404.

Card-making became a regular trade in Germany 14 years after this, and it, as well as card-painting, seems to have been carried on for some time exclusively by females; the wood-engraving of C., however, did not begin until some time afterwards. The pips were then very prettily imagined, the suits consisting of hearts, bells, acorns, and leaves. The place of her majesty the queen was filled by a knight in those days; and it is to Italy, and not to Germany or France, that the glory of giving *place aux dames* must be conceded. There was also no ace whatever! By 1420, gambling by means of C. had grown to such a pitch as to provoke St. Bernardin to preach against it at Bologna; and that so eloquently as to cause his hearers to make a fire in the public place and throw all the C. in their possession into it—a proceeding which must have been hailed with joy by the Messrs. De la Rue of that period. The signs upon Italian C., which seem to have been the first imported into England, were cups, swords, money, and clubs; but in the third year of Edward IV., their further importation was forbidden, and the home-trade of card-making protected. C. were played by that time, we read, "in all places of worship" in this country, by which it was meant, not in the churches, but in the houses of all the gentry. Henry VII. was a card-player; and there are not a few entries in that mean monarch's privy-purse account of his majesty's little losings. His daughter Margaret, at the age of 14, was found by James IV. of Scotland—the first time he ever saw her—in the act of playing cards; and it was most probably *écarté*, for he at once "proposed" to her, and she "accepted" him. There was a sum regularly allotted to the princess, afterwards queen, Mary, as pocket-money for this especial purpose; the sums given her at a time for immediate disbursement ranging from 20s. to 40s., but one entry being so disgracefully low (for a princess) as "two and tuppence." James I. likewise played a good deal, but so sleepily that he required somebody to hold his C. for him.

About the year 1660, heraldic C. were first introduced into England, the king of clubs being represented by the arms of the pope; of spades, by those of the king of France; of diamonds, by those of the king of Spain; and of hearts, by those of the king of England. From these heraldic C., we suppose, Mr. Chatto derives the word coat-card, instead of court-card, which is certainly in more general use. In 1679, a pack was published containing the history of all the popish plots, "excellently engraved on copper-plates, with very large descriptions under each card. Aspersers of this pack," it is added by their disinterested publisher, "plainly show themselves to be popishly affected."

The French, from whom we derive our ordinary suits of diamond, heart, spade, and club—*carreau*, *cœur*, *pique*, and *trèfle*—were continually changing their court-cards, and representing on them all sorts of historical characters. In the earlier periods, their kings were David, Alexander, Cæsar, and Charlemagne, or Solomon, Augustus, Clovis, and Constantine; about all of whom, as well as their queens, Père Daniel has the most ingenious theories. Troops, says he, however brave and numerous, require to have prudent and experienced generals. The *trèfle* or clover-plant, which abounds in the meadows of France, denotes that a chief ought always to encamp his army in a place where he may obtain forage for his cavalry; *piques* and *carreaux* signify magazines of arms, which ought ever to be well stored—the *carreau* being a sort of heavy arrow shot from a cross-bow, and which was so called from its head being squared (*carré*); *cœurs*, hearts, signified courage of both commanders and soldiers; the *ace* was the Latin *as*, and represented money, the sinews of war; and so on.

At the time of the French revolution, the places of the card-kings were filled by four philosophers—Molière, Lafontaine, Voltaire, and Rousseau; and those of the queens by four virtues—prudence, justice, temperance, and fortitude.

Many attempts have been made to put down card-playing by the strong hand of the law; but the history of the four kings has, nevertheless, always retained its students. Not a few enthusiastic players have absolutely died in harness, with cards in their hands, such as the great Bath player Lookup, who expired at his favorite "double dummy," not even being permitted by inexorable death to play out the game. The four kings, like their flesh-and-blood originals, were likely to lose all sway over the new world; for Mr. Chatto informs us, that the court-cards, if they could be called so, of a republicain

pack manufactured in 1848 at New York, had neither kings nor queens; the president of hearts being Washington; of diamonds, John Adams; of clubs, Franklin; and of spades, Lafayette. One of the queens was Venus, modestly concealing her charms; and the others were respectively Fortune, Ceres, and Minerva; while the knaves were fitly represented by Indian chiefs.

The manufacture of playing-cards comprises many interesting processes. The cardboard employed for this purpose is formed of several thicknesses of paper pasted together; there are usually four such thicknesses; and the paper is so selected as to take paste, paint, and polish equally well. The sheets of paper are pasted with a brush, and are united by successive processes of cold-drying, hot-drying, and hydraulic pressure. Each sheet is large enough for 40 cards. The outer surfaces of the outer sheets are prepared with a kind of flinty coating, which gives sharpness to the outline of the various colored devices. Most packs of cards are now made with colored backs. The ground-tint is laid on with a brush, and consists of distemper color, or pigments mixed with warm melted size. The device impressed on this ground-tint is often very beautiful. Messrs. De la Rue, the leading firm in the manufacture, employ tasteful artists, and invest a large amount of capital, in the introduction of new patterns. On cards sold at moderate prices, the colors at the back are generally two—one for the ground, and one for the device; but some of the choicer specimens display several colors; and many of the designs are due to the pencil of Mr. Owen Jones. The printing of the design is done on the sheets of paper, before the pasting to form cardboard. The pips or spots on the faces of playing-cards are now *spades, clubs, hearts, and diamonds*; but at different times, and in different countries, there have been leaves, acorns, bells, cups, swords, fruit, heads, parasols, and other objects similarly represented. In English cards, the colors are red and black; Messrs. De la Rue once introduced red, black, green, and blue for the four suits; but the novelty was not encouraged by card-players. The same makers have also endeavored to supersede the clumsy devices of kings, queens, and knaves, by something more artistic; but this, too, failed commercially; for the old patterns, like the old willow-pattern dinner-plates, are still preferred—simply because the users have become accustomed to them. Until within the last few years, the printing of cards was generally done by *stenciling*, the color being applied through perforated devices in a stencil-plate. The color employed for this purpose is mixed up with a kind of paste. When there is a device at the back, the outline of the device is printed from an engraved wood-block, and the rest filled in by stenciling. The stenciling of the front and back can be done either before or after the pasting of the sheets into cardboard. One great improvement in the manufacture, has been the substitution of oil color for paste or size color; and another, the substitution of printing for stenciling. Messrs. De la Rue have expended large sums of money on these novelties; for many experiments had to be made, to determine how best to employ oil color so that the spots or pips may be equal-tinted, the outline clear and sharp, the pigment well adherent to the surface, and the drying such as to admit of polishing without stickiness. The plates for printing are engraved on copper or brass, or are produced by electrotype, or are built up with small pieces of metal or interlaced wire. The printing is done in the usual way of color-printing, with as many plates as there are colors (usually five), and one for the outlines; it is executed on the sheets of paper, before being pasted into cardboard. When the printing, drying, and pasting are all completed, a careful polishing is effected by means of brush-wheels, pasteboard wheels, heated plates, and heated rollers, in such a way that the polish on the back may differ from that on the face—since it is found that two equally polished surfaces do not slide quite so readily over each other. Every pack of cards made in England for home-use pays a duty of threepence, which duty is levied on the ace of spades.

A few years ago, it was estimated that about half a million packs of cards are made annually in England, by about seven or eight firms. Card-playing is not now so general in England as it was early in the century, and the number made has consequently lessened, although the quality has greatly improved. All the cards used in Russia, with a few exceptions, are made at an imperial manufactory in St. Petersburg, where the operations are conducted on a large scale, and where the number of packs made exceeds manifold the whole produce of England. The French cards are somewhat smaller and thinner than those of England. The number of packs annually manufactured in the United States exceeds 14,000,000. In Corea, card-playing is frowned upon by the government, and is a pastime restricted to the lower classes, who indulge in it secretly.

Taylor, *History of Playing Cards* (1865); Willshire, *Descriptive Catalogues of Cards in the British Museum* (1877); Singer, *History of Playing Cards*; La Croix, *Les Cartes à Jouer*; Van Rensselaer, *The Devil's Picture-Books, a History of Playing Cards* (N. Y., 1890.)

CARDUCCI, BARTOLOMEO, 1560-1608; an Italian artist; b. in Florence; studied under Zuccherò, whom he accompanied to Madrid, where he painted the ceiling of the Escorial library. He died in Spain, where most of his works are to be found, the most celebrated being a "Descent from the Cross," in a church in Madrid. His brother, Vincenzo, (1568-1638), was also a painter of celebrity, and the author of a dialogue on the excellencies of painting.

CARDUCCI, GIOSUÉ, b. Tuscany, 1836; philologist, became professor of Italian literature at the University of Bologna in 1861; was a founder of the poetical review *Il Poliziano* in 1858; published several notable poems, and edited collections of Italian classical poetry and of mediæval popular songs.

CARDUE'LIS. See **GOLDFINCH**.

CARDUUS. See **THISTLE**.

CARDWELL, a co. in central Ontario, Canada, drained by several rivers, and having railroads, quarries of fine building stone, and massive ridges of limestone. Pop. '91, 15,392.

CARDWELL, EDWARD, 1787-1861; an English clergyman and ecclesiastical historian, educated at Oxford. In 1826, he was chosen Camden professor of ancient history, and during his period of office he wrote a translation of the *Ethics* of Aristotle, with notes, and *The Coinage of the Ancient Greeks and Romans*. In 1831, he was made principal of St. Alban's hall, and held the place through life. Among his publications were a student's edition of the Greek Testament; Josephus's history with notes; *Documentary Annals of the Reformed Church of England from 1546 to 1716*; *History of Conferences, etc., connected with the Revision of the Book of Common Prayer*; *Synodalia, a Collection of Religious Canons, and Proceedings of Convocation from 1547 to 1717*; and *Reformatio Legum Ecclesiasticarum*.

CARDWELL, EDWARD, Viscount, b. 1813; nephew of the Rev. Edward; graduated at Balliol college, and admitted to the bar, but preferred political life and entered parliament in 1842, being several times thereafter re-chosen. In 1845, he was secretary of the treasury and president of the board of trade. He was subsequently chief secretary for Ireland, chancellor of the duchy of Lancaster, and secretary of state for the colonies. In Gladstone's cabinet, 1868, he became secretary for war and a member of the committee of the council on education. In the war office he proposed and effected a reorganization of the army. With earl Stanhope he was one of the literary executors of sir Robert Peel, and one of the editors of Peel's *Memoirs*. He d. 1886.

CARE or **CARLE SUNDAY**, the Sunday before Palm Sunday, said to be so called because it was the practice in many parts of the country to eat gray peas, called carlings, fried in butter, pepper, and salt, on this day. This practice apparently had its more immediate origin in the custom of the Roman Catholic Church of eating hallowed beans fried at this time—these beans being described in some religious books as symbolical of confession, and their steeping before use, of meditation. It appears, however, to have been adopted by this church from a heathen custom. See Brand's *Popular Antiquities*.

CAREEN'ING is the operation of heaving down a ship on one side, in order to expose the other side for cleaning by the process of *breaming* (q.v.). C. is seldom now performed upon English ships, partly because the use of copper-sheathing lessens the fouling of the bottom, and partly because caissons and hydraulic lifts afford means for raising ships out of the water. The *Great Eastern*, in 1860, was placed upon an open scaffolding or frame, called a *gridiron*, in Milford Haven, and floated so as to render cleansing possible without the dangerous and difficult process of careening.

In sea-phrases, a vessel is said to "careen" when she leans over very much through press of sail.

CARET (from the Latin *careo*, I am wanting), a character of this form, ^, denoting that something has been omitted, and is interlined.

CARETTE is the name given to a form of street-car that has recently been introduced experimentally in some of the Western cities. It is smaller than the ordinary horse-car, is lightly built, and requires no track. Two horses draw it, and it seats comfortably some twenty persons.

CAREW, GEORGE, 1557-1629; Earl of Totness and Baron of Clopton; educated at Oxford and joined the army, holding an important command in the Irish wars against the earl of Desmond. He filled several offices, among them that of one of the lord judges of Ireland, in which by a vigorous but prudent policy he speedily reduced the rebels to submission. His crowning exploit was the capture of Dunboy castle, an event that greatly disappointed the Spanish allies of the Irish, and ended the war. For these services he was raised to the peerage and made governor of Guernsey. His last office was that of privy councillor to James I. He wrote *Hibernia Pacata*, a history of the wars in Ireland.

CAREW, RICHARD, 1555-1620; an Oxford student who at the age of 14 was chosen to dispute extemporaneously with sir Philip Sidney in the presence of an audience of noblemen. He was sheriff of Cornwall, and the author of a *Survey* of that county, a work that enjoyed a high reputation. He also wrote, or translated from the Italian, *The Examination of Men's Wits*; *The True and Ready Way to Learn the Latin Tongue*; and made a translation of the first five cantos of Tasso's *Jerusalem Delivered*.

CAREW, THOMAS, a poet of the reign of Charles I., descended from an old family in Gloucestershire, was b. 1589. Having been educated at Oxford, he traveled abroad for some time, and on his return was received at court, and patronized by Charles I. C. deserves mention chiefly as the precursor and representative of what may be called the

courtier and conventional school of poetry, whose chief characteristic was scholarly ease and elegance, with a spice of indelicacy, and even indecency. C.'s poems, mostly lyrical, and treating of trifling subjects, are among the best of their kind, and exhibit much fancy and tenderness. He died 1639. Several editions of his poems, which first appeared in 1640, have been published.

CAREX, a genus of plants of the natural order *cyperaceæ*, of which the species are very numerous—more than 450—principally abounding in the temperate and colder parts of the world. More than 60 are natives of Britain. The English name **SEDGE** or **SEG** is sometimes employed as synonymous with C., but is popularly applied only to some of the species. This genus is distinguished by unisexual flowers, the male flowers with one glume, the female inclosed in a flask-shaped involucre. Some of the species are plants of the very humblest growth, others are 2 or 3 ft. in height; all are of unpretending, grassy, or rush-like appearance. Some grow in wet, and others in dry situations; some are of great value in the economy of nature, as forming the principal part of the vegetation of swamps, which they gradually convert into fertile ground. The running roots, or rather *rhizomes*, are some help to bind the sands of sea-shores.

CAREY, HENRY, English composer, b. in London in 1683; d. there, Oct. 4, 1743. He was a reputed son of George Saville, Marquis of Halifax. After studying music under Claus Westeinson Linnert, Roseingrave, and Geminiani, he taught for his living, and wrote a number of musical dramas and ballad operas. He was the author of the libretto of *The Dragon of Wantley*, music by Lampe, London, Oct. 26, 1737; and also published six cantatas (1732), and *The Musical Century in One Hundred English Ballads* (1739-40; 3d ed., 1743). His name will be remembered for his ballad, *Sally in Our Alley*. The author's account of it is as follows: "A shoemaker's' apprentice, making holiday with his sweetheart, treated her with a sight of Bedlam, the puppet-shows, the flying chairs, and all the elegancies of Moorfields, from whence, proceeding to the Farthing Rye House, he gave her a collation of buns, cheese-cakes, gammon of bacon, stuffed beef and bottled ale, through all of which scenes the author dodged them. Charmed with the simplicity of their courtship, he drew from what he had witnessed this little sketch of nature." His son, **GEORGE SAVILLE CAREY** (1743-1807), poet and dramatist, endeavored to establish his father's claim to the composition of *God Save the King*, which question is still undecided. Carey's granddaughter, Anne, was the mother of Edmund Kean, the tragedian.

CAREY, HENRY CHARLES, an American political economist, b. at Philadelphia in 1793. In 1836 he published an essay on the *Rate of Wages*, which was expanded into the *Principles of Political Economy* (1837-40). The value of this work may be estimated from the fact, that no less an authority than Frederic Bastiat copied its leading ideas. It was translated into Italian and Swedish, and favorably noticed in all the important politico-economic journals of Europe. In 1838, C. published *The Credit System of France, Great Britain, and the United States*; and in 1848, *The Past, the Present, and the Future*, a work marked by great vigor and originality. In 1853, appeared the *Letters on the International Copyright*; in 1858, *Principles of Social Science*; in 1867, *Review of the Decade 1857-67*; and, in 1873, *The Unity of Law*. C. was originally a free trader, but was ere long recognized as the head of a new school of political economy. According to this system, free-trade may be the ideal towards which we should tend, but a period of protection is an indispensable stage in the progress towards it. He d. 1879.

CAREY, MATHEW, b. Ireland, 1760, d. Philadelphia, 1839; an author and publisher. In consequence of publishing an address to the Irish Roman Catholics on their oppression by the penal code (about 1778) he was compelled to leave Ireland, but returned within a year and established, in 1783, the *Volunteer's Journal*. His attacks upon parliament and the ministry caused his imprisonment in Newgate until the dissolution of parliament. He arrived in Philadelphia by the aid of Lafayette, who sent him \$400, and immediately started *The Pennsylvania Herald*, one of the first papers in the country to furnish accurate reports of legislative debates. In Jan., 1786, he fought a duel with col. Oswald, another editor, and was seriously wounded. He was subsequently connected with the *Columbian Magazine* and the *American Museum*. In 1791, he began trade as a bookseller, and with his sons built up a prosperous business. During the epidemic of yellow fever in 1793 he was active in the work of relief, and afterwards wrote a history of the disease. In 1793, he, with others, founded the Hibernian society, and in 1796 he assisted bishop White in establishing the first Sunday-school society. Carey was a constant writer, and published a great number of essays on party politics, political economy, and social questions. Among his favorite ideas were internal improvements and a protective tariff. His son Henry C. (q. v.) was one of the foremost American writers on political economy.

CAREY, WILLIAM, D.D., a distinguished minister and missionary belonging to the Baptist body, was b. at Paulersbury, a village in Northamptonshire, Aug., 1761. He served his time as a shoemaker, but began to preach about his 20th year. A pamphlet which he published about this time, attracted the attention of his co-workers in the ministry to the subject of foreign missions, and ultimately a missionary society, chiefly through C.'s exertions, was formed. C. and a Mr. Thomas were chosen its first missionaries to India in 1793. From that time until his death in 1834, C. was indefatigable

(under many difficulties, especially in his early years) in his efforts to spread the knowledge of the Gospel among the heathen. Under his direction, the Serampore mission, of which he was the principal founder, had up to 1832 issued above 200,000 Bibles, or portions thereof, in about forty oriental languages or dialects, besides a great number of tracts and other religious works in various languages. A great proportion of the actual literary labor involved in these undertakings was performed by C. himself, whose Sanskrit and other grammars have been very highly spoken of by the late Mr. Wilson Boden, professor of Sanskrit at Oxford. C. was professor of oriental languages at Fort-William college, Calcutta, from 1800 to 1830.

CARGILL, DONALD, abt. 1619-81; a leader of the covenanters, appointed to a church in Glasgow, where he made himself so obnoxious to the government that he was forced to leave. He was wounded in the battle of Bothwell, and fled to Holland; but returned almost immediately and joined Richard Cameron in publishing the Sanguhar declaration, and boldly excommunicated the king and his officials. He was soon afterwards arrested and beheaded at Edinburgh.

CARGO is a general name for all the merchandise carried on board a trading-ship. Sometimes it is applied also to the invoice of the cargo. The term *deck-cargo*, is given to the commodities on deck, which are not usually included in the policy of insurance.

For the security of the customs' revenue, the master of every coasting-vessel is bound to keep a *cargo-book*, recording the name of the vessel, the name of the owner, the port of departure, the port of destination, the goods taken, the name of the shippers and consignees, the time of departure and other particulars. The custom-house officers may demand to see this book at any time. The C. of passenger ships is placed, in some degree, under the control of the emigration officers by an act passed in 1852.

CARHEIL, ETIENNE DE, a Jesuit missionary among the Indians of Canada about 1668. He was among the earliest to master the native languages. The time of his death is not known, but he was at missionary work as late as 1721.

CARIA, in ancient geography, the south-westernmost country of Asia Minor, bounded n. by Lydia, e. by Phrygia, s.e. by Lycia, and w. and s.w. by the Mediterranean. A large portion of what was C. is mountainous. The chief ranges were called the Cadmian and the Latmian. The most important river was the *Meander*, famous for its windings. C. was, at an early date, governed by petty princes or kings; it afterwards became a part of the Persian empire, the former princes continuing to rule as satraps; and it subsequently came into the hands of the early Macedonian kings of Egypt; and finally, with the rest of Asia, into those of the Romans. Among the chief towns were Cnidus, Halicarnassus, and Miletus.

CARIA CO, a seaport of Venezuela, at the mouth of a river, and at the head of a gulf of the same name. It is 40 m. to the e. of Cumana, in lat. 10° 30' n., and long. 63° 40' west. Pop. 7,000. The gulf, long and narrow, with good anchorage, and well-wooded shores, is open only on the w., and that to a portion of the Caribbean sea, which is itself breasted by a chain of islands.

CARIACOU, CARJACOU, or VIRGINIAN DEER, *Cervus Virginianus*, a species of deer found in all parts of North America, from Mexico to about n. lat. 43°, and from the Atlantic to the Pacific ocean. It is the species commonly called deer by the Anglo-Americans. It is smaller and more elegant than the common stag; of very variable color—light reddish brown in spring, slaty blue in autumn, and dull brown in winter; the belly, throat, chin, and inner parts of the limbs white. The horns of the adult male are of moderate size, bent strongly backward, and then suddenly forward, so as to bring their tips nearly above the nose; they have several snags. The fawn is profusely decked with white spots, arranged in lines, and sometimes running into stripes. The name C. is extended generically to several nearly allied species, found in Mexico, California, etc.

CARIA MA, *Microdactylus cristatus*, a bird of the order *grallæ*, allied to the cranes, but exhibiting also points of strong resemblance to gallinaceous birds, among which it has therefore been proposed to rank it, next to the guans. It is a native of Guiana, Brazil, and Paraguay, inhabiting open plains and the outskirts of forests, where it feeds chiefly on serpents, lizards, and insects. It is larger than the common heron; the plumage is brown, finely waved with darker brown, whitish on the lower parts. When pursued, the Q. seeks safety by running, and does not readily attempt to use its wings. Its voice resembles that of a young turkey. It is much esteemed for the table, and it is sometimes reared in a domesticated state. See *illus.*, OSTRICH, ETC., vol. XI.

CARIBBEAN SEA, the grandest inlet of the western hemisphere—corresponding, in several respects, to the Mediterranean in the eastern—is separated from the gulf of Mexico by Yucatan, and from the Atlantic ocean by the great arch of the Antilles, between Cuba and Trinidad inclusive, stretching in n. lat. from about 8° to about 22°, and in w. long. from about 61° to about 89°. The C. S. forms the turning-point in the vast cycle of waters known as the Gulf stream (q.v.), that wheels round, with the regularity of time itself, from southern Africa to northern Europe. Its pours its waters into the Gulf of Mexico on the w., which shoots forth, on the e., the Florida stream with the computed volume of 3,000 Mississippi. To supply this enormous efflux, the C. S. draws on the Atlantic, laying under contribution nearly all the trade-wind regions of that ocean,

so as literally to become the receptacle of the Amazon and the Orinoco. To the British isles, it is, in this connection, an object of peculiar interest. Rendering still warmer the warm floods which it concentrates, it imparts to the Florida stream that high temperature which tends, with the aid of the prevalent winds, to mitigate climate from Guernsey to Shetland. In common with the islands of its eastern boundary, the C. S. takes its name from their now extinct aborigines, the Caribs.

CARIBBEE BARK, or **PITON BARK**, is the bark of *exostemma Caribæum*, a small tree which grows in the West Indies and in Mexico, and belongs to the natural order *cinchonaceæ*. The genus *exostemma* is very nearly allied to *cinchona* (q.v.).

CARIBBEE ISLANDS. See **ANTILLES**.

CARIBOU. See **REINDEER**.

CARIBS, Indians of the West India islands, who were in the time of Columbus numerous and powerful; a warlike and aggressive people, who pertinaciously opposed the advances of the Europeans. It is supposed, though not proved, that they were addicted to cannibalism. They have almost entirely disappeared from the islands; and at present their chief settlement is in Honduras, where they form an industrious and prosperous portion of the people, though still retaining their language and many of their customs. In 1796, the English, weary of the continual disturbances occasioned by the Caribs, transported them in a body from Dominica and St. Vincent to the island of Ruatan. There are two great tribes, the red, and the black.

CARICA. See **PAPAW**.

CARICATURE (Ital. *caricatura* from *caricare*, to load), a term sometimes used to denote a kind of satirical literature, but more often to define a pictorial or sculptured representation of some person, object or incident in which, as a rule, the features or lines are exaggerated so as to produce a ludicrous effect without destroying the likeness to the original. This degenerate form of art, which is common to all nations and periods of history, is found on monuments, walls, gems, pottery, and Egyptian papyri; exhibits itself in the grotesque carvings on mediæval cathedrals, or in the minute objects carved from ivory by a Japanese artisan of to-day. The word caricature is a modern one, occurring as *caricatura* in Sir Thomas Browne's posthumous work, *Christian Morals* (1716), but not appearing in its present form till about 1788, when Francis Grose published *Rules for Drawing Caricatures*. It is in popular usage applied almost entirely to work done with brush or pencil.

The etchings of Hans Holbein, the younger, of the "Dance of Death" were powerful satires on the life of his period, and the "Passionale of Christ and Antichrist" of Lucas Cranach not only aided the cause of the Reformation, but gave an impetus to caricature which has been employed by an increasing number of painters and etchers down to the present time, serving as an important factor in correcting social or political abuses, and often accomplishing with a few pencil strokes what debates and editorials had failed to bring about, or exerting a most pernicious influence when not allied with morality. It was reserved for the nineteenth century, in England, at least, to free caricature from brutal coarseness without depriving it of effectiveness. In political caricature England furnishes the pre-eminent names of Rowlandson, Gillray, John Doyle ("H. B."), and Tenniel; in caricatures of social life, those of Hogarth, George Cruikshank, Leech, Richard Doyle, Du Maurier (b. Paris), and Sambourne. France has produced, among many, Monnier, Charlet, Daumier, Gavarni, Grandville, de Noé ("Cham"), and Grévin; Spain has her unrivalled Francisco Goya; the United States, Nast, Keppler (both of German birth), and Frost. The principal modern journals devoted to caricature are the German *Fliegende Blätter* and *Kladderadatsch*; the French *La Vie Parisienne*, *Le Petit Journal pour Rire*, and *Le Journal Amusant*; the English *Punch* and *Vanity Fair*, and the American *Puck* and *Life*. See works (in French) on caricature by Champfleury; Parton, *Caricature and other Comic Arts* (1877); Everitt, *English Caricaturists of the 19th Century* (1886); Grand Carteret, *Les Mœurs et la Caricature en France* (1888).

CARIES (*rottenness*) is a disease of bone analogous to the ulceration of soft tissues. It is characterized by a gradual loss of substance, from the particles of bone being absorbed, or being cast off and washed away in a purulent discharge. It begins as an unhealthy inflammation, followed by exudation of new materials, and softening of the part affected. On examination, the bone-cells are found filled with a reddish glairy fluid, and in scrofulous patients, deposits of tubercle. After C. has existed for some time, an abscess forms, and bursts; its aperture remains open, discharging a thin fluid, which contains particles of the bone. If a probe be passed through this opening, it will be felt to sink into some soft gritty substance; this is the carious bone, which, if removed, and well washed, will be found to resemble in whiteness and fragility loaf-sugar softening in hot water.

C. may attack any bone, but it usually selects the vertebræ, those of the wrist and foot, and the soft ends of long bones forming joints. To this terrible disease most deformities, not congenital, are owing. The carious vertebræ yield under the weight of the trunk, and the spine curves forwards, or to one side. In the joint-ends of bones, the part enlarges, the cartilages become affected, matter forms, and amputation of the limb, or excision of the joint, is frequently necessary to save the patient's life. Too often the disease recurs with night-sweats, hectic, and death.

The causes of C. are constitutional, though it may be accidentally determined to some

particular part of the body by any irritation, such as a blow, or exposure to atmospheric changes. Scrofulous persons, and those who have had syphilis or mercury in excess at any period of their lives, are more subject to it than others. If affecting a small bone, the latter may be entirely removed; and if the disease is strictly limited to the ends of bones forming a joint, these may be excised. Within the last 30 years, great advances have been made in this department of surgery, and C. of the joints is but seldom counted a sufficient reason for amputation; the knee, hip, shoulder, elbow, ankle, and wrist joints have all been repeatedly excised successfully in this country. In situations where the part cannot be reached by instruments, lotions of dilute acid may be injected, with the view of stimulating the carious surface to assume a healing action.

The treatment of C. consists in supporting the patient's strength by judicious change of air, and tonics, with the administration of medicines, such as cod-liver oil in scrofula, which appear to combat the constitutional predisposition to the disease. In those parts where the diseased bone can be reached, it should be gouged or scraped away, so as to leave a healthy surface of bone, which may granulate up, and heal.

CARIES OF THE TEETH depends, it is supposed, on an original faulty formation of their substance, when, after any depressing cause, especially in scrofulous and ill-nourished persons, they soften and crumble away, at last laying open the cavity which contains the nervous pulp of the tooth, and producing toothache. *Treatment.*—The carious surface should be removed, and, as a substitute for the lost substance, gold or some other substance should be stuffed into the cavity. If the pulp be exposed, the hole should be stuffed with some softer material, till the parts are somewhat hardened; for this, some authorities recommend a plug of cotton-wool dipped in a mixture of mastich, a dram, and rectified spirit or eau-de-Cologne, 1½ oz.; or of gutta-percha dissolved in chloroform.

CARIGNANO, a t. of Piedmont, in the province of Turin, about 11 m. s. of the city of that name. It is situated near the left bank of the Po, in the midst of a most beautiful country; has some fine churches, and manufactures of silk-twist. This town gives name to a branch of the house of Savoy. Pop. about 7000.

CARILLON. See BELL.

CARIMATA, a name applied to the passage between Borneo and Billiton; also to a cluster of islets in the same passage; and, lastly, to the principal member of the group, whose highest point, a peak of 2,000 ft., is in lat. 1° 36' s., and long. 108° 54' e.

CARINARIA, a remarkable and interesting genus of gasteropodous mollusks, of the order called *heteropoda* or *nucleobranchiata*, having a thin shell, in form somewhat like that of a limpet, which, however, only covers the visceral sac (heart, gills, etc.), leaving the greater part of the animal exposed. The shells of some of the species have been sometimes denominated *Venus's slipper* and *glass nautilus*. The body is gelatinous, and so transparent that much of its interior organization can be seen. Nearly opposite to the part of the back occupied by the shell is a sort of vertical fin, answering to the foot of the other gasteropods. The species of C. are all marine, are found only in the seas of the warmer latitudes, and generally swim with the back downward. Closely allied to C. is the genus *pterotrachea*, in which there is no shell at all. See illus., TERTIARY PERIOD, vol. XIV.

CARINI, a t. of Sicily, in the province of Palermo, and 12 m. w.n.w. of the city of that name. It has an old castle, and a pop. of about 10,000, chiefly engaged in fishing.

CARINO'LA, a t. of s. Italy, in the province of Caserta, 20 m. s.e. of Gaeta.

CARINTHIA (Ger. *Kärnten*), a crown-land of the Austrian empire, forming part of the old kingdom of Illyria, with an area of 3958 sq. m., and a pop. in 1890, of 361,008, which is little more than what it was in 1880. The principal river is the Drave, which passes through the country from w. to e., in a course of almost 150 miles. The general aspect of the country is mountainous, with long deep valleys, that of the Drave widening at Villach and Klagenfurt into a great plain. The valley of the Drave divides the *Noric* from the *Carinthian Alps*. Agriculture is carried on to a limited extent, owing to the mountainous character of the country, great part of which is occupied in pasture, or covered with brushwood. Many horses and cattle are reared and exported. Lead and iron ores are extensively mined. One of the principal branches of industry is the manufacture of hardware; the other manufactures include woollens, silk stuffs, and cottons. The capital is Klagenfurt.—The ancient inhabitants were the *Carni*, who derived their name from the Celtic word *carn* or *corn*, Lat. *cornu*, Eng. *horn*—an allusion to the craggy, horn-like pinnacles of their hills. Before the time of Augustus, it belonged to Noricum, afterwards to the Roman empire. By and by the Carni were swept away in the deluge of immigration from the e., and Slaves settled in the country. After some time the Slaves themselves were so heavily oppressed by the Avari, that they called to their assistance a Frank, named Samo, who founded the kingdom of Carantania, which included much more than the present C., but fell to pieces after his death. Finally, it came into the possession of Austria (q.v.). Only about two sevenths of the present population is Slavic (Slovenians), the remainder being Germans.

CARINUS, MARCUS AURELIUS, son of Carus, succeeded his father as emperor of Rome in 283 A.D. He was a cruel and profligate ruler, and the soldiers naturally

rebelled, proclaiming Diocletian. Carinus marched into Moesia to quell the revolt, and won a decisive victory, but at the moment of triumph he was killed by one of his soldiers whose wife the profligate emperor had led away.

CARIPE, a t. of Venezuela, South America, situated in a fertile valley of the same name, 50 m. s.e. of Cumana. The valley is noted for a cavern frequented by the remarkable bird called guacharo (q. v.). Pop. of town and valley, 5000.

CARISBROOKE, a village in the isle of Wight almost adjoining Newport, chiefly noted for its castle, which is supposed to have been built by the Saxons in the 6th century. It was enlarged in the 11th c. by the first lord of Wight; was captured by Stephen in 1136, and in the time of Richard II. successfully resisted attacks by the French. During Elizabeth's reign it was further enlarged until its outer walls inclosed 20 acres. It was in this castle that Charles I. took refuge in Nov., 1647, but he soon found his asylum a prison. After his execution his two youngest children were confined in the castle, and the princess Elizabeth died there. The remains of the castle are still extensive. Opposite the castle-hill are the remains of a Cistercian priory founded in the 11th c., and the parish church claims even a greater antiquity.

CARISSA, a genus of plants of the natural order *apocynaceæ*. *C. carandas* is a thorny shrub, much used for fences in India; and the fruit, called carandas—a berry about the size of a small plum—for tarts and preserves.

CARIS'SIMI, GIOVANNI GIACOMO, b. about 1604 near Rome; became chapel-master, or director of music, at the age of 20. By education he belonged to the old Roman school of music, but his compositions mark the turning-point from the traditions of the renaissance period to the incipient aspirations of modern music. His numerous compositions include masses, cantatas, motets, and oratorios.

CARLEE, or **KARLI**, a village in India, 40 m. e. of Bombay, remarkable only for a Buddhist temple hewn into a rocky precipice which rises 800 ft. above the plain, the temple being about two thirds of the way up. The temple is 130 by 40 ft., with a high arched roof. An arch rises over the entrance to the artificial cavern, and before each of the side entrances are screens of stone-work ornamented with naked male and female figures in *alto-relievo*. In front are three large lions, and around the portico are figures of elephants, each one surmounted by a driver and a howdah or saddle containing figures of two persons. The interior is finished with a double row of sculptured pillars forming a semicircle. This curious temple is well preserved.

CARLEN, EMILIE, a well-known Swedish novel-writer, was b. 8th Aug., 1807, at Strömstad, near the frontier of Norway. She was the youngest of 14 children of a merchant named Smith. During childhood her talent in imaginative fiction was remarked by her friends; but it was not till 1838 that her first novel, *Waldemar Klein*, was given to the world. She was then a widow, having been married, in 1827, to Dr. Flygare. In 1841, she was again married to J. G. Carlen, a lawyer, and known as a poet, in Stockholm. Her literary productiveness has been very remarkable, her fictions being chiefly founded on the characteristics of the lower orders in Sweden; and, although faulty in many respects, they are especially rich and striking in incident; and her characters, without exhibiting any very deep insight or subtle analytic power, are yet intelligent and consistent. Among her many works, which have been translated into English, are *The Rose of Thistleland*; *The Birthright*; *The Hermit*; *The Events of a Year*; *The Lover's Stratagem*; *Gustavus Lindurm*; *The Maiden's Tower*; *Woman's Life*, etc. Her works are largely circulated both in Europe and in America. She died in 1883.

CARLETON, a co. in New Brunswick, Can., on the Maine border, drained by the St. John and its tributaries; 3008 sq.m.; pop. '91, 22,529. The surface is rough, with forests and excellent timber. Chief town, Woodstock.

CARLETON, a co. in e. Ontario, Can., on the Ottawa river; 647 sq.m.; pop. '91, 21,746. The co. is traversed by the Ottawa and Prescott railroad, and the Rideau canal. Lumbering is the principal business of the people. Chief town, Ottawa.

CARLETON, Sir GUY, Lord Dorchester, 1724-1808; a British officer distinguished at Louisburg, Quebec, and Belle Isle, and wounded in the siege of Havana in 1762. He was a lieut. gen. in the British army, and the successor of sir Henry Clinton in chief command in the American colonies during the war of the revolution and till its close.

CARLETON, WILLIAM, one of the most popular writers of tales describing Irish life and manners, was b. 1794, at Prillisk, in the co. of Tyrone, Ireland. Bred and educated among the peasantry, he passed through the common sufferings and privations of Irish poverty, and, after receiving some scanty instruction in a hedge-school, he, in his 17th year, went to an academy which a relative had opened at Glasslough, where he remained two years. Afterwards, a vague ambition led him to Dublin, where he arrived with only some three shillings in his pocket, and where, in 1830, he published his *Traits and Stories of the Irish Peasantry*. Their freshness of style pleased the public, and won the favor of critics. A second series, issued in 1832, was also well received; and, in 1839, he published a powerful story, entitled *Fardorougha the Miser*, in several passages of which, however, his humor becomes extravagant. Subsequently, C. published a series of tales (3 vols., Dub. 1841), mostly of pathetic interest, but including a very genial

and humorous sketch of the *Misfortunes of Barney Bramagan*, which proved a great favorite. The story of *Valentine M'Clutchy* is half-political and half-religious in its tendency, defending the Irish Catholic priesthood, and advocating repeal of the union; it appeared in 1845. Other narratives—*Rody the Rover*, 1846; *The Black Prophet*, 1847; and *The Tithe Proctor*, 1849—contain many proofs of the author's genius. *Willy Reilly*, 3 vols., appeared in 1855, and *The Evil Eye* in 1860. C. is the true historian of the Irish people. Sharing in their qualities of mind and temperament, he has a true sympathy with all their joys and sorrows, and a graphic pen to describe them. He d. in 1869.

CARLETON, WILL, American poet, born Hudson, Mich., in 1845; graduated at Hillsdale College in 1869; favorably known as a lecturer in the United States and Great Britain; author of *Poems* (Chicago, 1871); *Farm Ballads* (N. Y., 1878); *Farm Legends* (N. Y., 1875); *Young Folks' Centennial Rhymes* (1876); *Farm Festivals* (1881); *City Ballads* (1885); *City Festivals* (1892); *Rhymes of our Planet* (1895), etc. His poems, *Betsy and I are out, Over the Hills to the Poorhouse*, and *The Burning of Chicago*, were very popular.

CARLETON PLACE, a town in Lanark co., Ontario, Canada; 28 miles from Ottawa; on the Canadian Pacific railroad. It contains large saw-mills and railway and other workshops. Pop. 1891, 4435.

CARLI, GIOVANNI RINALDO, a distinguished Italian economist and archæologist, was b. at Capo d'Istria, April, 1720. Educated at home and at Flambro in the Friuli, he was, in his 24th year, appointed professor of astronomy and navigation at Padua. In 1754, he published the first volume of his great work *On the History of the Coins and Currency and on the Institution of the Mints of Italy*. He died Feb., 1795.

CARLINE, or **CAROLINE**, is a small silver coin used in some of the Italian states. It was named after Carlo VI. of Naples, and its intrinsic worth is about seven cents.

CARLINE THISTLE, *Carlina*, a genus of plants of the natural order *compositæ*, closely allied to the true thistles, from which they are distinguished by the inner scales of the involucre spreading like rays, and being colored and shining. These involucre scales are remarkably hygrometric, expanding in dry and closing together in wet weather, and this property they retain for a long time; the heads of flowers are therefore often nailed on cottage-doors in many parts of Europe, to indicate the weather. The name C. T. is derived from a legend, that an angel showed the root of one of the species to Charlemagne, as a remedy for a plague. This species, *C. acaulis*, grows on hills and mountains, especially in calcareous soils in the middle latitudes of Europe. It has a very short stem, and very large heads of flowers, and was formerly in high repute for the medicinal virtues of its root—which is in large doses a drastic purgative—but its use is now almost confined to veterinary practice.—The only British species is the common C. T. (*C. vulgaris*), not unfrequent in England and some parts of Scotland, and sometimes rather a troublesome weed, but always indicative of a poor soil. It has a stem about a foot high; and purplish heads of flowers set amidst straw-colored rays.

CARLINGS, in shipbuilding, are small beams laid fore and aft, and resting upon the main or deck beams. These, with other pieces called *ledges*, laid at right angles to them, form a framework by which the deck is supported.

CARLINVILLE, a city and co. seat of Macoupin co., Ill., on the Chicago and Alton railroad, 39 m. s.w. of Springfield. It is the seat of Blackburn university, is an important centre for local trade and has several coal mines. Pop. '90, 3293.

CARLISLE, a co. in western Kentucky, on the Mississippi river, formed 1886 from part of Ballard; about 190 sq. m.; pop. '90, 7612. It is drained by Mayfield Creek, and crossed by the Mobile and Ohio and Illinois Central railroads. Surface, nearly level; productions, corn, tobacco, and pork. Co. seat, Bardwell.

CARLISLE, a borough and co. seat of Cumberland co., Penn., on the Cumberland Valley and the Gettysburg and Harrisburg railroads; 18 m. w. of Harrisburg. It is in a highly productive agricultural region; is well built, with wide and handsome streets, and several fine public buildings. Dickinson College was founded here in 1783 by the Presbyterian denomination. It is also the seat of the U. S. Indian Training School, and of Metzger Female College. Carlisle Springs, in the mountains, is a popular summer resort. Washington had his head-quarters in C. during the Whiskey Rebellion in 1794, and in July, 1863, the place was bombarded by the confederates. Pop. '90, 7620.

CARLISLE, a parliamentary and municipal borough, episcopal city, and ancient town in North Cumberland, the capital of the co., 12 m. e. of the Solway firth, 300 m. n.w. by n. of London, 101 m. s. of Edinburgh, and 60 w.s.w. of Newcastle. It is a chief station on the w. railway route from London to Edinburgh, and is the terminus of seven different lines of railway. It stands on an eminence in a wide plain at the confluence of, and nearly surrounded by, the Eden, Caldew, and Peteril. Many fine new streets and buildings have been lately added to the city. The chief branches of industry are cotton, gingham, and check manufactures; print, iron, and dye works; and salmon fisheries. It has a small cathedral of red freestone, of which Paley was archdeacon. The castle was founded in 1092, and is now a barracks; the remains of the keep form a massive lofty tower, with a very deep well. Mary queen of Scots was confined in the castle after the battle of Langside. A canal of 11 m., from Bowness on the Solway

first to C., formerly admitted vessels of 100 tons; but the bed of the canal has now been converted into a railway, from which a line also branches to the newly formed port of Silloth, where an extensive dock has been constructed on the Solway, at a distance of 20 m. from Carlisle. Pop. in 1763, 4,000; 1801, 10,221; 1851, 26,310; 1861, 29,417; 1891, 39,200. C. returns one member to parliament. Roman remains have been found here—coins, altars, inscriptions, brass incense vases, etc. Being near the w. end of Hadrian's wall, C. was probably a Roman station. It was the seat of the ancient kings of Cumbria. The Picts and Scots ravaged it. About 900, it was destroyed by the Danes, after which it remained desolate for 200 years. Thence to the union of England and Scotland, it was closely connected with the border wars, and underwent many sieges. To its being long a fortified border town it owed much of its importance and privileges, but it declined much after the union. During the civil war it declared for King Charles and suffered severely at the hands of the Parliamentarians. The C. corporation in 1745 proclaimed prince Charles king of Great Britain. The duke of Cumberland afterwards took the city, and punished the chief actors with death, and the inhabitants with other cruelties. In 1133, Henry I. made C. a bishopric.—The C. tables of mortality, based on the deaths which occurred in C. 1779–87, were drawn up by Dr. Heysham, and have been ever since much used by life-insurance offices.

CARLISLE CATHEDRAL was commenced about 1092 by Walter, a Norman. It was founded by William Rufus, and dedicated in 1101 by Henry I.; and in 1133, was made the cathedral church of the newly formed diocese. A great part of the original Norman building was destroyed by fire in 1292. The new edifice contains specimens of all the styles of early English—simple pointed, geometric, and flowing. Two thirds of the fine Norman nave, originally 141 ft. long, were destroyed by Cromwell; the portion that was left has long been used as a parish church. In 1853, the restoration was commenced. The choir is one of the finest in England, 138 ft. long, and 72 high, and consists of 8 pointed arches. The e. window, consisting of 9 lights, is considered the finest decorated window in England. The tower is very low, rising but one story above the choir. It formerly supported a timber spire, which was removed in 1661. This cathedral has four canons.

CARLISLE, GEORGE WILLIAM FREDERICK HOWARD, Earl of, K.G., was b. April 19, 1802. Educated at Eton and Oxford, he, in 1821, obtained the Chancellor and Newdegate prizes for his Latin and English poems. He entered the public service in 1826 as an attaché. In 1830, he (then lord Morpeth), along with Henry (afterwards lord) Brougham, was elected one of the representatives of the important constituency of Yorkshire, and after the reform bill for the West Riding, a position which he held in the liberal interest for several years. Under the administration of lord Melbourne, he held the office of chief secretary for Ireland (1835–41), and his impartial distribution of patronage made him very popular in Dublin. Rejected in 1841 by the West Riding, he was again elected in 1846, and remained one of its representatives until the death of his father (1848) called him to the house of lords. Under lord John Russell's ministry (1846–52), he was chief commissioner of woods and forests, and afterwards chancellor of the duchy of Lancaster. When lord Palmerston was made prime minister in 1855, C. was appointed lord lieutenant of Ireland, a post which he held until the advent of the earl of Derby's government in 1858; and he succeeded to the same office again when lord Palmerston was reinstated in 1859. C. obtained some reputation as a literary man, chiefly by his lectures on his travels in the United States, on the life and writings of Pope, and his *Diary in Turkish and Greek Waters*. He died in 1864.

CARLISLE, JAMES H., LL.D.; b. S. C., 1825; graduated at S. C. college, 1844; taught a classical school in Columbia until 1854; prof. mathematics in Wofford college, Spartansburg, 1854–75, when he was elected president. He has pub. addresses, edited *Ascham and Arnold*, in the "Chautauqua Garnet series," and is a counselor of the Chautauqua Literary and Scientific circle.

CARLISLE, JOHN GRIFFIN, b. Ky., 1835; received a common school education, and taught school. He was admitted to the bar, 1858; was elected to the lower house of the legislature, 1866, and to the state senate, 1866 and 1869; was lieut.-gov. of Ky., 1871–75; was presidential elector, 1876. He was elected to congress in 1877, and became prominent by his advocacy of revenue reform, and by his services on the committee of ways and means. C. was elected speaker of the house in 1883. He is regarded as one of the leading advocates of free trade, although he has declared that he favors only an approximation to the free trade standard. He was elected U. S. senator in 1890, resigned in 1893 to become secretary of the treasury, and resumed law practice in 1897.

CARLISTS. See CARLOS DE BOURBON and CARLOS, DON.

CARLOS DON, Infante of Spain, b. July 8, 1545, at Valladolid, was a son of Philip II. After his recognition as heir to the throne, in 1560, Don C. was sent to study at the university of Alcalá de Henares; where, however, he profited so little, that the king, regarding him as unqualified to reign, invited a nephew, the archduke Rudolf, to Spain, intending to make him heir to the throne. Excluded from all participation in the government, Don C. conceived a strong aversion toward the king's confidants, and especially was unwilling that the duke of Alva should have the government of Flanders.

In confession to a priest, on Christmas eve, 1567, he betrayed his purpose to assassinate a certain person; and as the king was believed to be the intended victim, this confession was divulged. The papers of Don C. were seized, and being tried, he was found guilty of conspiring against the life of the king, and of traitorously endeavoring to raise an insurrection in Flanders. The sentence was left for the king to pronounce. Philip declared that he could make no exception in favor of such an unworthy son; but sentence of death was not formally recorded. Shortly afterwards, he died, July 24, 1568, and was interred in the Dominican monastery, El-Real, at Madrid. The suspicion that he was poisoned or strangled, has no valid evidence to support it. Schiller, in his tragedy *Don Carlos*, has widely departed from historical testimonies.

CARLOS, LUIS MARIA FERNANDO, Don, 1818-61; son of Don Carlos Maria Isidor. In 1846, he lived in England with his father, under the name of Montemolin. In April, 1849, he went in disguise to Spain, was discovered and kept in prison for a few days, but returned to England before the end of the month. In 1860, he invaded Spain with 3,000 men, and was defeated and made prisoner at Tortosa. Being again set free, on condition of renouncing his claim to the throne, his first act was to repudiate that renunciation.

CARLOS, MARIA DE LOS DOLORES JUAN ISIDOR JOSEF FRANCESCO QUIRINO ANTONIO MIGUEL GABRIEL RAFAEL, Don, b. Mar. 30, 1848; nephew of Luis Maria Fernando; present claimant of the throne of Spain as the legitimate heir of Charles VIII. As Charles VI. died without issue, his rights devolved upon his brother Don Juan, who had married the archduchess Maria Theresa of Austria, princess of Modena. Their son, the present Don Carlos, was educated principally in Austria, and married Margaret de Bourbon, princess of Parma, daughter of the late duke Ferdinand, Charles III., and sister of the present count de Chambord, who claims to be Henry V. of France. In Oct., 1868, Don Juan abdicated in favor of his son, whose standard was raised by some of his partisans in the n. of Spain in April, 1872. On the 16th of July following, Don Carlos published a proclamation calling upon the people of Catalonia, Aragon, and Valencia to take arms in his cause, promising to restore their ancient liberties; and in Dec. his brother, Don Alfonso, assumed command of the Carlist forces in Catalonia. Don Carlos himself made his entry to Spain, July 15, 1873, announcing that he came for the purpose of saving the country. Thenceforward there was incessant war in the n. part of the kingdom or the republic, in which there were victories on both sides; but for the most part the battles were unfavorable to the Carlists, until Feb., 1876, when their cause was completely crushed at Tolosa, the defenders of that last stronghold flying in a panic toward France. Don Carlos went to Paris, where, Mar. 3, 1876, he proclaimed: "Being desirous of putting a stop to bloodshed, I forbear continuing a glorious but at present fruitless struggle. In the face of a great superiority of numbers, and in view especially of the sufferings of my volunteers, it becomes necessary to return the sword to the scabbard. I will never sign a convention [abandonment of all claims]." He was expelled from France, in 1881, for ostentatiously supporting the cause of the Duc de Chambord. Don Carlos has five children, four daughters and a son.

CARLOS, SAN, a t. of Venezuela, South America, in a valley on the Aguaré, a feeder of the Orinoco, 120 m. s.w. of Caracas. Before the wars of independence it was a place of considerable importance, having been one of the richest towns in the province. The town is handsome and well laid out. Pop. with district, about 10,400.

CARLOS DE BOURBON, Don MARIA ISIDOR, b. Mar. 29, 1788, was the second son of Charles IV. of Spain, and was educated chiefly by priests. After the expulsion of the French from Spain, his brother, Ferdinand VII., reascended the throne; but having married thrice without issue, Don C. began to cherish the hope of succeeding his brother. An insurrection in his interest broke out in 1825, in Catalonia; but was put down, Don C. himself not participating in it. A fourth time, however, the indefatigable Ferdinand married, and the result was a daughter, the infanta Maria Isabella (late queen of Spain), b. Oct. 10, 1830. Now, as the Salic law, excluding females from succession to the throne, had been abrogated, the hopes of the Carlists, as the followers of Don C. were called, were destroyed. During the illness of the king, in Sept. 1832, the Carlists succeeded so far as to win from him a re-institution of the Salic law; but he revoked it again as soon as he had partially recovered, and thus Don C. was again disappointed. As he still continued his agitation, he was banished, in 1833, to Portugal, and soon afterwards was commanded to reside in the papal states. But before C. had embarked for Italy, king Ferdinand VII. died, Sept. 29, 1833. Don C. was now recognized as heir to the throne of Spain, not only by the Carlists but also by Dom Miguel in Portugal; and having refused to obey the queen-regent's order for his deportation to Italy, he was declared a rebel, Oct. 16, 1833. By the quadruple alliance of Spain, Portugal, England, and France, both C. and Dom Miguel were banished from Portugal, and in June, 1834, the former embarked for England. In the following month, he returned to the continent, passed in disguise through France into Spain, where he excited an insurrection in the northern provinces, but was ultimately compelled to escape into France. In 1836, his claims to the throne were unanimously rejected by the constituent cortes. In 1844, he abdicated in favor of his eldest son; and died at Trieste, Mar. 10, 1855.—DON CARLOS, his son, b. 1818, was better known as the count de Montemolin. This second pretender made an attempt, in 1849, to pass

under a disguise through France into Spain, but failed. In 1860, a Carlist insurrection was once more attempted, in consequence of which the count de Montemolin and his brother were arrested, but liberated after the former had signed a renunciation of all his claims to the Spanish throne. He d. in 1861. The present representative of his pretensions is his nephew, Don Carlos, son of his brother Juan, b. 1848. On his behalf, Carlist risings—speedily repressed—took place in 1869, 1870, and 1872; but the insurrection headed by Don Carlos, after the abdication of king Amadeo, in 1873, proved much more formidable, and kept the northern provinces of Spain in great confusion till the beginning of 1876, when it was crushed. See CARLOS, MARIA DE LOS, etc.

CARLOTTA, Ex-Empress of Mexico (MARIE CHARLOTTE AMÉLIE AUGUSTE VICTOIRE CLÉMENTINE LÉOPOLDINE), the daughter of Leopold I., king of the Belgians, was born in 1840, and married, at the age of seventeen, Maximilian, archduke of Austria, afterward emperor of Mexico. She accompanied him to Mexico in 1864, where by the suggestion and advice of Napoleon III. he had been invited by the Mexican people. The empress remained with him until, owing to the embarrassments which beset him, he found it imperative to send her to France, in order to seek aid from Napoleon, from whom he expected every assistance. Her mission was fruitless. She applied then to the Pope, for, previous to his departure for his new empire on the western hemisphere, Maximilian had visited the Pope and received his blessing. To His Holiness the empress went, but was again doomed to disappointment. Her failure to change the current of events by her mission to Europe, and the disastrous consequences attending the closing days of the empire, broke her heart, and her reason gave way under the terrible pressure of her afflictions. She was taken to the chateau of Laeken, not far from Brussels, and, while her recovery is considered hopeless, she is constantly engaged in her apparently lucid intervals in writing *Memoirs of the History of the Mexican Empire*. See MAXIMILIAN.

CARLOVINGIANS, the second dynasty of Frankish kings. The origin of the family is traced to Arnulph, bishop of Metz, who d. in 631. His son, Anségise, married a daughter of Pepin (q.v.), of Landen, in Austrasia. His sons, Martin and Pepin d'Heristal, as the greatest territorial lords in Austrasia, were called to the office of mayor of the palace. Martin was assassinated; Pepin, by force of arms, compelled the weak Merovingian king, Theudoric III., to invest him with the office of mayor of the palace in all the three Frankish states, Neustria, Austrasia, and Burgundy. Pepin allowed the Merovingian kings to remain upon the throne, but they were kings only in name. He d. on 17th Dec., 714, and left as his successor, his young grandson, Theodoald; but Charles Martel (q.v.), a natural son of Pepin, was made mayor of the palace by the Austrasians, and in this capacity subjected the three states to his power. He d. in 741. His two sons, Carloman, and Pepin le Bref, divided the kingdom, although for a time the nominal Merovingian dynasty still subsisted; but Pepin at last formally assumed the royal power, and was crowned king of the Franks on 3d May, 752. This is the formal commencement of the Carolingian dynasty. Pepin began the conquest of Italy. His sons, Carloman and Charles the Great or Charlemagne (q.v.), succeeded him, of whom the latter soon reigned alone, and prodigiously extended his dominions. In 800, pope Leo III. set upon his head the crown of the western Roman empire. He divided his dominions amongst his sons, of whom, however, only one, Louis le Débonnaire, survived him, who, in the list of the kings of France, appears as Louis I., but who was properly emperor and king of the Franks. With Charlemagne, however, the high abilities of his family suddenly disappeared, and his successors showed much weakness of character. Family feuds broke out during the life of Louis le Débonnaire, who had divided his dominions in part amongst his sons, and he terminated an inglorious reign in 840. By a treaty concluded in Aug. 843, Lotharius I., the eldest son of Louis, obtained the imperial crown and the kingdom of Italy, with Lorraine, Franche Comté, Provence, and the Lyonnais; Louis, his brother, called Louis the German, obtained the German part of his father's dominions; and Charles the Bald, the son of a second marriage, obtained Neustria, Aquitania, and the *Spanish Mark*, and may almost be regarded as the founder of the French monarchy. The emperor Lotharius I. died in 855, and his dominions were again divided—his eldest son, Louis II., being emperor and king of Italy, and his two other sons kings of Lorraine and of Provence, but their kingdoms reverted to the emperor.—Charles the Fat, a son of Louis the German, having become emperor, was elected by the French nobles to be their king in 882; and being previously in possession of Italy and Germany, united under his sway great part of Charlemagne's empire. But he was a weak monarch, and was deposed in 887. The imperial dignity passed by the marriage of the daughter of the emperor Arnulph with Fritslar, count of Franconia, to another family. The French dynasty, of which Charles the Bald may be deemed the founder, continued in a succession of weak monarchs for about a century, till it terminated with the reign of Louis V., on whose death, Hugh Capet, the most powerful nobleman in France, seized the crown in 987. The Carolingian kings had for some time previous possessed no real power. A subsequent marriage, however, connected their family with that of the Capets, and enabled the kings of France to trace their descent from Charlemagne.

CARLOVITZ, or KARLOVICZ, a t. of Hungary; in Croatia-Slavonia. It is situated on the right bank of the Danube, about 8 m. s.s.e. of Peterwardein, and is noted for its

excellent wine, and for the treaty concluded here in 1699. The wine—especially the red variety—ranks with the best and strongest obtained in Hungary, and in some years the product has amounted to about $1\frac{1}{2}$ million of gallons. Pop. abt. 5,500. The important treaty or peace of C. was concluded, in 1699, between the allies Austria, Russia, Poland, and Venice on one side, and the Porte on the other, and included the following articles: "That Austria should repossess the territories captured by the Turks during two centuries (which included Hungary and Slavonia, and she also acquired Transylvania); that Venice should hold the Morea as far as the isthmus; that Poland should take back Podolia and the lands in the Ukraine conquered by Mohammed IV., but should cede certain places in Moldavia; and that Russia should have the territory of Azof."

CARLOW, the capital t. of Carlow co., Ireland, situated at the confluence of the Burrun and the Barrow, 56 m. s.w. of Dublin by rail. It is a well-built town, with two principal streets, from which branch many smaller ones, and a suburb, Graigue, in Queen's co., on the opposite side of the river, with which it is connected by a bridge. It has a Roman Catholic cathedral and divinity college. C. has extensive flour-mills, and is the emporium for the agricultural produce of the district, largely exported from this place. Pop. '91, 6,600. It returns one member to parliament. There are here the remains of a castle, picturesquely situated on an eminence on the Barrow, founded in 1180 by sir Hugh de Lacy. In 1361, the duke of Clarence established the exchequer of the kingdom in this place. It constituted one of the boundaries of the PALE, beyond which the king's writ was not recognized by the "Irishry." Its first charter was granted in the 13th c. by William Marshall, earl of Pembroke. The town grew up around this castle, which was several times besieged by, and alternately in the possession of, the English and Irish. The castle (one of great extent) was in the possession of the insurgents in 1650, when it was closely invested by Gen. Ireton and the republican army. The garrison surrendered on conditions to sir Hardress Waller, whom Ireton had left to conduct the siege. It was then dismantled; and about one half of this once stately castle now remains a picturesque ruin. In the Irish insurrection of 1798, the insurgents attacked the town, but were repulsed by the garrison and yeomanry, and 600 of them killed. The Barrow is here navigable for small-craft to its junction with the Grand canal at Athy.

CARLOW, a small inland co. of Ireland, in Leinster province, with an area of about 349 sq. m., of which $\frac{2}{3}$ ths are arable. C., except in the southern extremity, where it is hilly, is a triangular fertile level, or gently undulating plain, between the Wicklow and Wexford range of hills on the e., and the highlands beyond the Barrow on the west. The chief rivers are the Barrow and Slaney. C. consists chiefly of granite, covered in the middle plain, or richer tracts, by limestone gravel, on which are fine loams and pasture. In the uplands, the soil is gravelly. Lower, carboniferous limestone crops out in the valley of the Barrow. On the w. side of the co. begins the great coal district of Leinster. In 1876, 79,345 acres were under crop, the chief crops being oats, potatoes, barley, and wheat. There are many dairies on the plains. The chief exports are corn, flour, meal, butter, etc. Along the Barrow, which falls above a foot per mile, are a great many extensive corn-mills. Pop. '41, 86,228; '51, 68,059; '91, 40,936. It returns two members to parliament—one for the co. at large, and one for the borough of Carlow. The chief towns are Carlow, Tullow, and Bagenalstown. At Old Leighlin a synod was held, in 630, to settle the time of Easter. Several engagements occurred in the co. during the Irish rebellion of 1798. The chief antiquities of C. are cromlechs, castles, and the cathedral church of Old Leighlin. A cromlech near Carlow town has a covering stone 23 ft. long, and of nearly 90 tons.

CARLOWITZ. See CARLOVITZ.

CARLSBAD, or KAISER-KARLSBAD, a t. in Bohemia, much celebrated for its hot mineral springs, and frequented in summer by visitors of the most aristocratic character from all parts of Europe. The permanent population does not amount to more than about 12,000, who are very industrious, making carpets, knives, scissors, needles, wood-work, and articles of Bohemian glass, such as are likely to induce visitors to purchase. The visitors in a season, which usually lasts from 15th June to 15th Aug., amount to more than 30,000. The wells have been frequented from a very early period, but have been of great celebrity since the 14th century. The scenery is extremely beautiful. The town is well built, the accommodation for guests good, and the place free from some of the abuses too common at other German spas. No gaming-houses exist here. The temperature of the hot springs varies from 117° to 167° Fahrenheit. The principal spring, the Sprudel, has a very large volume, and is forced up to a height of 3 ft. from the ground. Great quantities of the water and salt are exported. The principal ingredients in the water are sulphate of soda, carbonate of soda, and common salt. The whole town of C. appears to stand on a vast caldron of boiling water, which is kept from bursting only by the safety-valves the springs provide. On one occasion, after an explosion, poles of 30 fathoms in length, thrust into the aperture, did not reach the bottom. A congress of German powers, held here in Aug., 1819, issued the so-called Carlsbad decrees (q. v.). See Kraus, *Carlsbad* (Lond., 1888).

CARLSBAD DECREES. The resolutions passed at congress at Carlsbad in 1819 by the representatives of the German states under the leadership of Austria. They opposed the granting of state constitution, reviving a strict censorship of the press, and placed the universities under police supervision. Another feature was the appointment of a central commission of inquiry for the purpose of seeking out secret societies, and directed especially against the so-called Burschenschaft which was regarded as a revolutionary organization. Their effort was to crush out the liberal spirit in the German states.

CARLSBURG, or **KARLSBURG**, a t. of Transylvania, situated on the right bank of the Maros, here crossed by a bridge some 200 yards in length, 48 m. s. of Klausenburg. It is built partly on a hill, and partly in a valley, is fortified, and has a citadel surrounded by walls with bastions. Gold and silver, obtained from the mines of Transylvania, are purified and coined here. The only manufacture of importance is saltpeter. Maros Porto, the chief shipping-place for Transylvanian rock-salt, is within half a mile of the town. C. occupies the site of the ancient *Apulum*, remains of which are still found. Pop. '90, 8,200.

CARLSKRONA, capital of the province of the same name in Sweden, is situated on the rocky island of Trotsö, and its adjoining islets in the Baltic, which are connected by bridges, in lat. 56° 9' n., long. 15° 35' east. The town was built in 1680 by Charles XI., who gave it his own name, and conferred upon it several important privileges, besides making it the great naval station and arsenal of Sweden, instead of Stockholm. It has a magnificent harbor, with a sufficient depth of water to float the largest vessels. The only practicable entrance for large ships is defended by two strong forts. The dry-docks, blasted out of the granite rock at vast expense, are an attraction to strangers. The inhabitants are chiefly employed in connection with the arsenal. Pop. 95, 22,496.

The province of C. or Blekinge is situated in the s. of Sweden, in lat. 56° to 56° 30' n., long. 14° 30' to 16° east. It has the Baltic on its s. and e. margins. It has an area of about 1164 sq. m. with a pop. of 143,387 in 1895. It is hilly without being mountainous, and generally fertile, yielding rye and potatoes abundantly, and also wheat, oats, and peas. The fisheries employ a large number of the inhabitants.

CARLSHAMN, a fortified t. on the s. coast of Sweden, about 30 m. w. of Carlskrona, at the end of a beautiful valley. The harbor is small but secure, and a considerable trade in iron, timber, pitch and tar is carried on. There are manufactures of sail-cloth, tobacco, hats, soap, and leather; there are also dye-works and shipbuilding yards. Pop. abt. 7200.

CARLSRUHE, the capital of the grand duchy of Baden, is situated a few miles eastward from the Rhine. It was founded by the Markgraf Charles-William of Baden-Durlach, in 1715, and built on a curious and regular plan in connection with the palace, which constitutes the center point from which the streets, so far as constructed, diverge in the shape of an extended fan. The streets are wide and well paved. There are a number of fine buildings; flourishing educational institutions; the court library contains 80,000 volumes; a public library, 90,000; and there are valuable collections of antiquities, objects of natural history, etc. An aqueduct from the Durlach supplies the town with water. In the market-place, which is the finest of the public squares, a stone pyramid incloses the remains of the founder of the city. The manufactures include machines of various sorts, carriages and wagons, jewelry, carpets, chemical products, furniture, tools, pottery, and cloth. C. is generally spelled *Karlsruhe*. Pop. 1896, 83,997.

CARLSTAD, a t. of Sweden, on the island of Tingvalla, in lake Wenern, about 160 m. w. of Stockholm. It is connected with the mainland by two bridges, one of which is a large and very handsome structure. The town is well built, has a cathedral, cabinet of natural history, etc., and commands extensive views of the most beautiful scenery. Its trade is large, consisting in exports of iron, copper, timber, and corn. Pop. 8000.

CARLSTADT, a t. of Croatia-Slavonia, in Austria-Hungary, situated in a rich plain between the rivers Kulpa and Korona, 25 m. s.w. of Agram. It is fortified—the original fortress having been erected in the 16th c. to resist the Turks—has an old castle, and armory of 30,000 stand of arms. It has a large garrison, the Austrian executive looking upon it as a place of considerable importance, on account of its position on a navigable river, and on the great road into the center of Croatia from the coast. It has few manufactures, but an active transit trade. Pop. 5,600.

CARLSTADT, **KARLSTADT**, or **KARLOSTADT** (real name **ANDREAS RUDOLF BODENSTEIN**), 1480-1541; a German reformer, at first a friend and afterwards an opponent of Luther. He became a professor in Wittenberg, first in philosophy and then in theology, and in 1511 was rector of the university, about which time he became a personal friend of Luther. Carlstadt went to Rome to study canon law, returning to Wittenberg in 1515, where he took up the defense of Reuchlin, the scholar against whom a violent persecution was raging. In 1517, he published arguments asserting the supreme authority of the Scriptures, and declaring that in the silence of Scripture, appeals from the fathers of the church must be made to reason. When Luther nailed his thesis to the door of the church, Carlstadt supported him. In the bill against Luther, Carlstadt was especially named and condemned; and he was the first to appeal from the pope to a general council. In 1521, by invitation of the king, he went to Denmark to

teach the doctrines of the reformation; but he soon returned. About this time, differences sprang up between Carlsstadt and Luther, owing to the former's hot-headedness; he demanded violent measures, where Luther desired prudence and patience. While Luther was imprisoned, Carlsstadt greatly impaired the cause by his extreme course, and at last Luther declared against him. Being compelled to leave Wittenberg, Carlsstadt became a pastor in Thuringia, where his violence created a suspicion that he was associated with Anabaptists, and that he might be implicated in the schemes of the peasant revolt. The elector sent Luther to find out the true state of affairs; and when Luther preached against Carlsstadt at Jena, they held a discussion on the "real presence," which Carlsstadt was the first to deny, and an open quarrel broke out between them. Carlsstadt was ordered out of Saxony, and wandered from place to place exciting tumults, and prompting the people to destroy pictures and images in the churches. Again suspected of provoking insurrection, he was pursued and exposed to hardships, and even danger to his life. In this extremity he appealed to Luther, through whose influence he was permitted to return to Saxony, where for some years he led a quiet life. This quiet was unendurable by his restless spirit, and he once more attacked Luther; the controversy, in which Zwingli agreed with Carlsstadt in his views of the Lord's supper, grew fiercer than ever, and Carlsstadt, who was no longer permitted to dwell in Saxony, fled to Friesland, and thence to Switzerland, where Zwingli's influence made him a pastor, and afterwards an archdeacon at Zurich. In 1534, he settled as professor of theology in Basel, remaining there until his death. He was the first priest to write against celibacy, and the first Protestant clergyman to take a wife.

CARLTON, a co. in n.e. Minnesota, on the Wisconsin border, intersected by the Northern Pacific and Lake Superior railroads; 860 sq.m.; pop. '90, 5272. Surface uneven, and for the most part covered with maple and pine trees. Co. seat, Carlton.

CARLTON, THOMAS, D.D., 1808-74; b. N. H.; a Methodist minister, who in 1829 began his work in the Western New York conference in Rochester, Buffalo, and other places. He was for 20 years the principal agent of the Methodist book concern in New York city.

CARLUDOVICA PALMA'TA, a South American shrub or tree bearing the leaves from which Panama hats are woven, the best of which are plaited from a single leaf, the work requiring many weeks of labor.

CARLUKE, a municipal burgh in the middle of Lanarkshire, near the right bank of the Clyde, 6 m. n.w. of Lanark. Pop. '81, 3,867. The neighborhood is rich in coal, iron, and limestone, and mining is the chief industry of the place. The orchards around cover 130 acres. Not far off is Lee, the seat of the Lockharts, where is preserved the famous Lee penny, noticed by sir W. Scott in the *Talisman*.

CARLYLE, JANE WELSH. See **CARLYLE**, THOMAS.

CARLYLE, JOSEPH DACRE, 1759-1804; educated at Cambridge, and a fellow of Queens' college. He succeeded Dr. Paley as chancellor of Carlisle, and in 1794 was appointed professor of Arabic at Cambridge. He had already published a translation of an Arabic history of Egypt, and in 1796 he issued a volume of *Specimens of Arabic Poetry*. Lord Elgin procured Carlyle's appointment in the Turkish embassy, which gave him an opportunity to travel in the east, where he collected Greek and Syriac manuscripts for a contemplated revision of the New Testament, but he did not live to do the work.

CARLYLE, THOMAS, was b. 4th Dec., 1795, in the t. of Ecclefechan, parish of Hoddam, Dumfriesshire, Scotland. Educated first at the parish school, and afterwards at Annan, he passed to Edinburgh university, with a view to entering the Scottish church, in his 15th or 16th year. Here he studied irregularly, but with amazing avidity. The stories which are related of his immense reading are almost fabulous. About the middle of his theological curriculum, C. felt wholly disinclined to become a clergyman, and, after a short period spent in teaching at Dysart, in Fifeshire, he embraced literature as a profession. His first efforts were contributions to Brewster's *Encyclopædia*. In 1824, he published a translation of Legendre's *Geometry*, to which he prefixed an essay on proportion, mathematics having, during his college years, been a favorite study with him. In 1823-1824, had appeared in the *London Magazine* his *Life of Schiller*, and, during the same year, his translation of Goethe's *Wilhelm Meister*. In 1825, the *Life of Schiller* was recast, and published in a separate form. It was very highly praised; indeed, one can discern in the criticisms of the book certain indications of the genius of Carlyle. The translation of *Wilhelm Meister* met with a somewhat different fate. De Quincey, in one of his acrid and capricious moods, fell foul both of Goethe and his translator; while lord Jeffrey, in the *Edinburgh Review*, admitting C. to be "a person of talents," slashed in cavalier fashion at the book. In 1827, C. married Miss Welsh, a lineal descendant of John Knox, and, during the same year, appeared his *Specimens of German Romance* (4 vols., Tait, Edinburgh). From 1827 to 1834, he resided chiefly at Craigenputtock, a small property in Dumfriesshire, belonging to his wife—the "loneliest nook in Britain," as he says himself in a letter to Goethe, "fifteen

m. n.w. of Dumfries, among the granite hills and the black morasses which stretch westward through Galloway almost to the Irish sea." Here C. revolved in his mind the great questions in philosophy, literature, social life, and politics, to the elucidation of which—after his own singular fashion—he has earnestly dedicated his whole life. Here, also, he commenced to write the splendid series of critical and biographical essays which first familiarized Englishmen with the riches of modern German thought. For this work, he was incomparably better fitted than any man then living in Great Britain. Possessing a knowledge of the German tongue such as no foreigner ever surpassed, he was also inspired by the conviction, that the literature of Germany, in depth, truthfulness, sincerity, and earnestness of purpose, was greatly superior to what was admired and relished at home. Gifted, moreover, in a degree altogether unexampled, with a talent for portraiture, he soon painted in ineffaceable colors on the British memory, the images of Schiller, Fichte, Jean Paul Richter, and other foreign magnates, until then almost unheard of. Gradually, educated circles awoke to the fact, that a literary Columbus had appeared among them, who had discovered a "new world" of letters, the freshness and grandeur of which were sure to attract, sooner or later, multitudes of adventurous spirits. One of his most beautiful, eloquent, and solid essays written at Craigenputtoch, was that on *Burns* (*Edinburgh Review*, 1828). It has given the tone to all subsequent criticism on the Scottish poet. The article on *German Literature*, in the same periodical, is a masterly review of a subject, the importance of which C. at length succeeded in compelling his countrymen to acknowledge. But his *chef-d'œuvre* written on the moorland farm, was *Sartor Resartus* ("the tailor done over," the title of an old Scottish song). This work, like all his after-productions, an indescribable mixture of the sublime and the grotesque, was offered to various London firms, and rejected on the advice of their sapient "tasters," and at length published in successive portions in *Fraser's Magazine* (1833-34). It professes to be a history or biography of a certain Herr Teufelsdröckh ("Devil's Dirt"), professor in the university of Weissnichtwo ("Kennaquhair"), and contains the manifold opinions, speculations, inward agonies, and trials of that strange personage—or rather of C. himself. The whole book quivers with tragic pathos, solemn aspiration, or riotous humor. Carlyle removed to London, at about this time. In 1837, appeared the first work which bore the author's name, *The French Revolution, a History*. Nothing can be more gorgeous than the style of this "prose epic." A fiery enthusiasm pervades it, now softened with tenderness, and again darkened with grim mockery, making it throughout the most wonderful image of that wild epoch. C. looks on the explosion of national wrath as a work of the divine Nemesis, who "in the fullness of times" destroys, with sacred fury, the accumulated falsehoods of centuries. To him, therefore, the revolution is a "truth clad in hell-fire." During the same year, he delivered in London a series of lectures on *German Literature*; in 1838, another series on *The History of Literature, or the Successive Periods of European Culture*; in 1839, another on *The Revolutions of Modern Europe*; and a fourth in 1840, on *Heroes, Hero-Worship, and the Heroic in History*; of these only the last has been published. Meanwhile, the first edition of his *Miscellanies* (contributions to the reviews) had appeared in 1838, and his *Chartism* in 1839. In 1843, followed *Past and Present*, which, like its predecessor, showed the deep, anxious, sorrowful interest C. was taking in the actual condition of his countrymen. In 1845, he published what is by many considered his masterpiece—*Oliver Cromwell's Letters and Speeches, with Elucidations and a Connecting Narrative*. The research displayed in this book is something marvelous, but the author has been nobly rewarded for his toil, inasmuch as his vindication of the protector's character is most triumphant. To C. has thus fallen the unspeakable honor of replacing in the pantheon of English history the statue of England's greatest ruler. In 1850, the *Latter-Day Pamphlets*, the fiercest, most sardonic, most furious of all his writings, came out. The violence of the language in these pamphlets offended many. Next year (1851) appeared the *Life of John Sterling*—a biography of intense fascination for the younger intellects of the age. In 1858-1860, C. published *The History of Frederick the Great*; and in 1865 he was elected lord rector of Edinburgh university.

The sudden death of Mrs. Carlyle, in 1866, overwhelmed her husband with grief, and to grief was added remorse, when he discovered from some of her letters and from her journal that his ill-temper and selfishness had caused her much misery and ill-health. It is a fact also that during 1855-56 they were for a time estranged, owing to C.'s liking for the society of Harriet, Lady Ashburton. In 1867 C. visited Mentone, where he composed part of his personal *Reminiscences*; then, returning to London, contributed to *Macmillan's Magazine* an article entitled "Shooting Niagara," and giving his views of British democracy. In 1875 he added to a special edition of his works a new volume containing "The Early Kings of Norway," and an "Essay on the Portraits of John Knox." In 1874 he received the Prussian royal order "for merit" in recognition of his having written the life of Frederick the Great, and in the same year was offered by Mr. Disraeli the Grand Cross of the Bath (with the alternative of a baronetcy) and a liberal pension, but he declined them both. In 1881, Feb. 4, he died at his house in Chelsea. A burial in Westminster Abbey was offered, but his wish to be buried among his kindred at Ecclefechan was respected. His wife is buried beside her father at Haddington. C. appointed James Anthony Froude his literary executor, who, in conformity with

the terms of the trust, published *Carlyle's Reminiscences* (1881); *Thomas Carlyle: the First Forty Years of his Life* (1882); *Letters of Jane Welsh Carlyle*, exhibiting her as an accomplished woman and brilliant letter-writer (1883), and *Thomas Carlyle: Life in London* (1884). A revulsion of feeling followed; the literary world being shocked by the bitterness and spite abounding in these records; Mr. Froude was attacked with great violence for disclosing these defects, and a subscription that had been started for a monument was abandoned; but time revived the old-time admiration for Carlyle's genius, his noble aims, and his perfect sincerity. See *The Correspondence of Thomas Carlyle with Ralph Waldo Emerson* (Boston, 1883); *Early Letters of Thomas Carlyle* (N. Y., 1886; second series, 1888); *Correspondence between Goethe and Carlyle* (N. Y., 1887); all edited by Prof. C. E. Norton. See also Wylie, *Thomas Carlyle, the Man and his Books* (1881); Masson, *Carlyle, Personally and in his Writings* (1885); Larkin, *The Open Secret of Carlyle's Life* (1886); Garnett, *Life of Thomas Carlyle* (1887).

CARMAGNOLE, the name of a popular song and dance, which was notorious as the accompaniment of many excesses in the French revolution. It first became popular in the s. of France, where it was named after Carmagnole, in Piedmont, the home of many Savoyard boys who played the tune. The song began with:

Madame Vêto avait promis,

and every verse ended with the refrain:

Dançons la Carmagnole—vive le son—du canon!

Fashion soon adopted the word, which was next applied to a sort of jacket, worn as a symbol of patriotism. Afterwards it was applied to the bombastic and fanatical reports of the successes and glory of the French arms. With the reign of terror, the song and the jacket, associated with so many dismal recollections, together disappeared.

CARMEL is a mountain-ridge, 6 or 8 m. long, stretching nearly n. and s. from the plain of Esdraelon into the sea, the only great promontory on the low coast of Palestine. It is composed of a whitish stone, in which flints, sometimes curiously shaped, are imbedded. The height has been variously stated, but is probably about 1500 ft. above the level of the plain. On the e. is the river Kishon, and the plain of Esdraelon; on the w., a small plain descending to the sea. Oaks, pines, olives, laurels, and other trees grow abundantly on the mountain; and various wild-fruits evince its ancient fertility and cultivation. The name C. means *the garden of God*, or "a very fruitful region." Mt. C. is renowned in Jewish history, and is often alluded to in the imagery of the prophets. On the summit of Mt. C., there is a monastery called Elias, after the prophet Elijah, the monks of which take the name of "Carmelites." It is built on the supposed site of the grotto where Elijah lived, and the spot where he slew the priests of Baal.

CARMEL, KNIGHTS OF THE ORDER OF OUR LADY OF MOUNT, were instituted by Henry IV. of France, and incorporated with the order of the knights of St. Lazarus of Jerusalem. The order of Mt. C. consisted of 100 gentlemen, all French, who were to attend the king in his wars, and had considerable revenues assigned to them. The order was confirmed by bull by pope Paul V., in 1607.

CARMELITES, or ORDER OF OUR LADY OF MOUNT CARMEL, a monastic order probably founded as an association of hermits on Mt. Carmel by Berthold, count of Limoges, about 1156. A legend, however, ascribes the foundation of the order to the prophet Elijah; and another makes the Virgin Mary to have been a Carmelite nun. Driven out by the Saracens in the 13th c., the C. wandered over Europe; and Simon Stoch, their general, changed them into a mendicant order in 1247. From that time, they shared in the usual vices of the mendicant orders. They subsequently divided into several branches, more or less rigid in their rules, one distinguished by walking barefooted. They exist at the present day in many Roman Catholic countries.—The order of *Carmeliteses*, or *Carmelite nuns*, was instituted in 1452, and is very numerous in Italy.

CARMEN SYLVA. See ELIZABETH, QUEEN OF ROUMANIA.

CARMINATIVES (from Lat. *carmen*, a charm), medicines to relieve flatulence and pain in the bowels, such as cardamoms, peppermint, ginger, and other stimulating aromatics.

CARMINE, or **CARMIN** (Arabic, *kermes*), is a beautiful red pigment obtained from cochineal, and which is employed in the manufacture of the finer red inks, in the dyeing of silk, in coloring artificial flowers, and in miniature and water-color painting. It was first prepared by a Franciscan monk at Pisa, who discovered it accidentally, while compounding some medicine containing cochineal; and in 1656, it began to be manufactured. It is the finest red color known, and was more largely used formerly than now for imparting a healthy aspect to the cheek of beauty. One process for its preparation is to digest 1 lb. of cochineal in 3 gallons of water, for 15 minutes; then add 1 oz. of cream of tartar; heat gently for 10 minutes; add half an oz. of alum; boil for 2 or 3 minutes; and after allowing any impurities to settle, the clear liquid is placed in clean glass pans, when the C. is slowly deposited. After a time, the liquid is drained off, and the C. dried in the shade. In the preparation of C., much depends on a clear atmosphere, and a bright sunny day, as the pretty color of the C. is never nearly so good when it has been prepared in dull weather, and this accounts in great part for the superiority of

French C. over that prepared elsewhere. The great expense of pure C. has led to the fabrication and vending of substitutes. The *rouge* of the theaters is made from red sandal-wood, Brazil wood, benzoin, and alum, which are boiled in brandy or vinegar till a paint of an intense red color remains. A more harmless material is obtained by evaporating the mixture till the liquid is driven off, and making up the red residue with balm of Mecca, spermaceti, or butter of cacao. The depth of the red tint may be lessened by the addition of chalk. The little color-saucers called *rouge dishes*, obtained from Portugal, contain pure C.; but imitations are made in London. *Spanish wool* and *oriental wool*, which are impregnated with red paint, intended for use on the cheek for improving the complexion, are seldom genuine.

CARMÖE, or KARMÖE, an island of Norway, at the entrance of the Bukke fiord, in the North sea, and 20 m. n.w. of Stavanger, in lat. 59° 20' n., long. 5° 15' east. A strait 2 m. in width separates it from the mainland. With a length of 21 m., and an average breadth of 5, it has a small population, who are principally engaged in the fisheries, and in cattle-rearing.

CARMO'NA, a. t. of Andalusia, Spain, 20 m. n.e. of Seville. It is situated on an elevated ridge, overlooking a rich and olive-clad plain, and its old massive Moorish walls and castle give it a very picturesque appearance. It has a fine old Gothic church, and the gate of Cordova is a most interesting piece of architecture. It has manufactures of woolen cloth, hats, leather; also flour and oil mills, and an important annual cattle-fair. Pop. 17,500.

CARNAC, a village in the department of Morbihan, France, 17 m. s.e. of Lorient. It is remarkable on account of the great Celtic monument situated about three quarters of a mile from the village, on a wide desolate plain near the sea-shore. The monument consists of 10,000 to 12,000 rude broken obelisks of granite, resting with their smaller ends in the ground, rising, many of them, to a height of 18 ft., though a large proportion does not exceed 3 ft., and arranged in 11 parallel rows, forming 10 avenues extending from e. to w., and having at one end a curved row of 18 stones, the extremities of which touch the outer horizontal rows. The origin and object of the monument remain a mystery. Similar but smaller structures are found to the w. of C., at Erdevan and St. Barbe. Pop. 3000.

CARNAHUBA PALM, or CARANAIBA PALM, *Copernicia cerifera*, a very beautiful species of palm, which abounds in the northern parts of Brazil, in some places forming vast forests. It attains a height of only 20 to 40 ft.; but its timber is valuable, is used in Brazil for a great variety of purposes, and is imported into Britain for veneering. The fruit is black, and about the size of an olive; it is sweet, and is eaten both raw and prepared in various ways. Scales of wax cover the under side of the leaves, and drop off when the fallen and withered leaves are shaken. Being collected in this way, the wax is melted into masses; and beeswax is often adulterated with it. It has been imported, and used in the manufacture of candles, but no method has yet been devised to free it of its yellowish color. See illus., **PALMS, ETC.**, vol. XI.

CARNARIA (Lat. *caro*, *carnis*, flesh), the Latinized form of the French *carnassiers*, the name given by Cuvier to a great order of *mammalia*, which, according to his system, includes all the not marsupial *feræ* of Linnæus, and along with them the bats, from the Linnæan order *primates*. The C. have the toes terminated by claws; none of them have an opposable thumb on any of the extremities; they have incisors or cutting teeth, canine teeth or tusks, and molar teeth or grinders, but their dentition varies according to their kind of food, some preying on insects, others on the higher animals, whilst many of them are by no means exclusively addicted to animal food, but subsist in great part, and a few bats entirely, on vegetable substances. Cuvier at first included the marsupial quadrupeds in this order; but afterwards, recognizing more fully the great importance of the characteristic from which they derive their name, constituted them into a distinct order, the remaining C. being divided into *chiroptera* (bats, q.v.), *insectivora* (q.v.), and *carnivora* (q.v.).

CARNARVON, HENRY HOWARD MOLYNEUX HERBERT, fourth earl of, b. in Grosvenor square, 1831. His family is a branch of the house of Herbert, earls of Pembroke, springing from maj.gen. the Hon. W. Herbert, whose son, Henry, was created, in 1780, baron Porchester of Highclere, Hampshire, and advanced to the earldom of Carnarvon in 1793. The present earl was educated at Christ Church, Oxford, where he was first-class in classics in 1852. His father dying before he was of age to sit in the house of commons, he lost the advantage of the training in public speaking and statesmanship which the sons of peers usually enjoy during the lifetime of their parents, in the lower house. He took his seat on the conservative benches, and soon showed himself ambitious of parliamentary distinction. His earlier speeches in the house of lords were not thought to exhibit much vigor and grasp of intellect, and were marred by a simpering and affected delivery. He was appointed governor of Carnarvon castle in 1854. In 1858, he became under-secretary of state for the colonies, in the administration of the earl of Derby. In 1859, he received the degree of D.C.L., and was elected high steward of the university of Oxford. He resigned office with the conservative ministry in 1859, and availed himself of the period of leisure thus obtained to visit the east. The fouds of the

tribes in the Lebanon had broken out in a massacre of the Christians; and the earl of C. gave the world the benefit of his investigations, in an interesting work, entitled the *Druses (q. v.) of the Lebanon*. On his return, he delivered lectures in the country, and speeches in the house of lords, on prison discipline, education, and other social subjects. When the conservatives again returned to power in 1866, C. accepted from lord Derby the office of secretary of state for the colonies, with a seat in the cabinet. In this he obtained for his colonial administration a large share of public confidence. He censured in calm and measured language the misconduct of the courts-martial during the Jamaica insurrection, and especially the trial and execution of Mr. Gordon; and the pacification of the colony satisfactorily progressed under his instructions. During the recess, he developed and framed a plan for the confederation of the British North American colonies; and when parliament met in 1867, he explained the provisions of the measure in an elaborate speech. The bill met with general approval in both houses, and it passed; but before it obtained the royal assent, C. had, with two other colleagues in the cabinet, resigned office upon the reform bill of the Derby government, which he regarded as democratic in its operation, and dangerous in its results. When the reform bill came before the house of lords, C., in an animated speech, vindicated his consistency at the expense of his colleagues; and in the discussions in committee, he addressed the house with great vigor and argumentative ability. He edited in 1869 a work by his father, who was an accomplished scholar. It is entitled *Reminiscences of Athens and the Morea; Extracts from a Journal of Travels in Greece during 1839, by the late Earl of Carnarvon*. He has also published one or two of his lectures. On Mr. Disraeli's return to power in 1874, lord C. resumed office as secretary of state for the colonies; but resigned in Jan. 1878. He was lord-lieutenant of Ireland in 1885-6. He published translations of the *Agamemnon* (1879) and the *Odyssey* (1886). Died in 1890.

CARNARVON. See CAERNARVON.

CARNATIC, a country of somewhat indefinite dimensions on the e. or Coromandel coast of the peninsula of Hindustan. While some carry it as far inland as the Western Ghauts, others limit its breadth to about 75 miles. The length is generally taken from cape Comorin to about 16° north. The C. is no longer a recognized division of the country, and exists only in history as the grand theater of the struggle of last century between France and England for supremacy in India.

CARNATION, one of the finest of florists' flowers, a double-flowering variety of the clove pink (*dianthus caryophyllus*, see **PINK**), and existing only in a state of cultivation. It has long been a universal favorite, both on account of its beauty and fragrance, although it does not appear to have been known to the ancients. The stem is about 3 ft. high, and generally receives support. There are varieties, called *tree carnations*, with much taller stems. See **PINK**.

CARNATION (from Lat. *caro*, flesh). Flesh-tints in painting are called carnations. The art of producing the true color of flesh, from the rarity with which it is acquired by artists, would seem to be one of the most difficult branches of coloring. Whether from their painting less from the nude than the old masters, or from some other cause, it is certain that the moderns, and particularly the English, have been very unsuccessful in this respect. It is said that the pigments must be laid on thick and pasty. The ochres are preferable to vermilion for the local colors; and ultramarine ashes, or Veronese green, mixed with asphaltum, may be used for the shadows.

CARNEADES, a Greek philosopher, b. at Cyrene, in Africa, about 213 B.C. He studied logic at Athens under Diogenes, but became a partisan of the academy, and an enemy of the stoics, whose stern and almost dogmatic ethics did not suit his skeptical predilections. Conspicuous for his eloquence and skill in "tongue-fence," he was destitute of any convictions moral or intellectual, and had even arrived at the conclusion that no criterion of truth existed in man. In 155 B.C., along with Diogenes and Critolaus, he was sent as ambassador to Rome, where he delivered two orations on justice, in the first of which he eulogized the virtue, and in the second proved that it did not exist. Honest Cato, who had no relish for intellectual jugglery, and thought it a knavish excellence at the best, moved the senate to send the philosopher home to his school, lest the Roman youth should be demoralized. C. died at Athens, 129 B.C. He was remarkable for his industry, negligent habits, and impatient temper.

CARNEGIE, ANDREW, manufacturer and philanthropist, was born in Dunfermline, Scotland, in 1835. His family emigrated to the U. S. in 1845, and settled in Allegheny, Penn. He was set to winding bobbins in a cotton factory; became later a messenger in the Atlantic and Ohio Telegraph Co., working himself up to superintendent. He made a fortune in oil; became interested in iron works at Pittsburg, Penn., and soon was known as the largest manufacturer of iron, steel rails, and coke in the world. Among his public gifts are those of a free library and baths to his native town, the Carnegie Laboratory for the New York Bellevue medical coll., and free libraries to Pittsburg, Allegheny City, Braddock, and Ayr, and Edinburgh. Becoming interested in English politics, he bought up several radical English newspapers, and was asked to stand for parliament, but declined to enter public life. In 1890 he was presented with the freedom of the city of Dundee. Besides contributing articles to leading periodicals, he

has published *Round the World; An American Four-in-Hand in Great Britain* (1883), describing a coaching trip with a party of English and American friends; and *Triumphant Democracy* (1886), an enthusiastic account of the social and material progress of the United States (revised edition, 1893).

CARNE'IA, a festival in honor of Apollo among the ancient Spartans, taking its name from the Greek name of the month (August) in which it was celebrated. The celebration lasted nine days.

CARNE'LIAN, or CORNELIAN, in mineralogy, the name given to some of the finer varieties of chalcedony (q. v.). The color is blood-red or flesh-color, reddish brown, reddish white or yellow, more rarely milk-white. The fracture is in the common C. perfectly conchoidal, but there is a variety of a somewhat fibrous structure with a splintery fracture. C. is found in pieces of irregular form and in lamellar concretions. The finest specimens are brought from the east, but it is found in Scotland and in many parts of Europe and America. It is much used by the lapidary, and in the east it is prized beyond every other stone, the gems excepted. Bright red C. of unmixed color is most highly valued, but a mass of considerable size is seldom found with the color equal throughout.

CARNIFEX FERRY, in Nicholas co., Va., near which, Sept. 10, 1861, there was an engagement between the union forces under Gen. Rosecrans, and the confederates under Gen. Floyd, the latter being defeated with the loss of camp equipage and war material. Floyd escaped by retreating over Gauley river and destroying the bridge.

CARNIO'LA (Ger. *Krain*), a crown-land of the Austrian empire, formerly part of the kingdom of Illyria, has an area of 3,856 sq. m. with a pop. (1890) of 498,958, being a decrease of nearly 40,000 as compared with the census return of 1854. A continuation of the Carinthian Alps passes through it in the north, and the Julian Alps in the south. The scenery of the country abounds in interesting and singular features, amongst which one of the most notable is the rock-bridge of St. Kanzian, 130 ft. high, and 160 ft. broad, with a perfect arch 62 ft. high, and 154 ft. long. The Save is the principal river; the Kulpa is its chief tributary. The singular lake of Zirknitz (q. v.) is in Carniola. The climate of C. is in general mild, except in the high mountainous parts. The country does not produce corn or cattle enough to supply the wants of its inhabitants. Millet, pulse, and wild fruits are principal articles of food with many of the lower classes. Maize is cultivated in some places, and some districts yield excellent wines and much fine fruit. Flax is largely cultivated; silk is produced in some places, and much honey and beeswax. The principal products of the mineral kingdom are iron, quicksilver, and marble; the quicksilver mines of Idria are exceedingly productive. Linen weaving, and the manufacture of a coarse lace, are common among the peasantry. Laibach is the capital.

C. received its present name after the settlement here of the Slavonic Wends. Charlemagne conquered it and gave it to the dukes of Friuli. From 972 it had markgraves of its own, sometimes called dukes, who possessed, however, only a part of the country. On the extinction of the male line of the markgraves, part of the territory passed to the dukes of Austria, in the 13th c., and the remainder was acquired by them in the 14th. The vast majority of the inhabitants are Slavs of the Slovenian branch.

CARNIVAL (Ital. *carnovale*; from Lat. *carneleramen*, a solace of the flesh), a festival in Italy, which originally began on the feast of the Epiphany, and continued to Ash-Wednesday, when the fast of Lent made an end of the preceding feasting, masquerading, and buffoonery. In later times, the C. was limited to the time of from three to eight days before Ash-Wednesday. Without doubt, the forms and customs still preserved in the celebration of the C. originated in the heathen festivals of spring-time; and they still remind us, partly of the Lupercalia and Bacchanalia of southern Europe, and partly of the Yule-feast among northern peoples. Banquets of rich meats and drinking-bouts were the chief attractions of the C. during the middle ages. Shrovetide (q. v.), or Shrove-Tuesday, called also Fasten-even or Pancake-Tuesday, was a relic of the English C., and formerly a season of extraordinary sport and feasting. The rich commenced the festive time at the feast of Epiphany, or on "Three Kings' Day;" but the middle classes restricted their days of revelry to the week immediately preceding Lent; while the poor indulged in only a few days of mad mirth. According to a papal order, the clergy were allowed to commence their bacchanalia two days before the laity. The several chief days of C. had distinct names, such as "fat" or "greasy Sunday," "blue Monday" (or "fool's consecration"), etc. The Tuesday before the beginning of Lent was especially styled C.—the *Fastnacht* of the German people. The customs of making presents of green nosegays or garlands, and planting fir-trees before houses during C., remind us of the *thyrsus* of the ancient Bacchanals, and equally of the decorations of the Yule-tide or Christmas season among northern people. The ancient custom, also, of scourging women accidentally met with during the Lupercalia (q. v.), was preserved in the mediæval observance of the carnival. In most countries, especially where Protestantism prevails, the observance of the C. is now limited to dancing and masked balls on certain days; but in Italy, as Goethe says in his charming sketch of the Roman C., it is still a general popular festive time. In former times, Venice was distinguished by the pomp and splendor of the C.; but afterwards, Rome became most prominent. In the U. S.,

CARNIVORA.—1. Lion. 2. Lioness. 3. Lion's skull. 4. Tiger. 5. Jaguar. 6. Leopard. 7. Hyena. 8. Skull of hyena. 9. Gepard (leopard trained to hunt).

rd. 7. Serval. 8. Wild-cat. 9. Cat's skull. 10. Lynx. 11. Skull of lynx. 12. Spotted

the city of New Orleans is noted for the C. it holds on Shrove Tuesday, a celebration introduced by the French, and now comprising elaborately costumed processions, tableaux and balls.

CARNIVORA, a well-defined order of mammals, more or less efficiently adapted for predaceous life, and including most of the forms popularly known as beasts of prey. It partly corresponds with the order *feræ* defined by Linnaeus, but the latter included also marsupials and insectivora. Not all animals carnivorous in diet are C. in structure, for the dasyure or Tasmanian devil is a marsupial, and the blood-sucking *desmodus* is a bat. Nor are all the members of the order C. in diet purely carnivorous, for the polar bears eat grass greedily, the rats are very partial to honey, and many forms eat fruits, berries, insects, mollusks, or crustaceans in a highly omnivorous manner.

General Characters.—The dentition of most C. is very characteristic; there are in each jaw 6 pointed cutting teeth, 2 strong, sharp recurved canines, and molar teeth often adapted for cutting. The skull is short and dense. The lower jaw works up and down in a deep transverse semi-cylindrical groove, and there are deep hollows on the sides and prominent crests on the roof of the skull for the reception and insertion of the powerful muscles which work the jaw. The toes are clawed, with more or less pointed nails, almost always well developed. As one would expect in animals with a vigorous life-experience, the convolutions of the brain and olfactory lobes are well developed. In contrast to herbivorous animals, the stomach is simple, and the cæcum or blind process of the intestine is either absent or small. The placentation is deciduate and generally zonary. Carnivorous diet, vagrant predatory habit, fierce disposition, and high intelligence are familiarly characteristic.

Classification.—It becomes at once necessary to distinguish 2 sub-orders: (a) the typical, terrestrial C. (*fissipedia*), and (b) the aberrant, aquatic forms (*pinnipedia*), which may be thus contrasted.

FISSIPEDIA.

Terrestrial, at most partially aquatic.
Special cutting back tooth in each jaw.
Incisors almost always 3.
Strong curved sharp claws.
First and fifth digits of hind foot never longer than the others.

PINNIPEDIA.

Aquatic, except at birth.
Very uniform back teeth.
Always fever.
Webbed feet.
Outmost and inmost toes of hind foot predominate in length and strength.

The second sub-order, with its numerous adaptive characters, has doubtless been derived from the first, and is divided into 3 families, with about 50 species: (1) *otariidæ* (sea-bears), nearest the typical carnivores; (2), *tricheidæ* (walrus), and (3) *phocidæ* (seals). Some tertiary fossil forms are known, but they are not nearer the typical carnivores than those now existing.

Cuvier proposed to divide the typical carnivores into plantigrades, walking on the entire sole—e.g., bears; and digitigrades, walking on finger-tips—e.g., cats; but these physiological differences are rendered useless by the multitude of transitional links connecting them, and besides, as an accurate fact, the majority of carnivores belong to neither one form nor the other, but may be called sub-plantigrade. It is at once more accurate and useful to divide the typical carnivores into three sections, represented familiarly by bear, dog, and cat, and technically known as *arctoidea*, *cynoidea*, *æluroidæ*. The distinctions are based on certain features in the base of the skull, but are corroborated by other more general characteristics. There are about 300 living species.

(1) The *Arctoidea*, which are least specialized, and nearest the aquatic sub-order, include the following families: (a) *mustelidæ*—e.g., otter (*lutra*), sea-otter (*enhydra*), skunk (*mephitis*), sand-bear (*arctonyx*), badger (*meles*, *taxidea*), ratel (*mellivora*), grison (*galictis*), marten and sable (*mustela*), stoat or ermine (*putorius*), glutton (*gulo*), etc.; (b) *procyonidæ*—e.g., raccoon (*procyon*), coati (*nasua*), kinkajou (*cereoleptes*); (c) *ailuridæ*—e.g., panda (*ailurus*); (d) *ursidæ*—e.g., bear (*ursus*).

(2) The *Cynoidea*, occupying a medium position, include numerous forms in two series, represented by dog and fox.

(3) The *Æluroidæ*, comprising the most specialized carnivores, include 4 families: (a) *felidæ*—e.g., cat, lion, tiger, jaguar, cheetah (*felis*); (b) *viverridæ*—e.g., civet (*viverra*), binturong (*arctictis*), ichneumon (*herpestes*); (c) *hyænidæ*—e.g., aardwolf (*proteles*) and hyæna.

Pedigree and History.—The fossil history of C. is of great interest, for not only have some remarkable forms, like the sabre-toothed tiger (*machærodus*), (q.v.) been unearthed, but the various families are linked together, as the cats and civets, by *proviverra*, and the ancestors of at least the cats and the dogs are found in primitive generalized carnivores, such as *miacis*, *oxyæna*, and *arctocyon*. The group affords beautiful illustration of increasing and of divergent specialization, as illustrated in the passage from primitive forms to the lion, on the one hand, and the seal on the other. As to the relation of the C. to other orders of mammals, speculation is rife, but firmly based conclusions hard to find. Looking backward, some naturalists have discovered affinities with the marsupials, while others, looking forward, have with more abundant evidence regarded the primitive carnivores as ancestral to insectivora, and through them to cheiroptera. Some, again, find affinities between cetacea and carnivores, though this is vigorously denied by other

authorities. See Huxley, *Anatomy of Vertebrate Animals*; and Flower, *Osteology of Mammalia*.

CARNIVOROUS PLANTS. See DIONÆA; SUNDEW.

CARNOCHAN, JOHN MURRAY, b. Georgia, 1817; educated in Edinburgh; studied medicine and surgery with Dr. Mott of New York, beginning practice in 1847. Dr. Carnochan rapidly rose to the first rank among practicing physicians and surgeons, and acquired great celebrity for the boldness and success of his operations, such as the removal of the lower jaw; the cure of elephantiasis by ligature of the femoral artery; excision of the ulna and still preserving the arm with most of its functions; amputating the hip joint; and particularly for removing, in a case of neuralgia, the entire trunk of the second branch of the fifth pair of nerves. Dr. C. was professor of the principles and operations of surgery in the New York medical college, and health officer of the port. He published a number of important papers on medicine and surgery. D. 1887.

CARNOT, LAZARE NICOLAS MARGUERITE, b. May 13, 1753, at Nolay, in the department of Côte d'Or, Burgundy, gained distinction at an early period by his talents in mathematical science and military engineering. In 1791, he became a member of the legislative assembly, and, in the convention, voted for the death of Louis XVI. After taking the command of the army of the north, and gaining the victory of Wattignies, he was elected into the committee of public safety, in which he was intrusted with the chief direction of military affairs, and greatly contributed to the successes of the French army. Though he endeavored to restrict the power of Robespierre, he was accused, with others, after the reign of terror; but the charge was dismissed. In 1797, having opposed the extreme measures of Barras, his colleague in the directory, C., as a suspected royalist, was sentenced to deportation. He escaped into Germany, where he wrote his defense, which conduced to the overthrow of his colleagues in 1799. The 18th Brumaire brought him back to Paris, where he was made minister of war, 1800; and by his energy, skill, and fertility of administrative resource, helped to achieve the brilliant results of the Italian and Rhenish campaigns. He retired, however, from his office when he understood the ambitious plans of the emperor, but hastened, when he witnessed the reverses of the empire, to offer his services to Napoleon, who gave him the command of Antwerp in 1814, which he heroically defended. During the hundred days, he held office as minister of the interior; and after the second restoration, retired first to Warsaw, and next to Magdeburg, where he died, Aug. 2, 1823. Among C.'s numerous writings on mathematics and military tactics, etc., we may notice his *Essai sur les Machines en Général* (1786); *Réflexions sur la Métaphysique du Calcul Infinitésimal* (1797); and the *Géométrie de Position* (1813).—His son, LAZARE HIPPOLYTE CARNOT, b. at St. Omer, April 6, 1801, one of the leaders of the French democracy, was in early life a disciple of St. Simon, but, like others, left that school on account of the lax morals advocated by *Enfantin*—protesting against “the organization of adultery”—and devoted himself to the inculcation of a more orthodox and virtuous socialism in various periodicals. In 1847, he declared himself a republican in his brochure, *Les Radicaux et la Charte*; and, after the Feb. revolution, was appointed minister of public instruction, but not finding himself in sufficient rapport with his colleagues, he resigned. In 1863, he entered the corps législatif, and the national assembly in 1871. He wrote an *Exposé* of St. Simonianism and *Mémoires* of Henri Grégoire and of Barrère. D. 1888.—MARIE FRANÇOIS SADI CARNOT, president of the French republic, b. at Limoges, Aug. 11, 1837, was the oldest son of the last named. He studied at the École Polytechnique, and was by profession a civil engineer. In 1871 he was chosen to the national assembly, and was finance minister in the Brisson cabinet of 1879, as also in the Freycinet cabinet of 1887. In Dec., 1887, he was, on the resignation of Grévy, chosen president of the republic, a result largely due to the circumstance that the leading factions could not agree as to their special candidates. The president, who bore a high character for moderation and integrity, was fatally stabbed at Lyons, June 23, 1894, by an anarchist named Santo Caserio.

CARNUNTUM, an ancient t. in upper Pannonia, on the Danube, founded by the Celts, but at an early period a Roman post. Marcus Aurelius resided here for three years during his wars with the Marcomanni. In the 4th c. C. was destroyed by German invaders; it was afterward rebuilt, and finally destroyed in the Magyar wars of the middle ages.

CAROB, AL'GAROA, or LOCUST-TREE, *Ceratonia siliqua*, a tree of the natural order *leguminosæ*, suborder *cæsalpinieæ*, a native of the countries around the Mediterranean sea, in size and manner of growth much resembling the apple-tree, but with abruptly pinnate dark evergreen leaves, which have about two or three pair of large oval leaflets. The flowers are destitute of corolla; the fruit is a brown leathery pod, 4 to 8 in. long, a little curved, and containing a fleshy and at last spongy and mealy pulp, of an agreeable sweet taste, in which lie a number of shining brown seeds, somewhat resembling small flattened beans. The seeds are bitter and of no use, but the sweet pulp renders the pods an important article of food to the poorer classes of the countries in which the tree grows. They are very much used by the Moors and Arabs. They are also valuable as food for horses, for which they are much employed in the s. of Europe, and have of late years begun to be extensively imported into Britain, under the name of *locust beans*, which name and that of *St. John's bread* they have received in consequence of an ancient

opinion or tradition, that they are the "locusts" which formed the food of John the Baptist in the wilderness. It seems probable that they are the "husks" (*keration*) of the parable of the Prodigal son.—The Arabs make of the pulp of the C. a preserve like tamarinds, which is gently aperient.—The C. tree is too tender for the climate of Britain. Dr. Royle thinks its introduction into the n. of India would be an important addition to the resources of that country, and a valuable safeguard against famine. The produce is extremely abundant, some trees yielding as much as 800 or 900 lbs. of pods. The wood is hard, and much valued, and the bark and leaves are used for tanning.—The locust tree (q.v.) of America is quite distinct from this.

CAROL, a Christmas hymn that may be traced to the primitive church. It was customary to call upon such as could sing to praise God in a hymn, either out of the Scriptures or of their own invention; and it was also customary for bishops on Christmas day to make sport with their clergy, and to sing; which custom was in imitation of the *Gloria in Excelsis* of the angels. See CHRISTMAS CAROLS.

CAR'OLAN, or **O'CAROLAN**, TURLOGH, 1670-1738; one of the most noted of native Irish bards. When but 18 years old he became utterly blind, and thenceforward followed the profession of wandering minstrel, in which character he won great fame. The number of his compositions, to the greater part of which he fitted words, was about 200.

CAROLINA PINK. See SPIGELIA.

CAROLINA, MARIA, 1752-1814; daughter of Francis I. and Maria Theresa of Austria, and queen of Naples by her marriage with Ferdinand IV. in 1768. She had great influence with the king, leading him in 1798 to declare war against France, the consequence of which was the marching of the French upon Naples and the flight of Ferdinand and Carolina to British protection. After returning to Naples she conspired against Napoleon, and, with her husband, was again expelled. She died in Vienna before any further restoration to the throne.

CAROLINE, a co. in e. Maryland, on the Delaware border, intersected by branches of the Philadelphia, Wilmington, and Baltimore railroad; 315 sq. m.; pop. '90, 13,903, includ. colored. It has a level sandy surface, producing corn, oats, potatoes, etc. Co. seat, Denton.

CAROLINE, a co. in e. Virginia, on the Rappahannock river, and the Richmond, Fredericksburg and Potomac railroad; 515 sq. m.; pop. '90, 16,681, includ. colored. Productions, wheat, corn, oats, and tobacco. Co. seat, Bowling Green.

CAROLINE. See CARLINE.

CAROLINE, AMELIA ELIZABETH, wife of George IV. of Great Britain, was the second daughter of Charles William Ferdinand, duke of Brunswick Wolfenbüttel, and of the princess Augusta of Britain. She was born on the 17th May, 1768, and spent her youth under great restraint at her father's court. In 1795, she was married to the prince of Wales. The marriage was disagreeable to him, and although she bore him a daughter, the princess Charlotte, he separated from her immediately on her recovery from childbed; and she lived by herself in a country residence at Blackheath, the object of much sympathy, the people regarding her as the victim of her husband's love of vice. Reports to her discredit led the king, in 1808, to cause investigation to be made into her conduct, which was found to be imprudent, but not criminal. In 1814, she obtained leave to visit Brunswick, and afterwards to make a further tour. She visited the coasts of the Mediterranean, and lived for some time on the lake of Como, an Italian, by name Bergami, being all the while in her company. When her husband ascended the throne in 1820, she was offered an annuity of £50,000 sterling to renounce the title of queen, and live abroad; but she refused, and made a triumphal entry into London, whereupon the government instituted proceedings against her for adultery. Much that was very offensive was proved as to her conduct; but the manner in which she had been used by her husband, and the splendid defense of Brougham, caused such a general feeling in her favor, that the ministry were obliged to give up the divorce bill, after it had passed the house of lords. She now fully assumed the rank of royalty, but was refused coronation, and turned away from the door of Westminster Abbey on the day of the coronation of her husband. She died on 7th Aug., 1821.

CAROLINE BOOKS, four works drawn up at the request of Charlemagne against the decrees of the second council of Nice on the adoration of images, and contained in the *Capitulare Prolativum* of Charlemagne.

CAROLINE ISLANDS, or **NEW PHILIPPINES**, a widely scattered archipelago in the Pacific, n. of New Guinea and e. of the Philippines, between 3° and 11° n., and 135° and 137° e. The westernmost are known as the Pelew (q.v.) or Palau islands, and cover 190 sq.m. of land, being nearly encircled by a coral reef. The surface is well wooded, and the soil fertile, producing bread-fruit, cocoa-nuts, sugar-cane, oranges, bananas, etc., in abundance. Cattle, sheep, and hogs have been domesticated; there is a great variety of birds, and the lagoons abound with fish. The inhabitants are dark-colored, and evidently of Papuan and Malay blood. The islands, and most of the villages, form independent but co-operative republics. One of the most remarkable institutions is the "clöbbergall," a kind of union for mutual aid and defense. The women, too, have clöbbergalls of their own, and exercise much political influence. Up to the

close of the last century the people used stone instruments and weapons. Their currency consists of pieces, or pïeds, of ancient glass and enamel, to which they ascribe a divine origin. The population of the Caroline and Pelew islands is estimated at 36,000. They comprise between 400 and 500 islands, of about 360 sq. m. in all. Most of them are small atolls and uninhabited. They consist of many groups. The Matelotas group lies n.e. of the Pelews, and consists of three islands, thinly inhabited. Yap, or Guap, further n.e., is 10 m. long, and has a good harbor. The natives of Yap are more advanced in civilization than their neighbors; they cultivate the betel-nut with great care, build good boats, lay out regular villages, pave the streets, and build stone piers and wharves. A Spanish mission was established in 1856. The Ulea, Swede, and Lutke islands are unimportant. The Hugoleu (or Rug) group, discovered in 1824, are mountainous and wooded. They have an area of 50 square miles and a population of from 8,000 to 10,000. The Mortlack, or Young William's group consists of three islands, with a small population, of Samoan origin, who are the only idol-worshippers in all the archipelago. To the n.e. lies Ruven island, inhabited by immigrants of mixed foreign blood. The Seniavine group, comprising three islands, has a small colony of whites, and one of the islands has been the seat of an American mission since 1851. This island, called Ascencion by the French, is a rendezvous for whaling vessels. In the center is a remarkable pile of ruins which seem to have belonged to a fortification. Strong's island, in the center of the Carolines proper, is a volcanic upheaval, discovered by Crozier in 1804, and is now the seat of an American mission. The eastern Carolines, otherwise the Mulgrave archipelago, comprising the Radak or Marshall group, were annexed to Germany in 1886. See POLYNESIA. The sovereignty of Spain over the C. I. was formally admitted by Germany and England, 1885. See *illus.*, PAPUA AND CAROLINE ISLANDS, vol. XI.

CAROLINE MATILDA, 1751-75; sister of George III. of England; queen of Denmark, having married Christian VII. in 1768, by whom she became the mother of Frederick VI. Through the jealousy of the queen dowager and the king's step-mother, she was accused of infidelity, and the king, who had become weak-minded, if not idiotic, caused her and Struensee, her physician, to be arrested. The interference of the British minister saved the queen from death, but she was sent into Hanover, where she died of grief in the castle of Celle. See STRUENSEE.

CARON, RENÉ ÉDOUARD, b. Canada, 1800; educated in the Quebec seminary; admitted to the bar in 1826. He was mayor of Quebec 1827-37, and speaker of the legislative council 1843-47, and 1848-53; when he abandoned political life, and was appointed judge of the queen's bench. In 1857 he was commissioner for codifying the laws of Lower Canada, and in 1873 was appointed lieutenant-governor of Quebec. He d. in 1876.

CAROLUS-DURAN, ÉMILE AUGUSTE, b. Lille, France, 1838; portrait painter, pupil of Souchon. While living with the monks of Subiaco, at Rome, he painted "Evening Prayer" (in the Salon of 1863); received first medal for his *L'Assassiné*, 1866; was made chevalier of the legion of honor, 1889, and elected to the order of Léopold. He will be chiefly remembered as a portrait painter. His style is so subtle, vigorous, and original, that the critics find it difficult to classify him.

CAROTID ARTERY. The great artery which on each side distributes blood to the different parts of the head, appears to have derived its name either from Gr. *kara*, the head, or, more probably, from Gr. *karos*, sleep, there being an old idea, which the researches of Dr. Alexander Fleming have shown to be correct, that there was some connection between deep sleep and compression of these vessels.

Each C. A. consists of the primitive or common carotid, which, at the upper margin of the larynx or organ of voice, separates into two great divisions, of nearly equal size—the external and the internal carotid. The external carotid supplies the larynx, tongue, face, and scalp with blood; its principal branches being the superior thyroid, the lingual, the facial, the occipital, the posterior aural, the internal maxillary, and the temporal. The last-named artery is occasionally opened by the surgeon in preference to a vein, as, for example, in certain cases of cerebral apoplexy. The internal carotid enters the cavity of the cranium through a somewhat tortuous canal in the temporal bone, and after perforating the dura mater, or fibrous membrane of the brain, separates into the anterior and middle cerebral arteries, which are the principal arteries of the brain; while in its course through the dura mater, it gives off the ophthalmic artery, which subdivides into several small branches that supply the eye and surrounding parts. See CIRCULATION.

Surgery.—Wounds of the carotid trunks are generally from stabs. Suicides have a vague desire to cut them, but rarely cut sufficiently deep by the side of the windpipe. Of course, should either vessel be wounded, death results almost immediately. Punctured wounds, however, may not be immediately fatal; they may heal, or a false aneurism (q.v.) may result. Such an occurrence happened about twenty years ago in Scotland. A young man was stabbed close to the root of the neck; a pulsating tumor formed, which rapidly increased, and would undoubtedly have burst before long, had not prof. Syme of Edinburgh cut into it, and, by an operation requiring extraordinary courage and dexterity, tied the common C. A. above and below the part stabbed; thereby saving

not only the life of the patient, but that of the man who had inflicted the wound, and who was then in prison awaiting his trial.

Sir Astley Cooper was the first to tie the common carotid for spontaneous aneurism, in Nov., 1805; and since then, the operation has been successfully performed in a number of cases. Owing to the numerous interchange of branches between vessels of both sides of the head, cutting off the supply of blood through one carotid is seldom followed by affections of the brain. Such have, however, occurred in a few instances; but Dr. Mussey of America tied both carotids within twelve days of each other without any such result.

The common carotid in the horse is the termination of the right arteria innominata. It is a large vessel, about an inch long, which emerges from the chest below the wind-pipe, and divides into the *right* and *left* carotids. These bend upward, having the wind-pipe between them, gradually inclining inwards at the upper part, where each divides into external and internal carotid, and a large anastomosing branch arising from between these two.

CAROUGE, a t. of Switzerland, in the canton and about one m. s. of Geneva, on the left bank of the Arve. It is beautifully situated, regularly built, and surrounded by villas, orchards, and meadows. It has a handsome Roman Catholic and a Protestant church. There are manufactures of thread, clay pipes, leather, watches, and pottery. There is a bridge across the Arve connecting the town with Geneva. In 1780 the king of Sardinia, as ruler of Savoy, tried to set it up as the industrial rival of Geneva, but failed. Pop. about 5700.

CAROUS (a corruption, probably, of the French *carrosse*), a pivoted platform or gallery used in ancient ships of war. It was raised by means of tackles, and swung over the deck of another vessel, thus serving as a boarding bridge.

CARP, *Cyprinus carpio*, a fish of the family *Cyprinidæ* (q.v.), of which, indeed, it may be regarded as the type, a native of the central countries of Europe, and corresponding latitudes in Asia, but on account of its value as an article of food, long naturalized in many countries in which it is not indigenous. No fish, indeed, except its congener the goldfish, has been so much transported by man from one place to another; and this has been the more easily and successfully accomplished, that the C. can subsist longer than most fishes out of the water, if only kept moist. The C. is said not to be originally a native of England, but the statements sometimes made as to the time of its introduction are untrustworthy; it certainly existed in England before the 16th century. It is mentioned in the famous Boke of St. Albans, in 1486, by Dame Juliana Berners, as a "dayntous fysshe, but scarce." The C. spawns in May, and is out of condition until July. It does not succeed so well in Scotland, of which country it is certainly not a native, as in the s. of England; and in northern countries generally, it neither increases so rapidly in size, nor exhibits so great fecundity, as in more congenial climates. Its fecundity, in favorable circumstances, is prodigious; more than 700,000 eggs have been found in the ovaries of a single C. of moderate size. The C. is rather an inhabitant of lakes and ponds than of rivers, in which, if it is found, it shows a preference for the stillest parts. It feeds chiefly on aquatic plants, and may be fattened on lettuces and similar soft vegetables, for which its teeth are remarkably adapted, being few, mostly large, flat, and situated on the pharynx very far back in the mouth; worms, mollusks, and insects, however, form part of its food. It deposits its spawn on weeds. It is said to live to a great age, even 150 or 200 years; its scales, "like the productions of the cuticle in some other animals, becoming gray and white with age." It is known to attain the weight of 3 lbs. when six years old. A C. of 18 or 19 lbs. weight is deemed of extraordinary size in England, but one of 70 lbs. weight, and nearly 9 ft. long, was taken near Frankfort-on-the-Oder, and 30 or 40 lbs. is not an unusual size in some of the German lakes. In Austria and Prussia, many lakes and ponds are let at a high rent for the C. which they contain.—Of the other species of the genus *cyprinus*, as now restricted, which are found in Britain, none belong to the section having barbules at the angles of the mouth. See **CRUCIAN**, **GIBEL**, and **GOLDFISH**.

To the angler, the C. is not a very valuable fish, as he is by no means a free biter. When hooked, however, he runs strongly, and fights with considerable determination and cunning. In still water, the best means of fishing for C. is with a very light quill-float. A small piece of dead rush will answer the purpose equally well, or better. The float should be fixed on the line so that the bait may be *upon* the bottom, and if that be clear of weeds (the angler must take care that it is so), the C. will easily see and pick up the bait. It is advisable, however, in fishing for C. to use two rods, and the float to one of these should be so placed that the bait may be just *off* the bottom. The former tackle should be baited with well-scoured red worms, gentles, or grubs of some sort; the latter with a green pea, boiled wheat, or paste. The hooks should be of No. 8 size, and tolerably stout in the wire, and the gut perfectly round and good, and as fine as is consistent with the size of the fish angled for. In using green peas or wheat, boil until the skin cracks. Very small potatoes of the size of a bean have been known to attract good carp. The best paste is bread worked up with a little brandy or gin. Gentles, wasp grubs, flies, and other insects, worms, or caterpillars, may all, at times, take carp. When a C. bites, he nibbles at the bait for

some seconds before he takes it, and often takes off the tail of the worm, or strips the hook completely. But it is quite useless to strike until the float disappears entirely.

CARPÆDA, a dance in ancient Thessaly; a pantomime represented by two men, one a robber and the other a plowman, in which there was a contest for the possession of the plowman's oxen, which are finally captured by the robber. All the action was rhythmical, and performed much like a pantomime of the present day.

CARPATHIAN MOUNTAINS, the mountains which inclose Hungary and Transylvania on the n., e., and s. in a great semicircle (whose concavity is towards the s.w.), extending over a space of 800 m. from Presburg on the Danube to Orsova on the same river, between lat. 44° 30' to 49° 40' n., long. 17° to 26° east. The C. M. form part of the great mountain system of central Europe, separated from the mountains of Silesia and Moravia by the valley of the March, and from the Alps and Mt. Hæmus by the valley of the Danube. Almost the whole of the C. M. lie within the Austrian dominions. They form two great masses, one in Hungary to the n.w., and one in Transylvania to the s.e., with ranges of lower and wooded mountains between. The highest group of the Hungarian Carpathians is that of *Tatra* or the *Carpat*, in the very n. of Hungary, a majestic mass of granite mountains, exhibiting much grandeur in its naked precipices, and in some of its peaks rising to the height of more than 8,000 ft., the Lomnitz peak being 8,133 ft. high. On the northern declivity of the Eisthal peak exists the only glacier in the Carpathians. The Tatra group is penetrated by no valleys, but only by wild ravines, and is separated from the rest of the range by deep depressions. There is a great difference of climate between its southern and northern sides. These higher mountains yield few minerals, but the lower Carpathians of Hungary, which stretch around them in groups and ranges, abound in minerals of various kinds. The mines of Schemnitz (q.v.) are of great celebrity. Many of the Hungarian mountains are of limestone. The mountains of Transylvania are mostly of primitive rocks. On the eastern and southern borders, they reach the height of 9,000 ft. and upwards. Mt. Butschetje, the culminating peak, has an elevation of 9,528 ft. above the sea. The C. M. are generally clothed with wood to a height of more than 4,000 ft.—in some parts, forests are found at 5,500 ft.—and with steep precipices, narrow ravines, extinct craters, and cones of volcanic origin, they exhibit scenes of grandeur rarely exceeded. The lower parts of the mountains are beautifully clothed with vineyards, walnut groves, etc., above which ascend forests of cherry, beech, and pine. The ranges which connect the high mountains of Hungary with those of Transylvania are in great part composed of sandstone, have an unfruitful soil, and comparatively little population or cultivation.

CARPATHOS. See **SCARPANTO**.

CARPEAUX, JEAN BAPTISTE, 1827-75; a French sculptor, whose more conspicuous works are "The Fisher Boy," "Ugolino and his Children," "Neapolitan Fisherman," "Girl with a Shell," "France enlightening the World, and protecting Agriculture and Science," and the noted group, "La Danse," on the façade of the Paris opera-house.

CARPEL (Gr. *karpos*, fruit), in botany, a modified leaf forming the whole or part of the pistil of a flower. The number of ovaries and stigmas in the pistil depends on the number of carpels of which it is composed, but sometimes several are so intimately united that they appear as one. It is the upper surface of the leaf which forms the inner surface of the carpel. At its margins, the ovules are developed, like the buds formed on true leaves of some kinds of plants. The fruit, as well as the pistil, may therefore be said to be composed of one or more carpels.

CARPENTA'RIA, GULF OF, a broad and deep indentation of the n. coast of Australia, stretching from 11° to 17° 30' s. lat., and from 136° to 142° e. longitude. It is said to have been named from Carpenter, a Dutchman, who discovered and partly explored it in 1627. The gulf of C. contains many islands. The shores of the mainland are generally low; and in the rainy season the floods materially freshen the sea.

CARPENTER, FRANCIS BICKNELL, b. 1830; a portrait painter. His "Emancipation Proclamation" (1864), is in the National Capitol at Washington, and his "International Arbitration" (1891), was presented to Queen Victoria. He published *Six Months in the White House* (1866).

CARPENTER, LANT, LL.D., 1780-1840; an English Unitarian minister, successor of Dr. Kenrick at Exeter; afterwards in charge of a church in Bristol. He was much interested in the religious instruction of children, and established several Sunday-schools. Among his works are *An Introduction to the Geography of the New Testament*; *Unitarianism the Doctrine of the Gospel*; *Examination of the Charges against Unitarianism*; and *Harmony of the Gospels*. See *Life*, by R. L. Carpenter (1842).

CARPENTER, MARY, daughter of the Rev. Dr. Lant Carpenter, of Bristol, and sister of Dr. William Carpenter (b. 1807, d. 1877). She took an active part in the movement for the reformation of neglected children, and besides advocating their cause in her writings, she founded several reformatories for girls, one of which, the Redhedge Reformatory, she superintended. In the prosecution of her philanthropic labors she visited India three times, and in 1871 instituted the National Indian Association, whose journal

she edited. Besides her reformatory writings, she published *Our Convicts* (1864), a book which drew public attention to the treatment of young criminals; *The Last Days of the Rajah Rammohun Roy*; and *Six Months in India*.

CARPENTER, MATTHEW HALE, b. Vt., 1824; studied law with Rufus Choate; and in 1848 settled in Wisconsin, from which state he was returned as U. S. senator in 1868, and was re-elected in 1879. C. was an able lawyer and a brilliant debater. He d. 1881.

CARPENTER, WILLIAM BENJAMIN, M.D., LL.D., F.R.S., F.L.S., F.G.S.; 1813-85; one of the most distinguished physiologists and writers on physiology of the day. Soon after his graduation in Edinburgh in 1839, he published his *Principles of General and Comparative Physiology*, afterwards divided into *The Principles of Comparative Physiology*, and *The Principles of General Physiology*. These works, together with *The Principles of Human Physiology*, which originally appeared in 1846, and reached a fourth edition in 1853, and *The Principles of Mental Physiology* (Lond. 1874), form a perfect cyclopædia of biological science. Dr. C. likewise published *A Manual of Physiology*; *The Microscope, its Revelations and its Uses*; a prize essay upon *The Use and Abuse of Alcoholic Liquors*; and numerous memoirs on various departments of physiology, microscopical anatomy, and natural history, in the *Philosophical Transactions*, etc. His most important original researches are *On the Structure of Shells*; *On the Development of Purpura Lepillus*; and *On the Structure, Functions, and General History of the Foraminifera*. For several years he edited *The British and Foreign Medico-Chirurgical Review*, and he was one of the editors of *The Natural History Review*. In 1856, he became registrar of the university of London. He took a chief part in the government expeditions sent out in 1868-69-70 for deep-sea exploration in the n. Atlantic; and in consequence he contributed largely to the discussion of the vexed question of ocean circulation in the journal of the royal geographical society and other periodicals. In the art. ATLANTIC in the *Ency. Brit.*, 9th ed., his views will be found summarized. He advocated the doctrine of a vertical circulation sustained by opposition of temperature only, independent of and distinct from the horizontal currents produced by winds; see GULF STREAM. This doctrine was first advanced by Prof. Lenz of St. Petersburg in 1845; but Dr. C. was ignorant of this, when the deep-sea observations, begun in 1863, led him to an identical theory. In 1879 he resigned the registrarship of the univ. of London. In 1882 he visited the U. S.

CARPENTER, WILLIAM HENRY, b. at Utica, N. Y., 1853; entered the class of 1878 at Cornell University, but in the fall of the same year matriculated at the University of Leipzig for the study of Germanic philology and literature, paying special attention to the Scandinavian side of these subjects. He visited Denmark and Iceland, remaining in the latter country during the winter of 1879-80, returned to Leipzig in 1880 and soon afterward went to Freiburg, in Baden, where he took the degree of Doctor of Philosophy in 1881, returning in the same year to America. He was Fellow at Johns Hopkins University, 1881-83, and taught afterwards at Cornell and Columbia Universities, becoming professor of Germanic philology in the latter institution in 1895 and the head of the Germanic department upon the death of Prof. H. H. Boyesen in Oct. of that year. He has published *Grundriss der Neutisländischen Grammatik* (Leipzig, 1881); *Nikolas drapa Halls Prests*, an Icelandic poem (Halle, 1881), and has contributed numerous articles to magazines and journals at home and abroad. He has also written many articles on German, Dutch and Scandinavian subjects for prominent cyclopædias.

CARPENTER BEE, a name given to those bees that excavate their nests in wood. One of these, *xylocopa violacea*, has been already noticed, and its nest briefly described, in the article Bee (q.v.).

CARPENTRAS, a t. of France, in the department of Vaucluse, is situated on the left bank of the Auzon, about 15 m. n.e. of Avignon. This town was known to the Romans as *Carpentoracte*, and, among other remains, a triumphal arch attests their former presence here. It also contains a Gothic cathedral. For a time it was the residence of the papal court, Clement V. having removed to the town about 1313. Pop. '91, 9778.

CARPENTRY, is the art of framing timber for architectural and other purposes. Technically, the term is restricted to the framing of heavy work, such as the roofs, floorings, partitions, and all the wood-work concerned in maintaining the stability of an edifice, while the minor and ornamental fittings are called joinery; but popularly the workman who does either kind of work is called a carpenter.

The preliminary preparation of timber is the work of the sawyer, who, by the saw-mill or pit-saw, divides the trunks of trees into planks, etc.; these are further divided by the carpenter, who uses hand-saws of various kinds, according to the work. For dividing wood into separate pieces in the direction of the fiber, the *ripping-saw* is used; for cross cutting, or sawing thin pieces in the direction of their length, the common *hand-saw* or the finer-toothed *panel-saw*; for making an incision of a given depth, and for cutting small pieces across the fiber, the *tenon-saw*, the *sash-saw*, or *dovetail-saw* is used. These are thin saws, stiffened by a strong piece of metal at the back to prevent crippling. When a curved cut is to be made, a very narrow saw without a back, called a *compass-saw* or a *keyhole-saw*, is used. The general name for these is *turning-saws*; they have their plates thin and narrow towards the bottom, and each succeeding tooth finer, and the teeth are not bent on contrary sides of the plate for clearing, as in broad saws.

The surface of wood is smoothed by planing. According to the work, different kinds of planes are used: the *jack-plane*, which is large and rough, for taking away the rough of the saw; the *trying-plane*, for bringing the surface perfectly level and true, or the *long-plane* for the same purpose, where the work is of great length, as for the joining edges of long boards to be glued together. The *smoothing-plane*, which is much smaller than these, gives the smooth finished surface. The *spoke-shave*, a sort of plane with a double handle, is used for paring and smoothing rounded work.

Ornaamental moldings are cut by means of molding-planes, which have their cutting edges curved to the required pattern. A good stock of these is one of the most expensive items of the tool-chest.

The paring of wood, and the cutting of rectangular or prismatic cavities, notches, etc., are done by means of *chisels*. Those for cutting across the fiber are called *firmers* or *paring-chisels*; those for cutting deep and narrow cavities, *mortise-chisels*, which are made very thick and narrow, and fitted in the handles with a strong flange, to bear heavy blows with the mallet. Chisels for paring concave surfaces are called *gouges*. For boring holes, *brad-awls*, *gimlets*, *centerbits*, and *gouges* are used—the two latter are fixed in a *stock* or revolving handle, and are used for large holes. When it is required to ascertain if an angle be square, or of any given inclination, the *square*, or the *bevel* set to the required angle, is applied to test the work as it proceeds. When parallel edges are required, the *marking gauge* is used to draw the line to be worked to. When a simple straight line is required for working to, a piece of string is chalked, then stretched tightly over the wood and lifted in the middle, when, by its recoil, it strikes the wood and leaves a straight chalked line. The *straight-edge*, a strip of wood with one of its edges perfectly straight, is applied to detect superficial irregularities. The operation of planing the edge of a board straight is called *shooting*, and such edges are said to be *shot*. When the joiner requires to ascertain whether the surface of a piece of wood is all in one plane, he takes two slips of wood with edges perfectly straight and parallel, and of equal width; these slips, called *winding-sticks*, are placed edge upwards, one at each end, across the board, and the workman looks in the longitudinal direction of the board over the upper edges, and if the two edges be not in the same plane, the board is planed down at the elevated parts until it is *out of wind*. For setting work level, a spirit-level, set in a wooden frame, or a plumb-level is used. For further description of the tools alluded to above, and in the rest of this article, see the special articles.

When two pieces of timber have to be united at their ends, as in lengthening the beams for roofing, partitions, the masts and keels of ships, etc., the operation is called *scarfing*, and the joint a *scarf*. The methods of scarfing are very numerous; those figured below will serve to illustrate the principal.

The following are the principal rules for scarfing as stated by Tredgold.

The length of the scarf should be, if bolts are not used—in oak, ash, or elm, six times the depth of the beam; in fir, 12 times the depth of the beam. If bolts and indents are combined, the length of the scarf should be—in oak, ash, or elm, twice the depth of the beam; in fir, four times the depth. In scarfing beams to resist transverse strains, straps driven on tight are better than bolts. The sum of the areas of the bolts should not be less than one fifth the area of the beam, when a longitudinal strain is to be borne. No joint should be used in which shrinking or expansion can tend to tear the timbers. No joint can be made so strong as the timber itself. When two pieces of timber are connected so that the joint runs parallel with the fibers of both, it is called a *longitudinal joint*; but when the place of the joint is at right angles to the fibers of both, an *abutting joint*. A very short tenon is called a *stub tenon*. When a second minor tenon is made projecting from the principal tenon, it is called a *tusk tenon*.

For lighter joiner's work, other methods of framing are used, and adapted to the work—to boards generally instead of beams; thus, for example, the mortise and tenon joint, made oblong instead of square, is used in framing doors, shutters, drawing-boards, or any other kind of extended superficial work liable to warping. An outside frame or skeleton is made with a panel or panels in the middle, and each piece of the frame has the grain at right angles to the piece into which it is mortised, in order that they shall eventually correct the warping.

Dovetailing is extensively used for connecting boards at right or other angles, as in making boxes, drawers, etc. Common dovetailing is usually glued. Nails or pins and glue are used with the miter and other notched joints.

Boards may be united at their edges to form an extended surface, as a flat plank partition, etc., either by simple gluing of the shot edges, by a *rebate*, or by a planed groove and a corresponding projection. The rebate is cut by means of a rebating plane; that in the figure is combined with a bead, the usual joint for wooden partitions. The groove, a sort of extended mortise, is cut by a plane with a projecting iron called the *plow*.

In all cases where glue is used in joints, it should be applied to both surfaces, which should be rubbed and pressed together until nearly all the glue is forced out, then kept pressed by a cramp or weights. White lead is used for outside joints.

Special departments of this subject, such as roofs, staircases, etc., will be treated under their respective heads.

CARPET-BAGGER, a term of contempt applied by the people of the southern United States to a man who came from any other part of the union to live in the south, or to transact business there after the close of the civil war. The term has been extended so as to designate any person in any part of the country who has no fixed residence. In the unsettled condition of the southern states after the civil war, they furnished an inviting field for adventurers and demagogues, who gave some ground for the stigma which has largely attached to the name of carpet-bagger.

CARPET BUG (*Anthrenus Scrophulariæ*), an insect long known in Europe, and described by Linnæus, but comparatively recently introduced into the United States. It appears to have been first noticed in carpets in Buffalo, N. Y., in 1872. Public attention was called to its ravages by newspaper articles published in New York in the summer of 1874. As early as 1850, however, another variety of the species (*anthrenus lepidus*) was seen on flowers in California. The larva is the form in which it comes under the notice of housekeepers and in which it commits its ravages. The larva, including its terminal bunch of hairs, is about three-eighths of an inch in length. It is marked by rings banded with dark brown, its head has a bunch of dark brown hairs, and long brown bristly hairs pointing backward project from its sides. The terminal bunch of hairs is often as long as the perfect larva. The larva casts its skin several times during the course of its growth. In autumn, the pupa is formed within the split skin of the larva. The perfect insect or beetle is formed in the winter, and in May is often found on the windows of infested rooms. The beetle is small, its average length being one eighth and its breadth one-twelfth of an inch. It is black in color, marked along the back with a central red line, and with red and white spots on the wing covers. The larvæ are active in the summer months. Their special home is in the borders of carpets, near the walls. Here they eat large irregular holes, or else cut a straight line, following the joinings of the floor. A favorite place of gathering is round the tacks with which the carpet is fastened. The larvæ, if left unchecked, overrun houses, devouring woollen fabrics especially. Various means have been tried to check this pest. Soft tallow has been poured into the crevices of floors and tallowed paper laid beneath the borders of carpets. Kerosene oil and benzine are useful. Fresh and pure Dalmatian insect powder has been of service. Carpets left unnailed at the borders are less exposed to injury, while they offer ready means for the discovery of the first attack.

CARPETS. Woven C., such as are now so common in this country, were first used in the east, where the custom of sitting cross-legged on the floor still renders them especially useful. Our rude forefathers covered the floors of their houses with rushes, hair, or straw; and in Norwegian farm-houses, where so many of our ancient customs still exist, the floor of the best room is commonly strewn with juniper-twigs. The first step towards a woven carpet was made by plaiting rushes to form a matting.

The principal varieties of C. now in use are the Turkey, the Axminster, the Brussels, the Wilton, the Venetian, the Dutch, the Kidderminster or Scotch, Whytock's tapestry and velvet pile, and the printed felt carpet.

The real Turkey carpet is made in one piece; those manufactured for the orientals are usually too small for use in this country. The patterns consist merely of curved and angular strips, of variegated but dark and unobtrusive colors. The warp is of strong linen or cotton, to which bunches or tufts of colored worsted are tied according to the pattern, a drawing of which is placed before the weaver to copy. The surface is afterwards shorn level. Rugs are made in a similar manner; the colored worsteds are tied very rapidly by young girls.

The *Axminster carpet* is merely the English-made Turkey carpet, formerly manufactured as above at Axminster, in Devonshire. They are usually made to order, and of the size required for the room; from the tedious nature of the process of manufacture, they are very expensive.

Templeton's patent Axminster carpet is a very beautiful fabric, very much resembling that from which it derives its name, but it is wrought on the chenille principle.

The *Brussels carpet* is a mixture of linen and worsted, but, like the Turkey carpet, the worsted only is shown on the upper surface. The basis or cloth is a coarse linen fabric, and between the upper and under threads of the weft, several (usually five) worsted threads of different colors are firmly bound in. The pattern is produced by drawing to the surface, between each reticulation of the cloth basis, a portion of the worsted thread of the color required at that spot to produce the pattern; these updrawn portions are formed into loops, by being turned over wires, which are afterwards withdrawn, and the loops thus left standing above the basis form the figured surface of the carpet. The machinery and processes by which this arrangement is produced are rather complex, and require to be seen to be fully understood.

The *Wilton carpet* is made like the Brussels, but the wire has a groove in its upper surface, and instead of being drawn out, it is liberated by passing a sharp knife through the worsted loop into this groove, and thus making a velvet pile surface instead of the looped thread.

The *Venetian carpet* is produced in a common loom, and the pattern is all in the warp, which alone is visible, as it incloses the weft between its upper and under surfaces. The patterns are generally checks or stripes; the latter are chiefly used for stair carpets.

The *Dutch carpet* is a coarser and cheaper variety of plain Venetian, sometimes made wholly of hemp, or of a mixture of coarse wool and cow-hair.

The *Kidderminster* or *Scotch carpet* has usually a worsted warp and woolen weft, and the pattern is made by the combination of the colors of each. Three-ply C. of this kind are made especially in Kilmarnock. This is the most durable of the moderate-priced C.: the patterns are not so brilliant as those of the Brussels or the tapestry, but, being ingrained and woolen throughout, they retain their character until worn through. This, and the three immediately preceding descriptions of carpet, exhibit their patterns nearly similar on both sides, and are therefore reversible.

Whytock's tapestry and velvet pile carpet, as it is now frequently called, is becoming very extensively used as a cheap substitute for Brussels and Wilton, which it is made to resemble very closely in the brilliancy and variety of pattern. The manufacture of this carpet is very curious and ingenious. Instead of five colored yarns, only one of which is drawn to the surface at any one place, while the other four remain buried between the upper and under threads of the cloth basis, a single colored yarn is used, and the variety of color produced by dyeing it of various colors at intervals of its length. The yarn is coiled upon a drum, and printed by means of rollers in such a manner that when the threads that encompass the roller shall be uncoiled and laid in line side by side, they shall present an elongated printing of the pattern, so that a rose, for example, the outline of which should be nearly circular, will be an oval, with length equal to four times its breadth. When, however the thread is looped over the wire, 4 in. of yarn being used for an inch of the carpet pattern, this elongation is exactly compensated, and the rose appears in its proper proportions. The machinery required for this is, of course, much simpler than that for the Brussels, only one yarn having to be looped, and that always in the same manner.

In the United States among the great centres of carpet manufacture are Philadelphia; Amsterdam and Yonkers, N. Y.; Hartford, Conn.; Lowell, Clinton, and Worcester, Mass.; and Baltimore, Md. As early as 1836, Brussels carpets were made by hand in Philadelphia, Auburn, N. Y., prison, and a few other places; and to the invention of the power-loom by Erastus B. Bigelow (q.v.) is chiefly due the rapid progress of the industry. In 1886 it was estimated that there were in the U. S. 1197 Brussels looms, producing annually, if all running, goods valued at \$17,955,000, and 1510 tapestry looms, which under the same conditions would yield a product worth \$13,590,000.

CARPINI, JOHANNES DE PLANO, a celebrated Franciscan monk, b. in Capitanata, Naples, about 1210; was one of the six friars selected by pope Innocent IV. to proceed to the court of the emperor of the Mongols, whose warlike advances in 1246 threw Christendom into consternation, in order to pacify the terrible nomadic warriors, and, if possible, convert them to Christianity. The mission, accomplished under dreadful hardships, though without results so far as its main objects were concerned, was nevertheless far from unfruitful. Prior to this, the most monstrous fables had prevailed regarding the Tartars; and C.'s narrative, which gave a truthful and striking picture of their numbers, character, and civilization, was the first to bring these myths into discredit. In this book he also argued, with great good sense, for a union amongst Christian princes, as the only means of resisting those fierce hordes in their progress westward. As a book of travels, its accuracy has been attested by modern travelers. Hakluyt copied most of this work, at second-hand, into his first volume of *Navigations and Discoveries*.

CARPOCRATES, or CARPOCRAS, flourished under Hadrian (130 A.D.) at Alexandria, where he founded the Gnostic sect of Carpocratians. According to him, the essence of true religion consisted in the union of the soul with the Monas or highest God, by means of contemplation, which elevated it above the superstitions of the popular faith, and liberated it from the necessity of submitting to the common laws of society. He only is to be reckoned wise who attains to this. Among those who have done so, are Jesus, Pythagoras, Plato, and Aristotle. The cosmogony of C. was of the usual Gnostic character, the central peculiarity of which was the belief that the worlds were created by angels. C. also held the doctrine of the transmigration of souls. His followers existed down to the 6th century. Whether or not they were guilty of the abominations ascribed to them, is more than we can positively affirm.

CAR POLITES, a generic term applied to fossil fruits, which, in the present state of our knowledge, it is impossible to refer more precisely to their place in the vegetable kingdom. Of 100 species described, 70 belong to the carboniferous system.

CARPUS, CARPAL BONES. See HAND, FOOT, SKELETON.

CARPZOV, a Saxon family descended from Simon Carpzov, burgomaster of Brandenburg about the middle of the 16th century. He left two sons—Benedict and Simon. **BENEDICT**, 1565–1624, was a jurist and professor of law at Wittenberg; and in 1602, chancellor to Sophia, electress of Saxony. He died at Wittenberg, leaving five sons. **JOACHIM**, the eldest son of the burgomaster, reached a high position in the Danish army. **BENEDICT**, the second of the five, 1595–1666, was a professor at Leipsic, ordinary of the faculty of jurists at the same university, and in 1653, privy counselor at Dresden. He published several works which had much influence in the administration of justice. His later years were spent in religious study. **AUGUST**, 1612–83, his brother and the fourth son of the first Benedict, was distinguished as a diplomatist, was chancellor of the consistory at Coburg, and at the time of his death a privy counselor at Gotha. He was a man of

piety, and the author of several devotional works. JOHANN BENEDICT, 1607-57, fifth son of the first Benedict, was professor of theology at Leipsic, and the author of a system of theology and other works of that nature. He also left five sons, all of whom obtained conspicuous reputation. One of the five was JOHANN GOTLOB, 1679-1767, who became an eminent theologian and professor of oriental languages at Leipsic. He wrote an introduction to the canonical books of the Old Testament, and a *Critica Sacra Veteris Testamenti*. JOHANN BENEDICT, grandson of the first Johann Benedict, 1720-1803, was professor of philosophy at Leipsic, and professor of poetry and Greek at Helmstadt, and professor of theology. He wrote many philological works, and ended his life as an abbot.

CARQUÍNEZ, or KARQUENAS, a strait in California, between Suisun and San Pablo bays, 7 m. long, navigable for steamboats, and for large vessels as far as Benicia.

CARE, DABNEY, 1744-73; a brother-in-law of Thomas Jefferson, and an eloquent member of the Virginia colonial legislature.

CARR, Sir ROBERT, d. Rhode Island, 1667; one of the English commissioners to New England, appointed by Charles II., the others being Nichols, Maverick, and Cartwright. After the capture of New Amsterdam (New York) from the Dutch in 1664 by Nichols, C. compelled the Dutch and Swedes on the Delaware to submit to a capitulation. He then went with the other commissioners to Boston, where they administered the government.

CARRACA, LA, a t. of Andalusia, Spain, one of the chief naval arsenals of the kingdom, is situated 4 m. e.s.e. of Cadiz. It has been completely isolated from the mainland by artificial means; and so low is its situation, that it was necessary to erect the buildings on piles. It is defended by forts, and is altogether very complete as an arsenal.

CARRACCI. See BOLOGNESE SCHOOL.

CARRAGEEN, often incorrectly called C. moss, or IRISH Moss, a sea-weed (natural order, *algæ*; sub-order, *ceramiales*), or rather several species of sea-weed, now used to a considerable extent both medicinally and as an article of food. The name C. is originally Irish; and the use of these sea-weeds appears to have been entirely confined to the peasantry of the coasts of Ireland, until, about 30 years since, they were recommended to general notice, and their medicinal virtues proclaimed by Mr. Todhunter, of Dublin. They are, however, found on the rocky sea-shores of most parts of Europe, and of the eastern shores of North America. The species which principally constitutes the C. of commerce is *chondrus crispus*, of which the varieties are remarkably numerous. It is 2 to 12 in. long, branched by repeated forking, cartilaginous, flexible, reddish-brown. *C. mamillosus* also frequently occurs. C., after being collected, is washed, bleached by exposure to the sun, dried, and packed up for the market. Its composition is as follows:

Vegetable jelly (carrageenin).....	79.1
Mucus.....	9.5
Two resins.....	0.7
Ash.....	2.0
Fiber and water.....	8.7

100.0

When treated for ten minutes with cold water, in the proportion of half an ounce of C. to three pints of water, and then boiled and strained, it yields, with or without spices, a very pleasant drink. With a larger proportion of C., a thickish liquid or *mucilage* is obtained; and on boiling down this decoction, and cooling, a stiff *jelly* is procured. Milk may be employed, instead of water, in the preparation of the various decoctions; and with the stronger one, along with sugar and spices, when thrown into a mold, a kind of *blanc mange* is obtained. C. is valued on account of its emollient and demulcent properties, and is likely to be found useful in most of those cases in which iodine might be exhibited; but its value seems to depend not a little on its being at once nutritious, a pleasant article of food, and easy of digestion. See GELATINE. It has been much recommended in pulmonary consumption. In some parts of Ireland, C. boiled with water (mucilage) is used instead of size for mixing with the more common colors in house-painting.

CARRANZA, BARTOLEMÉ DE, 1503-76; a Spanish theologian of the Dominican order, a man of great learning and eloquence. Charles V. sent him as envoy to the council of Trent, where he maintained that it was the duty of priests to reside in their benefices. He accompanied the prince, afterwards Philip II., to England, where he went to settle the marriage with Mary. In England, Carranza became queen Mary's confessor, and worked hard for the re-establishment of Roman Catholicism. Philip made him archbishop of Toledo, an appointment that aroused such jealousy that Carranza was denounced as a heretic. He was kept in prison eight years, thence taken to Rome and kept in prison, being at last compelled to abjure opinions which he had never held. He was then degraded from his office and sent to a convent, where he died seven days afterwards. He was afterwards honored as a saint by the Spanish people.

CARRAPA'TO, a species of tick (q.v.) of the genus *ixodes*, which infests dry bushy places in the interior of Brazil, hanging in clusters of many hundreds on very slender twigs, and ready to attach itself to any quadruped or man that passes, instantly burying its beak in the skin, from which it cannot be detached without considerable force. Horses and oxen suffer very much from the attacks of the C., of which in dry seasons the numbers are so great that whole herds of cattle are destroyed by the exhaustion which they produce.

CARRA'RA, a t. of northern Italy, 60 m. s.w. of Modena. It is situated on the Avenza, near its mouth in the Mediterranean, and is surrounded by the marble hills which have made its celebrity. Many of the principal buildings are wholly or partially constructed of the inferior kinds of white marble. There are upwards of 80 marble quarries in the vicinity of the town, but not more than 6 or 7 furnish the marble used for statuary. Extensive works, fitted up with English machinery for sawing the marble, have been established near the town, in which are several shops for the sale of marble ornaments. Many foreign artists have set up their studios here, in order to save the expense which the export of the marble in its rough state entails. C. has a fine collegiate church of the 13th and 15th centuries, with some good sculptures, an academy of fine arts, and a population of about 25,000. The quarries have been worked for more than 2000 years.

The famous **CARRARA MARBLE** is a white saccharine limestone, which derives its value to the sculptor from its texture and purity. It was formerly supposed to belong to the primitive rocks, but is now known to be a limestone of the oolitic period, highly altered by plutonic action.

CARREL, **NICOLAS ARMAND**, a French publicist and republican leader, was b. at Rouen in 1800, and was educated in the military school of St. Cyr. After serving for some years in the army, he went to Paris, and devoted his attention to political and historical studies. In 1830, in connection with Thiers and Mignet, he became editor of the *National*, the most spirited and able of the journals opposed to the government of Charles X. C.'s colleagues being employed by the new government, he was left to conduct the *National* himself, which he did with a spirit and a freedom such as had not been witnessed in France for a long time—which on more than one occasion checked the arbitrary power government attempted to exercise, and gained for him the high admiration and esteem of the popular party. Government prosecutions of course followed his outspokenness, and heavy fines were decreed against him; but these were paid by public subscription, and each conviction only made his journal more famous. C., however, dreaded revolution as much as he hated despotism, and had no sympathy with many of those who looked up to him as a leader. Provoked into a duel with Émile de Girardin, by an attack on his personal character, C. was mortally wounded, and died July 24, 1836. His funeral was attended by many of the most distinguished men in France.

CARREÑO, **THERESA**, pianist, b. in Caraccas, Venezuela, Dec. 22, 1853. She studied under her father, Manuel Antonio Carreño, and in 1862 appeared at a concert in New York, where she attracted the attention of Gottschalk, who taught her his own compositions. She went to Europe in 1866, and was married to Émile Sauret, the violinist, Giovanni Tagliapietra, the baritone, and Eugen d'Albert. She gave concerts in many parts of America, and met with great success. She published compositions for the pianoforte.

CARRE'RA, **RAFAEL**, 1814-65; a Guatemalan of Indian and negro blood, who in 1837 led a band of insurgents and the next year captured the city of Guatemala. In 1839, he again held the city by force. In 1847, he was elected president of the republic, and in 1851, re-elected for life. In 1863, he made war on San Salvador, captured the capital, and expelled the president. Though almost a savage, and without education, his government on the whole was mild and reasonable.

CARRIACOU', one of the West India islands, 20 m. n.e. of Grenada; 7 m. long by 3 wide. Cotton is the chief production.

CARRIAGE. See **COACH**.

CARRIAGE DOG, or **DALMATIAN DOG**, a variety of dog resembling the modern pointer in its shape and size, but less sagacious and keen in scent. It is often kept in stables, becomes attached to the horses, and may often be seen running after or under carriages. It also is called coach-dog. Its proper color is white with small black spots regularly distributed over its body, ears, and tail. The hair is short, and the tail has no brush. The disposition of the dog is inoffensive. The name Dalmatian is somewhat misleading, for the probability is that the breed was brought from India.

CARRICAL, or **KARIKAL**, a French port within the limits of Tanjore, a district of the presidency of Madras. It stands in lat. 10° 55' n., and long. 79° 53' e., on the estuary of a small branch of the Cauvery, a tributary of the bay of Bengal. C. is accessible from the sea only after the periodical rains, and then only for coasting craft. The town and territory contain 63 sq. m., and about 50,000 inhabitants. The settlement, originally ceded to France by a native grant in 1759, and subsequently subdued by the British, was restored in 1814, on condition of being neither fortified nor garrisoned.

CARRICKFERGUS, a seaport t. of Ireland, is situated on the lough of Belfast, about 10 m. distant from the town of that name. Though locally within the co. of Antrim, it forms a co. of itself. C. extends nearly a mile along the north-western shore of the lough. Its chief feature is its castle, a fine picturesque object, supposed to have been erected by De Courcy in the 12th century. It is situated on a rock about 80 ft. high, projecting boldly into the sea, by which it is surrounded on three sides. The bal-lum or keep is 90 ft. in height. From the top of the keep a splendid view is obtained, extending, in a clear atmosphere, to the Mourne mountains and the Scotch coast. The castle contains a barrack, bomb-proof magazine, and ordnance store-rooms; and for many years, 22 pieces of ordnance, 12-pounders, were mounted on the works. A total change has, however, been made in the defense of the castle, and cannon of a very large caliber are now mounted, in order to command the entrance of the lough. In 1575, a wall 16 ft. high and 7 thick, with 7 bastions, to surround the town, was commenced, and completed in the year 1608; a considerable portion of the wall is still standing, and one of the 4 entrance-gates. On the 14th June, 1690, king William III. landed here with his army, 12 days before the battle of the Boyne. The rock on which the king stepped on landing is at the end of the quay, projecting from it, and still forming the landing-place. In 1760, commodore Thurot captured the castle, but on the approach of troops from Belfast, was forced to abandon it. The parish church, said to have been founded in the year 1164, on the site of a pagan temple, is a fine old building, dedicated to St. Nicholas. There are several other churches and chapels in the town., and several good day and Sunday schools in connection with the religious bodies, and a fine model school has been erected by the national board. There is a literary and scientific society, with reading-room, library, and museum. The fishery of the bay, which is famous for oysters of an unusual size, employs a good number of the inhabitants. There are spinning-mills, bleaching establishments, and manufactures of linen and cotton fabrics. A market is held every Monday and Saturday, and a fair twice a year. Pop. '91, about 8900. Till 1885 it was a parliamentary borough. There are several barrows or tumuli in the vicinity. C. is connected by railway with Belfast, Portrush, and Larne. A few years since, a shaft was opened by the marquis of Downshire, in the hope of finding coal—without success; but salt of a superior quality, and in great abundance, was found. A company has been formed, and are working the mine. The length and breadth of the co. are nearly equal—about 5 statute miles.

CARRICK-ON-SUIR, a t. of Tipperary, situated, as its name implies, on the Suir, which is navigable at this point, 12 m. e. of Clonmel, in the midst of very fine scenery. Pop. about 6000. C. was formerly celebrated for its woolen manufacture, which has recently been considerably revived, and there are also linen and flax factories. It exports much agricultural produce. In the vicinity are good slate quarries. C. became a place of note soon after the Norman conquest. There are the remains of a castle built in 1309, on the site of an old priory of the Knights of St. John of Jerusalem.

CARRICK'S FORD, on Cheat river in West Virginia, where, July 13, 1861, a confederate force under Gen. R. B. Garnett was routed by a federal force under Gen. T. A. Morris, and of the confederates several were killed.

CARRIER, JEAN BAPTISTE, one of the most infamous and blood-thirsty members of the French national convention, was b. at the village of Yolai, near Aurillac, in Haut-Auvergne, in 1756. Entering the national convention in 1792, he took an active part in the formation of the revolutionary tribunal, voted for the death of the king, demanded the arrest of the duke of Orleans, and assisted in the overthrow of the Girondists. At Nantes, whither he was sent on a mission against the moderates, in Oct., 1793, he found ample means for indulging his insatiable thirst for human blood. The utter defeat of the Vendéans had filled the prisons with captives, and C. proposed and carried a resolution for murdering the unhappy prisoners *en masse*. Accordingly, on Nov. 15, he compelled 94 priests to embark in a vessel, under pretense of deportation, and during the night drowned the whole of them, by having the ship scuttled. Another of these *noyades*, as they were called, in which 138 persons were sacrificed, took place soon after, and they were repeated to the number of 25, their perpetrators facetiously terming them "vertical deportations." Other cruelties C. committed here. Men and women were tied together feet and hands, and thrown into the Loire; and this was called *mariage republicain* (republican marriage). With such recklessness were these murders committed, that, in one instance, a number of foreign war-prisoners were drowned by mistake. The water of the Loire was so poisoned by corpses, that its use for drinking and cooking was prohibited. Five hundred political prisoners were shot, as in a battue, on the bridge near Nantes. Even Robespierre was offended by these enormities, and recalled C., who boldly justified his own conduct before the convention. The fall of Robespierre was, however, soon followed by outcries against Carrier; judgment was decreed against him, and he perished under the guillotine, Dec. 16, 1794—dying with the protestation that, in all his cruelties, he had acted according to orders, and as a true republican patriot.

CARRIERE, MORITZ, b. 1817; a German scholar, professor of philosophy at Giessen and Munich, and author of many works on philosophy, religion, æsthetics, poetry, etc.

He was a pronounced liberal, going so far as to advocate the conversion of the cathedral at Cologne into a free church. He was also an art critic of high rank. He d. in 1895.

CARRIER PIGEON, a variety of the domestic pigeon (q.v.), remarkable for the degree in which it possesses the instinct and power of returning from a distance to its accustomed home; and which has been, therefore, much employed to convey letters from one place to another. In eastern countries, where such messengers are most frequently employed, it is the practice to bathe the pigeon's feet in vinegar to keep them cool, and to prevent it from alighting in quest of water, by which the letter might sustain injury. Pigeons intended for this use, must be brought from the place to which they are to return, within a short period, not exceeding a fortnight of their being let loose, and at a time when they have young in their nest; the remarkable fecundity of the C. P. affording particular facilities for its employment in this way. The bird is also kept in the dark and without food, for at least eight hours before being let loose. The instinct by which it is guided, like most other instincts, has received no sufficient explanation. That it recognizes objects by sight, and so directs its course, is nothing more than a conjecture, and as such, is only very partially supported by the fact of the great power of vision which these birds, in common with so many others, are known to possess, and by that of the C. P., on being let loose, immediately rising spirally to a great height in the air, as if to obtain opportunity for the exercise of this power. The C. P. has probably been more used in the Turkish dominions than in any other part of the world; and during the siege of Paris in 1871, it safely conveyed many important messages. Its rate of flight is not less than 30 m. an hour, and it has been known to pass over great distances still more rapidly. The variety generally described as the C. P. (*columba tabellaria* of Linnæus, *C. Turcica* of some authors, but not generally regarded by naturalists as a distinct species), is of remarkably large size, about 15 in. in length from the point of the bill to the extremity of the tail, and has the cere very large and carunculated, the eyes surrounded with a broad circle of naked red skin, and the wings reaching nearly to the extremity of the tail. There is, however, a smaller variety, which is said to be superior to it, and which has not the carunculated cere, nor the broad circle around the eye. Carrier pigeons are trained by being conveyed, when young, to short distances of a few miles from home and then let loose, the distance being gradually increased; and this training is said to render them much more secure as messengers. After the Franco-German war, nearly every continental nation of Europe organized regular "military pigeon systems." By the use of microscopic photography as many as 30,000 despatches can be sent on thin films or pellicles of collodion by the agency of a single bird. In 1886, a pigeon owned in Germantown, Pa., flew 451 miles in nine hours and eighteen minutes.

CARRIERS, a class of persons who, in various forms, by land and sea, undertake the carrying of goods, particularly articles of commerce. In all countries aspiring to commercial intercourse, the CARRYING TRADE, as it is called, has been less or more developed. The method of carrying in Arabia, Persia, and some other countries in the east has, till the present time, been chiefly by means of the camel, an animal of great value, on account of its strength, patience, and power of endurance. See CAMEL. In England and Scotland, previous to general use of the wheel-carriages, goods were carried on pack-horses, as is still practiced in some parts of Spain with mules. See PACK-HORSE, also MULE. After the pack-horse came the one-horse cart and the four-wheeled wagon, as engines of land-conveyance. Carrying with one-horse carts settled down as a universal practice in Scotland, where it is still conducted in all districts not traversed by railways. The Scotch C., winding their way by roads over hill and dale, at the rate of about 20 m. a day, have ever been a respectable and useful body of men, exceedingly trustworthy, and moderate in their charges. In connection with Edinburgh, Glasgow, and other centers of traffic, they travel to and from provincial towns for the most part once a week on certain days, so that their arrival at any particular place may be reckoned on with great exactness. In England, the employing of wagons for carrying goods in connection with the metropolis and provincial towns is now of old date. These carriers' wagons, greatly limited in their range by the introduction of canals and railways, are still to be seen in some of the rural districts. A wagon of this kind is provided with four broad huge wheels; and being a heavy and clumsy engine of conveyance, is drawn by four horses, though, when roads were bad in old times, six horses were not unusual. The driver ordinarily rode on a pony alongside the vehicle; now he more frequently walks, carrying a long whip. The wagon has a hooped top with movable covering; and the hinder part has always been left vacant for the use of passengers, who are necessarily huddled together on straw. Traveling in the "tail of the wagon" is now entirely gone, or nearly so; but with all its rude inconveniences, it was common till past the middle of the 18th c., and has afforded scope for some of the most grotesque descriptions of Fielding and Smollett. The tedious process of carriage by these wagons largely increased the prices of goods, and retarded the growth of commerce. The first modification in the carrying trade took place by means of inland navigation, to which reference has already been made. See CANAL. The conveyance of cotton goods from Lancashire, of earthenware from Staffordshire, of metal goods from Birmingham, of salt from Cheshire, etc., became much more easy than before, owing to the large quantity which could be packed in each barge, and to the great amount of work done by each horse. The chief owners of the old wagons became, in time, the chief owners of the

canal-boats; they paid rates or tolls to the canal companies. The celebrated English firm of Pickford & Co. has been for many generations, and still is, at the head of the goods carrying trade.

When railways were established, a great struggle ensued; the owners of the road-wagons and canal barges had a formidable competition. They wisely accommodated themselves to a state of things which they could not prevent, and added the trade of railway goods C. to their former business. Three systems were tried: 1. The company purchased road-wagons or vans, collected goods at the various towns, conveyed them by railway, and then distributed them at their several destinations. 2. The company confined their attention to the mere conveyance on their railway, leaving the collection and delivery to the ordinary carriers. 3. The company combined both systems, conveying on the railway everything that offered, and competing with the C. for the road-traffic. During the greater portion of the period in which the railway system has been in operation, the second of the above three plans has been adopted more extensively than either of the others. Taking as examples the greatest railway company and the greatest carrying firm, Messrs. Pickford had warehouses or depots at all the principal towns where the London and North-western railway had stations. The merchants and manufacturers were customers, not to the company, but to the firm, for the conveyance of merchandise. Messrs. Pickford employed their own wagons and horses, clerks and porters, in collecting and delivering goods, and paid to the company so much per ton for the conveyance along the railway, the toll varying according to the nature of the goods and the distance run. There was seldom any quarrels or disputes under this system. The carrier was responsible to the customer from first to last for the safety of the merchandise; and he had a claim against the company for any injury while the merchandise was on the railway. Under the third system, disputes were much more frequent. The companies were bound by law to carry goods for all persons at certain tolls; but when they became road C. as well, they competed with the ordinary C. in a way which the latter could barely contend against. The Great Western railway has been unfavorably distinguished for jealousies and law-suits between the company and the carriers.

At the present time, the tendency is for the companies to take the responsibility of the whole conveyance, the C. acting as their agents, if willing so to do, or else endeavoring to maintain a fair competition. One of the greatest of the companies, the Midland, have in this way become C. on their own account, in order to obtain a share of the profit which accrues from road-traffic. The goods-vans traversing the streets of the metropolis, and other great towns, are now more frequently inscribed with the names of railway companies than with those of private carriers.

The goods-depots of the several railways are scenes of great activity during the night; for it is then that the arrival-trains are mostly unpacked, and the departure-trains mostly made up. During the day, vans are collecting goods from manufactories and warehouses; these goods are sorted at the depots, and are, when evening comes on, distributed among different trains, according to the part of the country to which they are to be conveyed. On the other hand, goods-trains arriving during the evening and night are unpacked, the goods classified according to districts, and sent out for delivery by road-vans on the following day.

The four-horse broad-wheel wagons, as already said, have almost disappeared from English roads; vans of lighter construction sufficing to convey merchandise from and to the various railway stations. Canals still command a trade, but it is chiefly in coal, stone, lime, ores, slate, bricks, and other articles very bulky in proportion to their value. The conveyance of manufactured goods has, for the most part, passed over to the railways.

Under C. are included carters and porters, who offer themselves for hire, to carry goods from one part of a city to another. Whether the same be the case with hackney-coachmen, is more doubtful; though, from the extent to which they are now employed in the transport of luggage, there seems no sound reason for an exemption in their case. Wharfingers and warehousemen are liable only under the special contracts into which they may have entered, or in accordance with mercantile usage. The introduction of the parcel post system (1883) has in some respects revolutionized the carrying trade in Great Britain.

CARRIERS, COMMON. In the U. S., common carriers are such as transport for hire for all persons indifferently. They operate both on land and water, and embrace stage-coach proprietors, railway and steamboat companies, truckmen, teamsters, express companies, etc., including owners and masters of every kind of vessel or water-craft who come before the public as the carriers of freight of any kind for whomsoever may choose to employ them, for either a long or a short voyage. Common C. are responsible for loss or damage during transportation from whatever cause, "except the acts of God, or of the public enemy." The act of God means only such inevitable accidents as occur without man's agency. The carrier is not responsible for losses occurring from natural causes, such as fermentation, evaporation, freezing, the ordinary decay of perishable articles, or the natural wear in the course of transportation, provided he exercises reasonable care to have such dangers as little as practicable. C. who undertake general business are bound to carry all matter that offers, under liability of legal action if they refuse without just excuse; but any carrier may restrict his business to certain goods, in which case he is not bound to accept things out of his line. A carrier may

require payment of freight in advance; and he is entitled to a lien upon the goods for his freight and for what he advances to other carriers. But all common-law responsibility may be qualified by special contracts. The bill of lading, or receipt for the goods, is an acknowledgment of the carrier's responsibility, and is presumed to name exceptions from responsibility if any there be. Railway companies, steamboat owners, and other C. who allow express companies to carry parcels and packages on their cars, boats, or other vehicles, are liable as common C. to the owners of the goods for loss or damage without regard to the contract between them and such express carriers. Railways, steamers, etc., carrying passengers, although not liable for injury to passengers without the C.'s fault, are responsible for the baggage of such passengers intrusted to them as common C., and the responsibility continues until the delivery of the baggage to the owner, or to his order. The baggage-check is the same as a bill of lading for goods, and is evidence of the responsibility assumed. Jewelry and a watch in a trunk are considered baggage, but money, beyond a reasonable amount for expenses, is not so considered. The responsibility of C. begins upon the delivery of the goods for immediate transportation. A delivery at the usual place of receiving freight, or to those employed by the company in the usual course of business, is sufficient. But where C. have a house at which they receive goods that are not to be forwarded until further order or a later time, such C. are in the mean time responsible only as depositaries; and where goods are received as by wharfingers, or warehousemen, or forwarders, and not as C., liabilities are incurred only for ordinary negligence. The responsibility of the carrier terminates when, after the arrival of the goods at their destination, a sufficient time has elapsed for the owner to receive them in business hours. After that the carrier may store them, and is responsible only for ordinary care. The agents of corporations which are common C., such as railway and steamboat companies, bind their principals to the full extent of the business intrusted to their control, whether they follow their instructions or not; nor will it excuse the company to show that the agents acted willfully in disregard of instructions. The carrier has an insurable interest in the goods both in regard to fire and marine disaster, except such as result from inevitable accident, such as fire by lightning-stroke. If a particular time is set for the delivery of goods, damages may be recovered for exceeding that time. The carrier is liable upon general principles where the goods are delivered through his default, to the extent of their value at the place of destination; and this includes the profits of the adventure. If the goods are only damaged, or not delivered in time, the owner is bound to receive them. He will be entitled to damages, but he cannot repudiate the goods and recover for the total loss.

CARRIERS OF PASSENGERS. (See **CARRIERS.**) Persons who carry passengers are not held responsible as insurers of the safety of their freight as carriers of goods are held. But they are held to the highest degree of watchfulness and care in all the conduct of their business. So far as human foresight and prudence can secure the passenger from harm, there is a right to demand it of all who assume the transportation of persons. It is a practice to print on passes or free tickets a notice that such a passenger assumes the risk of personal injury, but the courts have again and again decided that this in no degree lessens the carrier's liability, holding even that the transporting party was as much responsible for a non-paying as for a paying passenger. Passenger-carriers are responsible for the baggage of their passengers, and for the safety of parcels intrusted to them or their agents. Many decisions of American courts touch various points in the case of passengers, but all sustain the principle that if anything more could have been done by the carrier to insure the safety of his passengers, and injury occur in consequence of the omission, he is liable. Passenger-carriers are not responsible where the injury occurs through the negligence of the passenger; but when there is intentional wrong on the part of the carrier, the injured party may recover notwithstanding his negligence. And so also, where the carrier's negligence contributed only remotely to the injury and the passenger's culpable want of care was its immediate cause, a recovery may still be had. Passengers leaping from a conveyance in consequence of any just sense of peril may recover for injury. Carriers are bound to carry for the whole route for which they stipulate, and according to their public notices and the general customs of their business; but they are not bound to carry persons disorderly in conduct, or those having contagious diseases, or who are in any way dangerous or offensive to other passengers. The carrier is liable for damages if he fail to deliver the passenger in a reasonable time, or according to the published schedule. The sale of through tickets for a route operated by several successive companies of carriers having no partnership connection, renders each company liable for injuries to passengers occurring only in the part of the route which pertains to it severally. One decision in case of the death of a passenger was that the jury are to estimate damages for the death as they would for an injury to health, by the probable financial accumulations of the deceased had he survived, or not been injured through the culpable negligence of the carrier; therefore he or his estate is entitled to recover not only the damages sustained up to the time of trial, but all prospective damages likely to accrue from the injury. Passengers must conform to the rules of the road or company with regard to purchasing, showing, and giving up tickets, and in respect to trains and cars. But it has been held that when one purchased a ticket indorsed "good for this trip only," and was

unexpectedly detained, he could lawfully demand transportation by another train, even on the next day. Railway companies may exclude merchandise and articles known as "express" matter from the passenger cars. When an accident occurs to a train, or a stage-coach is overturned, the fact is considered *prima facie* evidence of fault on the part of the company or its agents. With regard to steam and other vessels, very strict rules are enacted by governments for the safety of passengers and property, regulating the number of passengers, the amount of provisions, the navigating of the ship, pilotage, etc.

CARRINGTON, HENRY BEEBEE,⁵ was born at Wallingford, Conn., in 1824. He was graduated at Yale college, in 1845, and later studied at the Yale college law school. He became professor in New Haven collegiate institute, and commenced the practice of law at Columbus, Ohio, in 1848. In 1857, while on the staff of Governor Chase, he helped to organize the state militia; and at the outbreak of the civil war he was made colonel of the 18th U. S. Infantry, and soon after, brigadier-general of volunteers. After the close of the war, he served in the west till 1868, and in 1869 he was made professor of military science in Wabash college, Indiana. He wrote *Absaraka, the Home of the Crows*, and a *History of the Battles of the American Revolution*.

CARRION CROW. See CROW, VULTURE.

CARRION FLOWERS, a name which, on account of their smell resembling that of putrid meat, has been given to the flowers of many species of *stapelia*. The genus *stapelia* belongs to the natural order *asclepiadeae*, and is remarkable for the excessive development of the cellular tissue of the stem and reduction of that of the leaves, resulting in a general aspect like that of the *cactus* family. The species are natives of the cape of Good Hope. The flowers are often large, and not devoid of beauty, but the carrion stench is very strong.

CARROLL, a co. in n. w. Arkansas, on the Missouri border, and King and White rivers; 659 sq. m.; pop. '90, 17,288, incl. colored. Surface varied and soil generally fertile. There are quarries of excellent yellow marble. Co. seat, Berryville.

CARROLL, a co. in w. Georgia, on the Alabama border, and the Chattahoochee and Tallapoosa rivers; 549 sq. m.; pop. '90, 22,301, incl. colored. The surface is mostly mountainous; but the soil is generally fertile, producing corn, wheat, cotton, etc. One or two gold-mines have been profitably worked. Co. seat, Carrollton.

CARROLL, a co. in n. w. Illinois, on the Mississippi river, and crossed by the Chicago, Milwaukee and St. Paul railroad; 440 sq. m.; pop. '90, 18,320. The surface is uneven, occupied by prairie and forest, and the main products are cereals, butter, and wool. Co. seat, Mt. Carroll.

CARROLL, a co. in n. w. Indiana, on the Wabash river, traversed by the Wabash and the Louisville, New Albany and Chicago railroads; 370 sq. m.; pop. '90, 20,021. It has a diversified and well-timbered surface, and productive soil, agriculture being the chief business. Co. seat, Delphi.

CARROLL, a co. in central Iowa on the Chicago and Northwestern railroad, drained by the North and Middle Raccoon rivers; 576 sq. m.; pop. '90, 18,828. The climate is good and the soil fertile. Co. seat, Carroll.

CARROLL, a co. in n. Kentucky, on the Ohio and Kentucky rivers, and Louisville and Nashville railroad; 165 sq. m.; pop. '90, 9266, incl. colored. It has a calcareous soil, with abundance of limestone. Productions chiefly agricultural. Co. seat, Carrollton.

CARROLL, a co. in n. Maryland, on the Pennsylvania border and the Patapsco and Monocacy rivers, reached by the Baltimore and Ohio, and crossed by the Western Maryland railroad; 426 sq. m.; pop. '90, 32,376, incl. colored. It has a hilly surface, and rather thin but well-cultivated soil; its productions are wheat, corn, butter, tobacco, etc. Co. seat, Westminster.

CARROLL, a co. in w. Mississippi, on the Yalabusha, Yazoo, and Big Black rivers, and crossed by the Southern railroad; 615 sq. m.; pop. '90, 18,773, incl. colored. The surface is level, and the soil is remarkably fertile; chief productions, corn and cotton. Co. seat, Carrollton.

CARROLL, a co. in n. w. Missouri, between the Missouri and Grand rivers, traversed by the Wabash, the Burlington Route, and the Atchison, Topeka, and Santa Fé railroads; 690 sq. m.; pop. '90, 25,742, incl. colored. It has an uneven surface, in many parts covered with black walnut and oak forests; its soil is generally productive. Chief business, agriculture. Co. seat, Carrollton.

CARROLL, a co. in n. e. New Hampshire, on the Maine border and Winipiseogee lake, reached by branches of the Boston and Maine railroad. The surface is mostly mountainous; productions chiefly agricultural. Area, 907 sq. m.; pop. '90, 18,124. Co. seat, Ossipee.

CARROLL, a co. in e. Ohio, traversed by the Tuscarawas branch of the Cleveland, Canton, and Southern, and the Pennsylvania Co.'s railroads; 401 sq. m.; pop. '90, 17,566.

It is hilly, but well-watered and fertile. Iron and coal are found. The chief productions are grain, hay, butter, and wool. Co. seat, Carrollton.

CARROLL, a co. in n. Tennessee, on the Big Sandy and Obion rivers, and the Louisville and Memphis, and the Nashville, Chattanooga, and St. Louis railroads; 600 sq. m.; pop. '90, 23,630, incl. colored. It is level and fertile, with forests of black walnut, hickory, maple, and oak. Chief productions, corn, wheat, cotton and butter. Co. seat, Huntington.

CARROLL, a co. in s.w. Virginia, on the North Carolina border, drained by the Kanawha river; 450 sq.m.; pop. '90, 15,497, incl. colored. The surface is rough, but well adapted to grazing. Copper, iron, and lead are found. The Grayson sulphur springs are much visited. Productions chiefly agricultural. Co. seat, Hillsville.

CARROLL, CHARLES, OF CARROLLTON, b. Md., Sept. 20, 1737; d. Nov. 14, 1832, aged 95 years; the last survivor of the fifty signers of the declaration of American independence. He was educated in the Jesuit colleges of St. Omer and Rheims; studied law at Bourges, Paris, and London, returning to America in 1764. He inherited the last and the largest of the old manorial estates of Maryland, a property estimated in 1775 at \$2,000,000, and he was then considered the wealthiest private citizen in the colonies. In 1775, he was chosen a member of the "committee of observation" at Annapolis, and in the same year sent to the provincial convention. In 1776, he was one of the commissioners sent to persuade the Canadians to join in the revolt against England. Returning to Maryland, he was prominent in bringing the colonial delegates to agree upon union for independence; and July 4, 1776, he was sent to congress, where, Aug. 2, he signed the declaration. At the time of signing, a delegate, alluding to Carroll's great wealth, remarked, "There goes a few millions; but there are many Charles Carrolls, and the British will not know which one it is;" whereupon Carroll immediately added after his name of *Carrollton*, an addition that was ever afterward respected. In congress, he was one of the board of war. About the close of 1776, he was one of the committee that drafted the Maryland constitution, and was chosen to the senate of that state. In 1777, he was again sent to congress, and in subsequent years was repeatedly elected to the state legislature. In 1789, he was United States senator; in 1799, one of the Maryland and Virginia boundary commission. July 4, 1821, but four of the signers of the declaration were living: Carroll, William Floyd of New York, and ex-presidents Adams and Jefferson. Floyd died in the next month, and Adams and Jefferson both died July 4, 1826, leaving Carroll the sole survivor. His last public act was the laying of the corner-stone of the Baltimore and Ohio railroad, July 4, 1828, when in his 90th year. Carroll's grand daughter, Miss Caton (d. 1853), was the Marchioness of Wellesley.

CARROLL, HENRY KING, LL.D., b. Dennisville, N. J., 1848; became an editor of *The Independent*, and agent in charge of religious statistics of the census of 1890; published *The Religious Forces of the United States* (1893), etc.

CARROLL, JOHN, D.D., LL.D. 1735-1815; cousin of Charles Carroll, of Carrollton; an American Roman Catholic prelate, educated in Europe, and for a time professor at Bruges. Returning to America, he was selected, with his cousin and Dr. Franklin, to go to Canada to urge the people to join the colonies in their effort for freedom. After the revolution, C. was appointed vicar-general, and in 1789, was promoted to bishop, being the first bishop of the Roman Catholic church in the United States. A short time before his death he was made archbishop.

CARROLL, JOHN LEE, b. Md., 1830; grandson of Charles Carroll, of Carrollton; educated at Georgetown coll., D. C., Emmetsburg, Md., and Harvard law school; was U. S. commissioner in New York, 1859; elected to Md. senate 1867; re-elected, 1871; gov. of Md., 1875, entering upon his duties on the 100th anniversary of the signing of the Declaration of Independence by his grandfather.

CARROLLTON, a city and co. seat of Greene co., Ill., 34 m. n.w. of Alton, on the Chicago and Alton and other roads. Its trade is in lumber, agricultural products and coal; pop. '90, 2258.

CARRON, a village in Stirlingshire, Scotland, on the right bank of the Carron Water, 3 m. n.e. of Falkirk. It is celebrated for its ironworks, which are among the largest of the kind in Britain. The works were established in 1760; and are carried on by a company, who employ a great number of men.

CARRONADES are short iron guns, invented by Mr. Gascoigne, and named after the Carron iron works in Scotland, where they were first made. They are lighter than ordinary guns, and have a chamber for powder, like mortars. They were made standard navy guns in 1779, to be carried on the poop, forecastle, and upper works. Being manageable by a smaller number of hands than guns, and being very useful in close engagements, they were held in much favor during the great war: the seamen called them "smashers." A 68-pounder carronade weighed not much more than half as much as the 42-pounder gun in use in 1779. They range from 68-pounders down to 6-pounders. The denominations, weights, lengths, caliber, etc., of the chief varieties of carronade are noticed under **ORDNANCE**.

CARBON GIL. See **BURNS**.

CARROT, *Daucus*, a genus of plants of the natural order *umbellifera*. They are mostly natives of the countries surrounding the Mediterranean sea. The common C. (*D. carota*) is a biennial plant, common in Britain and most parts of Europe, also in the Caucasus; and is universally cultivated not only in Europe and the European colonies, but in China, Cochin China, etc., for the sake of its root. The root of the wild plant is slender, woody, and of a very strong flavor; that of the cultivated variety is much thicker and more fleshy, much milder in its flavor and qualities, generally red, but sometimes orange or yellowish white. The sub-varieties in cultivation are also distinguished by their form—some being longer and more tapering than others—by their size, and by the duration of their growth; the *early* kinds being also comparatively small, and almost exclusively cultivated in gardens for culinary use, whilst the larger and *late* kinds are often also grown in fields, for feeding cattle. The field cultivation of the C. is carried on to a much greater extent in some parts of France, Germany, and Belgium, than in Britain; but it is increasing in Britain. The C. appears to have been cultivated at an early period in Flanders and Germany, and to have been introduced into the gardens of England in the beginning of the 16th century. In the reign of Charles I., ladies wore C. leaves as an ornament instead of feathers; and the beauty of the leaves is still occasionally acknowledged by placing a root, or the upper portion of one, in water, that it may throw out young leaves to adorn apartments in winter. The C. prefers a light and rather sandy soil, and often succeeds very well on a peat soil. It is very liable to the attacks of the larva of the crane fly (q.v.), by which the greater part of a crop is sometimes destroyed when the young roots are about the thickness of a quill; on which account, in gardens where there is particular reason to apprehend danger from this enemy, it is the practice to make a number of successive sowings, some of which may probably escape. As an article of food, C. contains a large amount of what are called heat-producing compounds, with a small proportion of flesh-forming matter. It consists essentially of starch, sugar, and albumen, along with a volatile oil, which communicates a flavor to many dyspeptics very unpleasant. The following is the composition of dried carrot:

Starch and sugar.....	93.71
Albumen.....	4.35
Red neutral substance (carotin).....	0.34
Fixed and volatile oils.....	1.00
Ash.....	0.60
	<hr/>
	100.00

C. is easy of digestion, and gently laxative. Boiled C. is used as a poultice for foul ulcers and other sores, and as a vermifuge. Grated C. forms an agreeable cooling but also stimulant application. A sirup is prepared from carrots; and when cut into small pieces and roasted, they are occasionally used in Germany as a substitute for coffee. A strong ardent spirit is distilled from them in some parts of Europe, 10 lbs. of carrots yielding about half a pint. C. seeds are employed as a diuretic, also as a carminative and stimulant; those of the wild C. being preferred.—Besides the crane fly, already noticed, carrots have numerous other insect enemies. One of the most troublesome is the carrot fly (*psila rosæ*), a small dipterous fly, the larvæ of which, by eating away the surface of the root, cause what is commonly known as *rust* in carrots, and prepare them for the further operations of millepedes and other destroyers. The larvæ of several species of moth (*depressaria*) are very injurious to them when in flower and seed.

CARROUSEL (Fr.), a species of knightly exercise, which, down even to the beginning of the 18th c., was very common in all the courts of Europe. C. was a kind of imitation of the tournament, and for a time after the discontinuance of the latter, seems to have supplied its place. The dresses, for the most part, were those of the knights of former times, and the combatants, or rather competitors, were divided into two parties, usually according to their different nationalities. One of the favorite exercises in France consisted in running at the pasteboard head of a Moor or Turk with a lance, cutting it down with a sword, or firing at it with a pistol. Another of these tests of skill and horsemanship, if not of courage, consisted in carrying off a whole line of rings, which were suspended for the purpose. The C. in France was not known earlier than the reign of Henry IV.; but it had existed for some little time previously in Italy. There were brilliant carrousels under Louis XIII., and two celebrated ones were given in honor of Mademoiselle de la Vallière—the one at Paris in 1662, the other at Versailles in 1664. The place where the first of these fêtes was held, has ever since been called the place du carrousel. A revival of the C. was attempted at Berlin in 1750; and in 1828 the cavalry school at Saumur held one in honor of Madame la Duchesse de Berry. The so-called Eglinton tournament—an entertainment given some years ago by the chivalrous earl of Eglinton—was in reality a carrousel. In the U. S. this name is applied to a “merry-go-round,” or movable platform fitted with wooden horses on which children ride.

CARSE is a term applied in Scotland to low lands adjoining rivers. The word is of uncertain origin. In Stirlingshire, it is restricted in its sense to the level alluvial soils which are only a few feet above the river Forth. In Perthshire, it also applies to the whole of the slightly undulating lands to the n. of the Tay, which form the C. of Gow-

rie. C. soils usually consist of argillaceous deposits, which produce crops of great luxuriance, although there are some which consist of hungry and barren clays. The richest of them are of a hazel color, and become friable when exposed to the action of frost; the poorest, on the other hand, are of a yellow color, containing little vegetable matter to render them amenable to cultivation. The best kinds of C. soils are generally farmed on the six-course shift—1. Grass; 2. Oats; 3. Beans; 4. Wheat; 5. Potatoes; 6. Turnips or fallow. Large crops of grass are grown when the clover-plant catches. It is mostly made into hay, and the after-math is used for soiling horses and cattle in the straw-yards. The land is seldom pastured, as the feet of animals trample and destroy the grasses, when the weather is wet. The oat-crop is more uncertain on the carses, but in favorable years, the yield is large, and the quality of the grain is excellent. Beans are very successfully grown, indeed the best of the C. soils are the best bean-soils in Scotland. Where the land is rich, and not too stiff, the potato is sometimes largely grown. On the poorest description of the C. soils, the potato does not thrive. Wheat can be grown in closer succession on the C. lands, than on any other description of land with the same expenditure of manure. A large stud of horses are required on C. lands, to enable the farmers to prepare the land for the various crops, at the moment when the season suits. A small portion of the land is still usually summer-fallowed.

CARSON, a co. in Texas "Panhandle," formed 1876; drained by the n. fork of Red river: 900 sq. m. Pop. '90, 356. Co. seat, Panhandle.

CARSON, ALEXANDER, LL.D., 1776-1844; an Independent or Congregational preacher of the n. of Ireland, officiating at Tubbermore for 30 years, within which time he became a Baptist and published *Baptism, its Mode and Subjects*.

CARSON, CHRISTOPHER, or "Kit Carson," b. Ky., 1809, d. Col., 1868; one of the most famous pioneers and scouts of the west. When about 24 years old he was appointed hunter to Bent's Fort, where he remained eight years; he was then engaged as a pioneer in Fremont's explorations among the Rocky Mountains. In 1847, he was made lieutenant in a rifle corps of the regular army. In 1853 he drove 6,500 sheep over the plains and mountains to California. He was afterward Indian agent in New Mexico, and was instrumental in making a number of treaties of importance. In the civil war he did good service on the borders, and was brevetted brig-gen. The remarkable adventures of "Kit Carson" often surpass the most extravagant romance, though the most daring of them are literally true. Personally he was as modest as he was brave.

CARSON CITY, a city, capital of Nevada, and co. seat of Ormsby co., 4 m. from Carson river, 178 m. n.e. of San Francisco, on the Virginia and Truckee railroad. It is in a picturesque region near the base of the Sierra Nevada, and only about 10 m. from lake Tahoe. There is a branch mint in Carson City which receives immense deposits of silver and gold ore. There are a state-house, several churches and schools, and many mining and manufacturing establishments. Pop. '90, 3950. The state prison is 2 m. n.e. of the city.

CARSON RIVER, a stream in Nevada, rising in the Sierra Nevada, passing n. near Carson City and Lyon, and emptying into Carson lake, a body of water about 15 miles long, that appears to have no outlet.

CARSTAIRS, WILLIAM, a distinguished political and ecclesiastical character of the 17th c., who took a very active part in bringing about the revolution of 1688, was b. at Cathcart, near Glasgow, Feb. 11, 1649. He was educated at the village school of Ormiston, in East Lothian, and subsequently at the university of Edinburgh, where he displayed a remarkable aptitude for learning. In his 24th year, Scotland being then in a most unsatisfactory state, alike from a political and religious point of view, C. went to study theology at Utrecht. His scholarship, polite address, knowledge of men, and great political information, especially regarding his own country, recommended him to the notice of the prince of Orange, who chose him as his confidential adviser in all matters relating to Britain. In 1682, being in England on a mission of observation from Holland, he was employed to negotiate between the English and Scotch conspirators in the Rye House plot. With others implicated, he was arrested and put to the torture of the thumbscrew, but refused to confess anything that had not been previously revealed, and that only on condition that what he said should not be used in evidence, either directly or indirectly, against any other person. At this time, he had secrets from Holland of the greatest importance in his possession, which he carefully concealed, although there can be no doubt that their revelation would not only have saved him from torture, but have obtained for him great reward and honor. Britain, therefore, owes very much indeed to the firmness of C. at this juncture. He returned to Holland about the beginning of 1685; and, acting mainly on his advice, the prince of Orange planned and carried out the invasion of 1688. He accompanied the prince as chaplain, and after the settlement of the crown, when the prince had been firmly established as William III., C. was instrumental in effecting a reconciliation between him and the Scottish church, when the ill advice of other councilors had nearly led to an open rupture. From 1693 to the death of the king in 1702, he could not have had more influence in Scottish affairs if he had been prime-minister of the country; and his authority in church matters was such, that he was popularly called "cardinal Carstairs." He was elected principal of the university of Edinburgh in 1704, and in this capacity used all his influence with

government to obtain an increase of patronage for the Scottish colleges. In the same year he was presented to the church of Greyfriars, and was appointed moderator of the general assembly next succeeding, an office to which he was four times elected in the course of eleven years. He died Dec. 28, 1715, deeply regretted by the whole nation, and leaving a reputation for scholarship and sincere piety, as well as for unbounded charity and political sagacity rarely equaled. See *Life of C.*, by Rev. Dr. Story (1874).

CARSTENS, ASMUS JACOB, an eminent German artist, was b. near Schleswig, May 10, 1754. In 1762, he went to Copenhagen, where, when first introduced to the royal gallery of paintings and casts from the antique, he was so excited that he shed tears of joy. After staying seven years in the Danish capital, where he produced his "Baldur's Death," and "Eolus and Ulysses," supporting himself chiefly by portrait-painting, he commenced a journey on foot to Rome, but was obliged to return for want of means after reaching Mantua. He resided in Lubeck for some time, but through the kindness of a wealthy amateur artist named Rodde, he contrived to reach Berlin, where his great composition, the "Fall of the Angels" (with 200 figures), gained for him an appointment as professor in the academy, while his decoration of a saloon in the Dorville palace obtained for him an introduction to the king and a pension. He was now enabled to visit Rome, where he devoted himself to the study of the works of Michael Angelo and Raphael. His first work in Rome, a "Visit of the Argonauts to the Centaur Chiron," was distinguished by purity of style, beauty of forms, and fine distribution of light. His numerous subsequent drawings mostly represented scenes from the ancient classic poets, with subjects from Ossian, Dante, and Shakespeare. C. died May 26, 1798.

CART, a species of carriage with two wheels, in which respect it differs from the ordinary wagon that has four wheels. There are different kinds of carts, according to the nature of the goods or articles to be carried, and they also differ considerably in different countries. The C. is little seen in England, where the heavy and more capacious wagon takes its place. It is, however, used for agricultural and other purposes in Cumberland and adjoining northern countries. There, it differs only in a slight degree from the C. universally used in Scotland. The Scotch C. is an exceedingly convenient form of carriage for general merchandise, or for agricultural produce, and well adapted for being drawn on roads in a hilly country. A material advantage consists in its weight, being about only half a ton, while its usual load is from a ton to 22 cwt.; from which circumstance it is a particularly handy vehicle for comparatively light loads, and so far is superior to the English wagon, which is best adapted to carry huge loads of from two to three tons. In carrying hay, straw, or grain from the harvest-field, Scotch farmers employ a peculiar kind of C. without sides to admit of a bulky load; but they also, as occasion serves, use for a similar purpose an ordinary C., on which they place a movable frame. All grain for market is carried in the one-horse C., and a driver takes charge of two carts. The following advantages of one-horse carts are well enumerated by lord R. Seymour: "A horse, when he acts singly, will do half as much more work as when he acts in conjunction with another; that is to say, that two horses will, separately, do as much work as three conjunctively. This arises, in the first place, from the single horse being so near the load he draws; and in the next place, from the point or line of draught being so much below his breast, it being usual to make the wheels of single-horse carts low. A horse harnessed singly has nothing but his load to contend with; whereas, when he draws in conjunction with another, he is generally embarrassed by some difference of rate, the horse behind or before him moving quicker or slower than himself; he is likewise frequently inconvenienced by the greater or less height of his neighbor: these considerations give a decided advantage to the single-horse cart. The very great ease with which a low C. is filled may be added; as a man may load it, with the help of a long-handled shovel or fork, by means of his hands only; whereas, in order to fill a higher C., not only the man's back, but his arms and whole person must be exerted." To these just observations it need only be added that in many parts of England there is a wasted expenditure in horse-power, a pair of horses being often set to draw a clumsy wagon to market, containing a load which could with the greatest ease be drawn by one horse in a less ponderous machine.

The one-horse C. is employed by carriers all over Scotland, the load being usually piled high in a square form, and covered in with a woolen wrapper, in which state the C. is drawn 18 to 20 miles a day. See **CARRIERS**. In France and Germany, the carrier's C. is a more gigantic machine. Long in the body, very strong in construction, and poised on two high wheels with broad rims, this continental C. carries enormous loads, almost equal to what are seen in the large wagons of England. The ingenious manner in which the load is adjusted to rest exclusively on the wheels, and so relieve the single horse in the shafts, is matter of surprise to all strangers. All carts, whatsoever, in Great Britain, must bear the name and address of the owner, painted conspicuously on them, according to statute 1 and 2 Will. IV. c. 22. See **WAGON**.

CARTAGENA, a fortified seaport of Spain, on a bay of the Mediterranean, in lat 37° 36' n., long. 0° 57' w. It is built partly on the declivity of a hill, and partly on a plain extending down to the sea, and is inclosed by hills which screen it from all winds. The harbor is one of the best in the Mediterranean, capacious enough to hold the largest

fleets. The entrance is narrow, and completely commanded by the fortifications on an island called La Isoletta, on the south. It was formally the largest naval arsenal not only in Spain but in Europe. The city, which is surrounded by walls, has a Moorish aspect; its streets, cathedral, and the ruins of an old castle being of that architecture. C. has manufactures of sail-cloth and glass, besides extensive blast-furnaces and smelting-works, and a trade in barilla, agricultural produce, and esparto grass. The tunny fishery is important, and its ancient silver and lead mines, recently re-opened, are again productive, as are the zinc and iron mines. Pop. of town and suburbs, 1887, 84,171. C., which was a colony of the Carthaginians, was built by Hasdrubal 242 B.C., under the name of New Carthage. It formed the headquarters of the Carthaginians in Spain, and soon became a city of much wealth and influence. It was captured by P. Scipio, in 210 B.C., and became of importance under the Romans, who are said to have employed 40,000 men daily in the mines in the neighborhood.

CARTAGENA, in Colombia. See **CARTHAGENA**.

CARTE, THOMAS, an English historian, distinguished for his industry and research, was b. at Clifton, in Warwickshire, where his father was parish minister, in 1686. Educated at Oxford, he afterwards took the degree of M.A. at Cambridge, and entering holy orders, was appointed reader at the Abbey church, Bath; but being attached to the Stuarts, he resigned his office rather than take the oaths to the new government. In 1722, he was suspected of having been concerned in the conspiracy of bishop Atterbury, whose secretary he was, and £1000 was offered for his apprehension; but he escaped to France, where he remained for some years. On his return to England, he published a life of the duke of Ormond, remarkable for the fullness of its information. In 1747-55, he published a *History of England*, bringing it down to the year 1654. This work is very valuable for its facts, but the author had not the capacity to grapple with these philosophically. Hume and other historians, however, have been much indebted to him for the materials of history. Among his other works was an edition of Thuanus; and at his death, in 1754, he left behind him 20 folio and 15 quarto volumes of MSS., in further illustration of the history of England to 1688, which have proved of great utility to subsequent writers. These are preserved in the Bodleian library, Oxford.

CARTE BLANCHE (Fr. *carte*, paper *blanc*, *blanche*, white), a blank paper authenticated with an authoritative signature and intrusted to some one to be filled up as he may think best. Thus, in 1649, Charles II. tried to save his father's life by sending from the Hague to the Parliament a signed *carte blanche* to be filled up with any terms which they would accept as the price of his safety. By a metaphorical application, the term has come to denote unlimited authority, freedom to do as one wills.

CARTEL, during a time of war, is an agreement between the belligerents for an exchange of prisoners. Sometimes the name is given to a ship, called by the French a *bâtiment parlementaire*, commissioned to convey the exchanged prisoners, or to carry messages to the enemy.

CARTEL, THE. See **POLITICAL PARTIES**, GERMAN.

CARTER, a co. in n.e. Kentucky, on Little Sandy river; 544 sq. m.; pop. '90, 17,204. Co. seat, Grayson.

CARTER, a co. in s.e. Missouri, on Current river; 500 sq. m.; pop. '90, 5799. Co. seat, Van Buren.

CARTER, a co. in n.e. Tennessee, on the North Carolina border, in the highest part of the state, watered by the Wautauga, Doe, and affluents of Holston rivers; 298 sq. m.; pop. '90, 13,389, with colored. East Tennessee and Western North Carolina, and the Bristol, Elizabethton, and North Carolina railroads traverse the county. Co. seat, Elizabethton.

CARTER, FRANKLIN, PH.D., LL.D., American educator, was born in Waterbury, Ct., in 1837. After preparing for college at Phillips Academy, Andover, Mass., he studied at Yale and Williams, graduating at the latter in 1862. After a course of study at the University of Berlin, he returned to America; from 1865 to 1868 was professor of Latin and French at Williams College, and from 1868 to 1872 was professor of Latin alone. In 1872 he was called to Yale, where he was professor of German until 1881, and during that period he studied theology and was licensed to preach. In 1881 he was chosen President of Williams College, in that year receiving the degree of LL.D., from Union College. He has published an edition of *Iphigénie auf Tauris* (1879), and has contributed articles to the *New Englander*, the *Transactions of the American Philological Society*, and the *Transactions of the Modern Language Association of America* (of which latter society he was the first president), and to other journals. Under his presidency Williams College has made rapid and solid progress in the acquisition of material resources and in the expansion of courses of instruction.

CARTERET, a co. in e. North Carolina, on Pamlico sound and the Atlantic ocean, traversed by the Atlantic and North Carolina railroad; 510 sq. m.; pop. '90, 10,825, with colored. Much of the surface is occupied by swamps and pine forests. Productions mainly agricultural. Co. seat, Beaufort.

CARTERET, JOHN, EARL GRANVILLE, a distinguished orator and statesman of the 18th c., was b. April, 1690, his father being baron Carteret of Hawnes, Bedfordshire. His education, commenced at Westminster school, was completed at Oxford. From the latter

place, according to Dean Swift's humorous assertion, he carried away more Greek, Latin, and philosophy than was at all becoming a person of such high rank. Introduced into the house of peers in 1711, he spoke in favor of the Protestant succession, and in consequence received the early notice of George I., and obtained some lucrative appointments. In 1718-19, he was appointed ambassador extraordinary to Sweden, and in the following year succeeded in concluding a peace between Sweden, Prussia, and Hanover. In 1721, he was appointed secretary of state, and in this capacity defended with great zeal the proceedings of government in the Atterbury conspiracy. In 1724, he was made lord lieutenant of Ireland. During his vice-regency, he was in constant intercourse, and held frequent discussion, with Dean Swift about public affairs. His lord lieutenancy, which lasted from 1724 to 1726, and again from 1729 to 1730, was popular, particularly the latter period. From 1730 to 1742, he was one of the most able and determined of the leaders of the opposition in the house of lords against sir Robert Walpole, and on his displacement, was made a secretary of state. On the death of his mother, in 1744, he succeeded to the title of earl Granville, and in the same year had to resign his seals of office, the Broad-bottom Administration (q.v.) expressly excluding him; but he continued to receive marks of the royal favor. C. was a most liberal patron of men of letters. He died Jan., 1763.

CARTESIAN PHILOSOPHY. See DESCARTES.

CARTHAGE, city and co. seat of Jasper co., Mo., in the lead regions, on the line of the Missouri Pacific and the St. Louis and San Francisco roads, 220 m. s.w. of Jefferson City. On July 5, 1861, a force of confederates under Gen. Jackson and Gen. Price, consisting of about 3500 men, while retreating from the main army of Gen. Lyon, were, at a point about 7 m. e. of Carthage, confronted by Gen. Sigel with about 1500 union troops. Gen. Sigel, being superior in artillery, gave battle, which continued several hours with much loss to the confederates, when, to prevent the confederate cavalry from outflanking him and to protect his baggage train, Gen. Sigel fell back in good order, and continued his retreat to Carthage and Sarcoxie, 15 miles to the east. C. has zinc mines, stone and lime works, foundries, flour mills, manufactories of plows, carriages, etc., banks, newspapers, a court-house, public library, and several parks. The water-power is obtained from Spring river, $\frac{1}{2}$ m. n. of the city. Pop. '90, 7891.

CARTHAGE, called *Carthāgo* by the Romans, *Carchēdon* by the Greeks, both of which are but forms of the native name *Karth-hadtha*, i.e., "New Town" (found on ancient coins), was the greatest city of antiquity on the n. coast of Africa, and was situated in what now constitutes the state of Tunis, on a peninsula extending into a small bay of the Mediterranean sea. It was founded, according to legend, by Dido (q.v.), a Phœnician queen, who had fled from Tyre after the murder of her husband, almost nine centuries before the Christian era, but more probably (like the Anglo-Indian Calcutta) it originated in an emporium or *factory* established by the colonial merchants of Utica, and the capitalists of the mother-city Tyre, on account of the convenience of its situation. Unfortunately, we know very little of its growth. Our information only begins after C. had become one of the greatest commercial cities of the world, and we have but very scanty and one-sided accounts of it even then. The number of the inhabitants before its destruction amounted to about 700,000. The population was partly of Phœnician, partly of Libyan descent. The territory which the Carthaginians acquired by the subjugation of the Libyan tribes, and by the ultimate annexation of other older Phœnician colonies, with which they had at first been simply in alliance, such as Utica, Hadrumetum, Tunis, Hippo, the two Leptæ, etc., extended in the middle of the 5th c. B.C. southward to lake Triton, eastward to the Great Syrtis, and westward to Hipporegius (now Bona). The maritime power of the Carthaginians enabled them also to extend their settlements and conquests to the other coasts of the Mediterranean. In the 6th c. B.C., they were masters of Sardinia, and had begun to contend for the possession of Sicily. Hanno (q.v.) founded colonies on the w. coast of Africa beyond the straits of Gibraltar, and Himilco visited the coasts of Spain and Gaul. The relations of C. to foreign states in earlier times are not very clear. The first treaty with the Romans was concluded in 509 B.C.; the second, in 348 B.C.; the third, in 306 B.C. The connected history of C. begins with the 5th c. B.C., a period of wars between the Carthaginians and the Greeks in Sicily. The Carthaginian army under Hamilcar was destroyed by Gelon at Himera in 480 B.C. It was not till 410 B.C. that the war began which ended in the conquest by the Carthaginians of some parts of the island. Dionysius the elder, or rather the pestilence working for him, put a stop to their conquests, but did not succeed in expelling them. War raged almost constantly between Dionysius and the Carthaginians. The more feeble reign of Dionysius the younger afforded them an opportunity of extending their conquests, yet they were frequently repelled and defeated by the Sicilian Greeks; and during 311-301 B.C., Agathocles carried the war into Africa, and attacked C. itself. After his death, the Carthaginians again increased their dominions in Sicily, and although Pyrrhus contended successfully against them at first, he left that island entirely in 275 B.C. The subjugation of the s. of Italy by the Romans, brought the two great and conquering nations into collision, and the first Punic war arose, 264 B.C., and after

a great naval victory of the Romans, terminated in 241, the Carthaginians giving up Sicily, Sardinia, and Corsica, and paying to the Romans a large sum of money. Soon after this, a mutiny of the hired troops of C., combined with an insurrection of the Libyan tribes, the ancient inhabitants of the country, who were kept down by the arbitrary rule of the Carthaginian colonists, threatened the entire ruin of the city. Hamilcar brought that bloody war, however, to a successful termination, and led an army to Spain, where he, and after him Hasdrubal, obtained great successes. Here was founded New C., now Cartagena (q.v.). After Hasdrubal's death, 221 B.C., Hannibal (q.v.), burning to revenge the defeat which his native city had sustained from the Romans, broke the treaty with them, and took Saguntum, 219 B.C. Thus began the second Punic war, in which Hannibal pursued his career of conquest from Spain, through Gaul, and across the Alps into Italy itself, defeated the Romans with terrible slaughter in various battles, and, by that of Cannæ in particular, brought Rome to the very brink of ruin. Yet the war terminated in the total defeat of the Carthaginians by Publius Cornelius Scipio, who overthrew their power in Spain, and was victorious over Hannibal in the final and decisive battle of Zama, in Africa, in Oct., 202. A peace was then concluded, in which the Carthaginians were limited to their African territories; but most of their ships of war and war-elephants were taken from them, besides an immense sum of money, and they were taken bound not to make war without permission of the Romans. Massinissa, king of Numidia, skillfully availed himself of dissensions which arose within C. between the nobles and the people, to advance his own interests at the expense of the Carthaginians; and as they (151 B.C.) opposed him, and drove his adherents out of the city, the Romans seized the opportunity for a new declaration of war, 149 B.C., on the ground that the treaty was broken; and after a siege of two years, C. was taken by Publius Cornelius Scipio Æmilianus, 146 B.C. For six days the combat was maintained in the streets of the city, and for seventeen days the work of its destruction by fire was carried on by the conquerors. The country became a Roman province. C. Gracchus sent out 6,000 colonists to found a new city on the site of Carthage. It was called Junonia, but it did not prosper. Augustus, carrying out the intention of his great uncle, restored the city, and the new C. had become, in the second and third centuries of the Christian era, one of the finest cities of the Roman empire. In 439 A.D., Genseric made it the capital of the Vandal kingdom; Belisarius conquered it in 533, and named it Justiniana; the Arabs under Hassan utterly destroyed it in 647 A.D.; and now only two or three small hamlets and a few ruins mark its site.

We have not very satisfactory accounts of the constitution of the Carthaginian state. It is certain that it was oligarchical, and that the chief power was in the hands of the great families (*gentes*), from whose members the senate, amounting to 300, was chosen. This senate appointed, as it were, a more select council of 30, and sometimes a still smaller one of only 10, at the head of whom were two *suffetes* (probably the same as the Hebrew *shofetim*, "judges"), but it is not certain what relation these bore to one another, or how their power was apportioned between them. We can gather dimly, from various scattered statements, that the Carthaginian oligarchy, while despising the multitude, was itself split up into factions, and torn by family jealousies. Corruption largely prevailed; and it would perhaps have been better for the country if the power had been in the hands of a popular despot than of a band of insolent and tyrannical nobles.

The Carthaginian army was raised from the conscription of the subjugated Libyans, from the hired Numidians, and from slaves. In the time of Agathocles, the city sent forth 40,000 heavy armed infantry, 1,000 cavalry, and 2,000 war-chariots, but the state could easily raise 100,000 troops. The fleet in the first Punic war consisted of 350 ships, carrying 150,000 men. How C. contrived to raise revenues sufficient to cover the enormous expense her military and naval organization involved, is not very clear. It was, in all likelihood, derived from tribute imposed on subject Libyan or Numidian races, in great part from mines in Spain, and from import duties derived from her maritime and inland trade, which was prodigiously great. Her merchantmen visited every coast and island of the Mediterranean, and even ventured as far as the Azores, Britain, the Baltic, etc.; while her caravans penetrated through Sahara to the gold-producing districts of the Niger, and through the Libyan desert to the lands along the Nile.

The religion of the Carthaginians appears to have been substantially the same as that of the Phenicians—a worship of the stars and of fire. Moloch was the chief deity, and to him children and captives were sacrificed. The highest natural manifestation of this deity was the sun. Besides Moloch, the Carthaginians worshiped the Tyrian Hercules; Astarte, the goddess of the elements; Esmun, the god of the celestial vault; and a variety of heros, heroines, and genii or spirits, such as the Genius of Death, Hamilcar (who fell at the battle of Himera), Dido, the brothers Philæni, etc., as well as a few of the lesser Greek divinities, of whom a knowledge had been obtained in Sicily. It does not appear that there was a distinct sacerdotal order in Carthage. Probably religious ceremonies were performed by the dignitaries of the state, but our knowledge on this interesting point is too meager to permit of our arriving at any very definite conclusion. See A. Church, *Carthage, or the Empire of Africa* (1886).

CARTHAGE, CAPE, a headland of n. Africa, jutting into the Mediterranean, in lat. 36° 52' n., lon. 10° 22' east. Traces of the ancient city of Carthage (q.v.) are found on it to the n. of the Tunis lagoon.

CARTHAGENA, or **CARTAGENA**, a fortified seaport and capital of the state of Bolivar, United States of Columbia, stands on a sandy island a little to the southwest of the mouth of the Magdalena river, and is connected by bridges with its suburb Jetsemani, on the mainland. Founded by the Spaniards in 1533, Carthagena was in 1585 sacked by the English under Sir Francis Drake, and in 1741 was besieged by the fleet of Admiral Vernon. Its walls and defences were completed in 1717 at a cost of \$59,000,000. In 1815 it was reduced by the royalist Gen. Morillo, but in 1821 it was freed from Spanish rule. The temperature ranges from 80° to 86° F., but the climate is salubrious, although Carthagena has been ravaged at intervals by yellow fever. The harbor is the best on the coast, and the main entrance, Boco Chica, is defended by two strong castles. The exports, which consist of cotton, sugar, hides, tobacco, coffee, and other articles, are sent chiefly to Germany, Great Britain, and the United States. A canal connects Carthagena with Calamar on the Magdalena. The city is well built and has a cathedral, a university, a naval arsenal, a city hall, hospitals, and other public buildings. Pop. 1887, 12,000; estimated in 1895 at 20,000.

CARTHAGENA BARK. See **CINCHONA**.

CARTHA'GO, a term of various application in Central America.—1. An almost landlocked bay or lagoon of the Caribbean sea, near the n.w. extremity of the Mosquito shore.—2. A river entering the same from the s.s.w., about lat. 15° n., and long. 84° west.—3. A river of Costa Rica, flowing into the gulf of Nicoya, an inlet of the Pacific, near lat. 9° 36' n., and long. 84° 30' w.—4. A city, or rather the ruins of one, on the same, about 60 m. from its mouth. Down to 1841, it was the capital of Costa Rica; but being in that year all but destroyed by an earthquake, it was supplanted by San José, previously its superior in wealth and importance, about 15 m. to the w.n.w. of itself. The volcano of its own name, doubtless connected with its overthrow, is valuable as a landmark to mariners.

CARTHA'GO NOVA. See **CARTAGENA**.

CARTHAMINE, or **CARTHAMEINE**. The dye so called is obtained by a chemical process from safflower (q.v.), (*carthamus tinctorius*) in crystals which are insoluble in water, but slightly soluble in alcohol and ether. When newly precipitated, C. immediately and permanently attaches itself to cotton or silk, but not to wool, requiring no mordant, dyeing the fabric a fine red, which is changed to yellow on the addition of alkalies, and may be returned to red again on being treated with acids.

CARTHUSIANS, a monastic order which owes its origin to St. Bruno, who retired in 1086 with six companions to the solitude of La Chartreuse (whence the name), near Grenoble, where they built hermitages, wore rude garments, and lived upon vegetables and coarse bread. In 1134, the fifth prior, Guigo, composed a body of rules, called the *Statuta Guigonis* or *Consuetudines Cartusie*, but they have been often changed. After 1170, when the order received papal approbation, it extended rapidly. It dates from 1180 in England, where the name of Chartreuse-houses was corrupted into charter-houses. The C. were divided into two classes, fathers (*patres*) and brothers (*conversi*). Each occupied a separate cell, with a bed of straw, a pillow, a woolen coverlet, and the means of manual labor or of writing. They left their cell, even for meals, only on festivals and on days of the funeral of a brother of the order. Thrice a week, they fasted on bread, water, and salt, and there were several lengthened fasts in the year. Flesh was forbidden at all times, and wine, unless mixed with water. Unbroken silence, except on rare occasions, was enforced, as well as frequent prayer and night-watching. These austerities were continued, with little modification, by the modern Carthusians. The order at one time counted 16 provinces, and can still boast some of the most magnificent convents in the world—as *La Grande Chartreuse*, near Grenoble, and *Certosa*, near Pavia. They were given to hospitality and works of charity, and were on the whole better educated than the mendicant orders. Their principal seats were in Italy, France, and Switzerland; but they have shared the fate of the other monastic establishments, and their convents are now for the most part solitudes indeed. The Carthusian nuns arose at Salette, on the Rhone, in France, about 1229. They followed the rules of the Carthusian monks, but with some mitigations, of which the most notable is that they have a common refectory. See *ILLUS.*, *PRIESTS, MONKS, AND NUNS*, vol. XII.

CARTIER, Sir GEORGE ÉTIENNE, 1814-73; a lawyer of Canada, educated at St. Sulpice, Montreal. He was one of the Papineau "rebels" in the abortive revolution of 1837-38, but was forgiven; and became a member of the provincial legislature, secretary, and attorney-general. In 1858, he became premier. He was instrumental in abolishing feudal tenure in Lower Canada, in making the legislative council elective, in codifying the laws, in decentralizing the judiciary, and in bringing about the confederation of the colonies. There is a monument to him in Ottawa.

CARTIER, JACQUES, b. 1494, in Brittany. In 1534 he sailed from St. Malo in command of two ships to explore the n.e. coast of America. He touched at Cape Buenavista, Newfoundland, passed up the straits of Belle Isle and discovered the mainland of Canada, which he claimed for France. The next year, with another expedition, he sailed up the St. Lawrence as far as Hochelaga, a large fortified native village at the foot of a

hill, which he named Mont Royal (now Montreal). Disgusted with the severe climate, and his men being sick with scurvy, he went back to France in 1536, and nothing was done towards colonization until 1540, when Jean Francis de la Roche, sieur de Roberval, obtained leave to form a settlement. In 1541, Cartier was sent out in command of five ships, and near the present Quebec he built a fort and named it Charlesbourg; but the Indians, whose chief he had carried off in his previous voyage, gave him so much trouble that he returned to France. Cartier appears no more in public life except as seigneur of his native village of Limoilin, where he was living as late as 1552.

CARTILAGE is a firm elastic substance, of a pearly whiteness, presenting to an unaided eye a uniform and homogeneous appearance. Cartilages may be divided into the *temporary*, the *permanent*, and the *accidental*. The *temporary* cartilages are substitutes for bone in the earlier periods of life, and after a certain time become ossified. See **OSTEOLOGY**. At birth the extremities and larger eminences of the long bones, and the margins of the flat bones are still cartilaginous, and this C. does not altogether disappear till the period of puberty. The *permanent* cartilages are either *articular* or *non-articular*. *Articular* cartilages are attached to the extremities of bones, and enter into the formations of joints. *Non-articular* cartilages are usually more flexible than the articular. They are sometimes attached to bones, to lengthen them out, as, for instance, in the nose, the auditory canal, and the Eustachian tube. See **EAR**. In other cases they form the basis of distinct organs, as the larynx, the trachea, and the eyelids. *Accidental* cartilages are cartilaginous concretions, which are occasionally found in situations where they do not normally occur, and are of no general interest. The physical properties of cartilages, especially their elasticity, resisting power, and incapability of extension, are such as to fit them admirably for the functions which they have to perform in the animal economy. A brief notice of the microscopical characters of C. will be found in the article **CELLS**, and a reference to its chemical composition will be found in the articles **GELATINOUS TISSUES** and **GLUTEN**.

CARTILAGINOUS FISHES are those fishes which have a skeleton destitute of bony fibers. In some of these fishes, the skeleton is merely rudimentary, so that they seem to form an intermediate link between vertebrate and invertebrate animals. In the lancelets (q.v.), (*amphioxus*), it consists of nothing more than a slender, transparent, flexible dorsal column; in *myxine* also it is a soft flexible tube, without appearance of vertebræ or of ribs; in the lampreys, the dorsal column is still a mere cylinder of cartilage, without any notable division into segments; whilst even in the sturgeon, the center of the backbone is a continuous gelatinous cord, and in the sharks the vertebræ are formed of hollow cones, meeting at their apexes in the middle, and having their cups filled with the remains of the gelatinous cord, an arrangement from which result great elasticity and flexibility. In many instances, even in the higher C. F., several vertebræ are united in a single piece; in all of them the skull is formed of a single piece without sutures, although the general form agrees with that of the skull of other fishes, and the same parts or regions may be recognized. The calcareous matter present in the skeleton is always deposited in a granular manner, giving a characteristic dotted appearance; but even in the skull of the basking shark, one of the most highly organized, the earthy matter has been found to form little more than 3 per cent of the whole substance; in the skeleton of the lamprey, it is only $1\frac{1}{2}$ per cent. In other parts of their organization, C. F. differ from each other very widely; some of them possessing the organs of the senses in as great perfection as any fishes whatever, whilst in others these organs are very imperfectly developed. Linnæus placed the C. F. along with batrachian reptiles in his class *amphibia*. By the general consent of naturalists, however, they are placed in the class of fishes. Cuvier, referring to the very different degrees of organization which they exhibit, says "they form a series ranging parallel to the bony fishes just as the marsupial mammalia range parallel with the other ordinary mammalia." Owen and others, admitting the justice of this view, have, however, pointed out in the C. F. generally, characters corresponding with those of the osseous fishes in their embryotic state, and with the permanent or mature conditions which prevailed among the fishes of some of the older geological periods. One remarkable characteristic even of the higher groups of C. F.—sturgeons, sharks, rays, etc.—is the *heteroercal* tail, the vertebral column being prolonged into the upper portion of the caudal fin, and the lower one given off on its under side, as in the fossil fishes generally of the old red sandstone and other oldest fish-producing rocks. Cuvier divided C. F., or *chondropterygii* (Gr. cartilage-finned) into 3 orders: *sturiones* (sturgeon, chimera, etc.), having the gills free, and gill-openings with a lid, like the osseous fishes; *selachii* (sharks and rays), having the gills fixed, and consisting of folds of membrane on a plane surface, with numerous gill-openings, the jaws movable as in other fishes generally; and *cyclostomi* (lampreys, etc.), also having fixed gills and numerous gill-openings, the mouth adapted for sucking. Müller and Owen, however, separate the *cyclostomi* of Cuvier from the other C. F., on account of important anatomical differences, particularly in the structure of the heart, which in the *cyclostomi* wants the *bulbus arteriosus*, or thick muscular swelling of the commencement of the arterial system close to the ventricle; whilst this, which may, in fact, be considered as a third chamber of the heart, is present in the *sturiones* and *selachii*, and within it, are 3 or more longitudinal rows of valves; characters derived from the vascular system being

deemed by these great naturalists of the highest value in determining the arrangement of the class of fishes. The lancelets occupy a place by themselves, from their absolutely wanting a heart, and having the circulation carried on by the muscularity of the entire vascular system.

CARTOON (Ital. *cartone*, pasteboard; from Lat. *charta*, paper). In the fine arts, C. is a design on strong paper, of the full size of a work to be afterwards executed either in fresco, oil color, or tapestry. The object of the artist in preparing a C. is, that he may adjust the drawing and composition of his subject in circumstances in which alterations can be effected with facility, before proceeding to the execution of the work itself. Cartoons are generally composed of a number of sheets of stout paper or pasteboard, pasted together at the edges, and stretched on a frame. The surface is sometimes *primed*, or washed with a ground-color; but more frequently this process is dispensed with. The drawing is made either in chalks or in *distemper* (q.v.), in which latter case the C. itself has very much the appearance of a fresco. Frequently only two colors are used, merely for the purpose of producing light and shade, in which case the C. is said to be in *chiaro-oscuro*. The C., when finished, is transferred to the canvas or plaster on which the work is to be executed, either by tracing with a hard point, or by pricking with pins, charcoal in both cases being used. Sometimes lines are simply drawn across it, or, if it is wished to preserve it from injury, threads are stretched across it from pins placed at the required distances along the edges. In *fresco* painting (q.v.), the plaster on which the work is executed must be kept wet, in order that it may absorb the color, and consequently only a small portion can be executed at a time. For this reason, the C. must be traced in small compartments of the size that the artist can finish without stopping. It is here, consequently, above all, that the necessity for the previous execution of a C. is greatest, as it would be impossible to sketch the whole design on the plaster in the first instance. But the great masters used such studies in *chiaro-oscuro* as guides to them in almost all their more extensive works, and many of these monuments of their care, as well as of their genius, have been preserved. We have cartoons of Andrea Mantegna, Domenichino, the Caracci, etc.; but the finest specimens of cartoons in existence are those of Raphael at Hampton court. These marvelous conceptions were sent to Flanders in the reign of Leo X., in order that they might be copied in tapestry in two sets, one of which was designed for the pope, the other for a present by the pope to Henry VIII. of England. The tapestries, which are very inferior to the designs, are still in existence. One set is in Rome, the other was in England till the death of Charles I., when it was purchased by the Spanish ambassador and carried to Spain. At a recent period it was brought to London and offered for sale, but as no English purchaser was found, it was again carried to the continent. For many years the cartoons, originally twenty-five in number, lay neglected at Brussels, and many of them were destroyed. The seven now at Hampton Court were at length purchased by Rubens for King Charles I. It is an instance of Cromwell's good sense, in a direction in which it was not often exhibited, that at the dispersion of the royal collections, these cartoons were purchased for the nation by his special command. So low was the artistical taste of the time, however, that whilst the "Triumph of Julius Cæsar," by Andrea Mantegna, still at Hampton court, was valued at £2,000, the cartoons of Raphael were set down at £300! In Charles II.'s time, these remarkable works were again consigned to oblivion. An attempt was made to have them copied in tapestry, by which they were seriously injured. William III., strangely enough, followed in Cromwell's footsteps in appreciating what Charles II. had neglected. He had the cartoons restored, and built a gallery for them at Hampton Court, where, with the exception of a visit to Windsor in George III.'s time, they have since sojourned. The following are the subjects represented: 1. Paul Preaching at Athens; 2. The Death of Ananias; 3. Elymas, the Sorcerer, struck with Blindness; 4. Christ Delivering the Keys to Peter; 5. The Sacrifice at Lystra; 6. The Apostles Healing the Sick at the "Beautiful Gate" of the Temple; 7. The Miraculous Draught of Fishes. Our space and our design equally preclude us from attempting any statement of the merits of these exquisite compositions. Several of the lost cartoons are partially transmitted to us by engravings, some of which were executed from the tapestries; others, it is believed, from the originals. The subjects of these are—1. The Adoration of the Kings; 2. Christ appearing to Mary Magdalene; 3. The Disciples at Emmaus; 4. The Murder of the Innocents; 5. The Ascension. These were engraved, along with the others, by Somereau, a French engraver, in 4to. Other cartoons of Raphael exist—one the property of the duke of Buccleuch, and two in the possession of the king of Italy, which are said to have belonged to the set sent to Flanders. There is also a portion of one in the national gallery in London, but it is now painted over with oil color. The best engravings of the cartoons at Hampton Court are by Dorigny, Audran, and Holloway. The name cartoon is also applied to full-page sketches in journals and other publications; perhaps most often to illustrations of a comic nature such as those in *Punch* and *Harper's Weekly*, the most famous cartoons in the latter periodical having been those of Thomas Nast (q.v.). See **CARICATURE**.

CARTOUCH is a word much used in the French military service, but less frequently in the English. The name was once given to a wooden case containing 200 to 300 musket-bullets, and 8 or 10 1-lb. balls, fired from a mortar or howitzer in defense of a

ditch or intrenchment; but such missiles have been superseded by others. The cartridge-box carried by the soldiers used to be called a C. in England, and still is in France.

CARTOUCHE, the name by which the French, and we after them, designate the ovals on which the hieroglyphic characters for the names of Egyptian kings are sculptured. See CAVO-RELIEVO. C. is also used to signify a tablet, either for ornament or to receive an inscription, sq formed as to resemble a sheet of paper or parchment, with the edges and ends rolled up. Cartouches are often seen on tombs. The same term is sometimes applied to modillions, or brackets supporting a cornice.

CARTOUCHE, LOUIS DOMINIQUE, 1693-1721; the leader of a band of robbers and assassins in France, whose crimes created great terror in Paris. For many years he eluded the police, but at last was arrested by chance in a low drinking-house. He had a long trial, which created a great deal of interest, and was finally sentenced to death, and broken on the wheel before an immense assembly of approving spectators.

CARTRIDGE is a cylindrical case made to contain either the whole or a part of the materials for discharging from a fire-arm. Those for ordnance or large guns are chiefly made of serge and flannel, sewn up into the form of a bag, which, supplied with a given weight of powder, is tied round the neck, and strengthened by iron hoops. The weight of powder varies from about 300 lbs. for an 81-ton gun, to a few ounces for a mountain gun.

Cartridges for small-arms which load at the muzzle are usually paper tubes, containing a leaden ball and a few drachms of powder. The tubes are made in such a way that the powder has two or three thicknesses of paper around it, while at the mouth of the tube and over the bullet there is only one. The paper over the bullet is lubricated generally with a composition of beeswax and tallow. In loading, the paper at the mouth of the tube has to be twisted or bitten off; the powder is then poured into the barrel, the tube reversed, and the bullet inserted into the muzzle, and the tube broken away. Cartridges for breech-loading small-arms are generally formed of a thin sheet of brass coiled into a cylinder, and having an iron case, in the center of which is the percussion arrangement. Those used for the Snider and the Martini-Henry rifles are described in the article on BREECH-LOADING ARMS. Besides the C. case of coiled brass, there are others made of solid brass or copper (an American invention), and these seem to be gaining favor abroad, the Prussians having adopted such a case for the new Mauser rifle.

For muzzle-loading shot guns, the chief cartridges used contain a charge of shot packed in a paper cylinder of a size suitable for the bore of the gun. Some of these, in addition to the paper covering, are surrounded with a wire net-work, for the purpose of increasing the range and penetration.

The C. for breech-loading shot guns is usually a stout cylinder of paper with a metal case. They are made of various sizes to suit the different calibers of guns, and with pin or central fire ignition. In the pin-fire C., a small brass pin passes through the side of the case into the percussion cap, and protrudes through a small hole in the top of the barrels. The pin is struck by the hammer of the gun, and forced into the percussion cap, which explodes, and ignites the powder. In the central-fire C., the cap is in the center of the case, and is exploded by the hammer of the gun acting on a piston contained in the false breech.

In America, a solid brass C. case is often used for shot guns.

For sporting rifles, the cartridges are quite as numerous and as varied as for shot guns. With large-bore rifles the same C. case is generally used as for shot guns, but loaded with powder and ball (spherical, solid conical, hollow conical, or shell). For small-bore, or what are known as express rifles, either a coiled brass C. case, similar in construction to that for the Snider or Martini-Henry rifle, but made to contain a larger charge, or a solid brass case is used. The coiled case can be reloaded twice or thrice, while the solid case can be reloaded as often as twenty times, and on this account the latter is rapidly gaining favor with sportsmen in India and Africa. The express C. contains a very heavy charge of powder, with a light hollow conical bullet giving very great velocity, low trajectory, and immense killing power. In the Henry express C., the charge of powder is 4 drachms, while the bullet weighs only 270 grains.

Cartridges for breech-loading pistols and revolvers are generally small metal cylinders containing a charge of powder and a bullet. See illus., CANNON, vol. III., figs. 41, 53, 55, 58, 59; also see illus., GUNS, vol. VII.

CARTRIDGE-PAPER, a light-colored strong paper, originally manufactured for soldiers' cartridges (q.v.), is extensively used in art, its rough surface being useful for certain kinds of drawing; name also given to a line of wall papers.

CARTWRIGHT, EDMUND, celebrated on account of his invention of the power-loom, was b. April 24, 1743, at Marnham, Nottinghamshire. Educated at Oxford, he obtained a living in the English church, and devoted himself exclusively to his ministerial duties and to literature, until a casual conversation, in 1784, directed his attention to machinery, and in 1785 he exhibited his first power-loom (q.v.) in action, an ingenious though very rude machine; upon which, however, he subsequently effected improvements rendering it almost perfect. Its introduction was vehemently opposed, and a mill fitted up with

500 of his looms was ignorantly and maliciously burned down. C., in 1790, took out a patent for combing wool, and secured patents for various other improvements in connection with manufactures. But his patents yielded him little return, and, in 1809, government, in consideration of his inventions, granted him £10,000. C. was the author of a legendary poem, entitled *Arminia and Elvira*, and other poetical pieces. He died Oct., 1823. His daughter published a *Life* (London, 1843).

CARTWRIGHT, JOHN, 1740-1824; usually called maj. C.; in the English navy in his youth. He was present at the capture of Cherbourg, and subsequently on the Newfoundland station, when he was appointed chief magistrate of the settlement, discharging the duties of the office with great ability for five years. When the dispute with the American colonies began, he espoused their cause, declining to fight against them, and thereby rejecting an almost certain high military or naval promotion. In 1774, he published *American Independence the Glory and Interest of Great Britain*. The next year he was appointed maj. in the Nottingham militia, which position he served for 17 years, being finally superseded because of his political opinions. In 1776, he appeared in print as the advocate of parliamentary reform, and thenceforth devoted his life to the attainment of universal suffrage and annual parliaments. In 1778, he was an unsuccessful candidate for Nottinghamshire, and the same year founded the "society for constitutional information," a body which embraced many of the distinguished men of the day, and from which organization rose the famous "corresponding society." His work in the furtherance of reform was incessant. In 1819, he was indicted for conspiracy, found guilty the following year, and sentenced to pay a fine of £100. He spent his last years in London. He was married, but left no children. In 1831, a monument to him was erected on Burton Crescent.

CARTWRIGHT, PETER, D.D., 1785-1872; a native of Virginia; settled in early life in Kentucky, where, in 1806, he was ordained a deacon in the Methodist Episcopal church. He was subsequently regular preacher and presiding elder, and a member of every quadrennial conference from 1816 to 1860, and once more in 1868. He was a zealous worker, in the course of 33 years preaching about 15,000 sermons, and baptizing 12,000 converts. C. was widely known for his homely but powerful preaching; and interesting stories are told of his daring and romantic adventures among the rough back-woodsmen. Many of these can be found in his *Fifty Years a Presiding Elder*, and in the *Autobiography of Peter Cartwright, the Backwoods Preacher* (New York, 1856).

CARTWRIGHT, Sir RICHARD JOHN, Canadian statesman, was born at Kingston, Ontario, Canada, Dec. 4, 1835. He was educated at Trinity College, Dublin, and on his return to Canada studied law, but relinquished its practice in order to engage in banking. Having made a very careful study of financial questions he entered public life as a Conservative member of the Legislative Assembly in 1863. In 1870 he joined the Liberal party and held the portfolio of Finance in the Mackenzie ministry from 1873 to 1878. On retiring from office in the last named year, he was made Knight Commander of the Order of Michael and George. As leader of the Liberal party he took an active share in the election of 1891, and aided greatly in cutting down the Conservative majority in the House of Commons. He was the first Canadian statesman of importance to consider the subject of annexation to the United States as a practical question in Canadian politics.

CARTWRIGHT, SAMUEL ADOLPHUS, b. Va., 1793; d. May 2, 1863. He studied medicine under Dr. Rush, and graduated at Pennsylvania college. During Jackson's campaigns against the Indians and the British he was surgeon-in-chief, and, after 1815, settled in Alabama, and afterward in Natchez, Miss., where he labored for a quarter of a century. Dr. C. wrote many valuable papers upon fevers, cholera, and other diseases.

CA'BUS, KARL GUST., a German scholar, physiologist, physician, and artist, was b. at Leipsic, 3d Jan., 1789. He first attracted notice by a series of lectures on comparative anatomy, delivered in his native city about the year 1812. After having superintended, during the war of 1813, the French hospital at Pfaffendorf, he went to Dresden, where he was appointed professor of midwifery in the newly organized medico-chirurgical academy, but resigned his office when elected court physician and counselor of state. His house was the rendezvous of all the most distinguished savants and artists in Dresden. C. wrote a vast variety of works, some of which are marked by original and striking views, as, for instance, *Ueber den Kreislauf des Blutes der Insecten*, in which he demonstrates the circulation of the blood in insects. He died in July, 1869.

CA'BUS, MARCUS AURELIUS, 222-83; Emperor of Rome; supposed to have been the son of a noble Roman lady and an African father. On the assassination of Probus in 282, C. was proclaimed emperor by the legions. He was victorious over the Sarmatians, and in a winter campaign in Asia, he carried his arms beyond the Tigris. He died very suddenly in camp, and it was given out that he had been struck with lightning.

CARVAHAL', or CARBAJAL, TOMAS JOSÉ GONZALES, 1753-1834; poet and statesman of Spain; educated at Seville. He held a number of offices of importance, and in 1812, became director of the university of San Isidore, where, by establishing a chair of international law he offended the government, and was imprisoned for 5 years. He was reinstated by the revolution of 1820, but forced into exile by the counter-revolution 3 years later. He died a member of the supreme council of war. C. obtained celebrity as the author

of metrical translations of the poetical books of the Bible, and for other works in prose and verse.

CARVALHO E MELLO. See POMBAL.

CARVEL-BUILT. The difference between the *carvel* and the *clinker* methods of arranging the outer planks in ship and boat building is explained under **CLINKER-BUILT**.

CARVER, a co. in s.e. Minnesota, on the Minnesota and Crow rivers; 340 sq.m.; pop. 790, 16,532. Surface undulating, and soil fertile; productions, agricultural. The Minneapolis and St. Louis and the Chicago, Milwaukee, and St. Paul railroads traverse it. Co. seat, Chaska.

CARVER, JOHN, b. England, about 1575; d. in Mass. 1621. He left England on account of religious intolerance, and settled in Leyden, whence he was sent to effect certain arrangements with the Virginia company. In 1619 he got a patent, and sailed in the *Mayflower* with 101 colonists. On the landing at Plymouth, Carver was chosen as governor, and managed affairs prudently for the four months between his election and his death.

CARVER, JONATHAN, 1732-80; a native of Connecticut; began the study of medicine, but became a soldier, and served in the colonial wars previous to the revolution. After the peace of 1763, and the cession of the Canadas to Great Britain, Carver traveled extensively in the northwestern wilderness, for the purpose of finding new openings for trade, going to England to announce his discoveries. In 1778, he published *Travels through the Interior Parts of North America*, and the next year a treatise on the culture of tobacco. He died in extreme destitution.

CARVING, a subordinate branch of sculpture, is usually performed on ivory or wood. Ivory was the favorite material for this purpose in the e. from an early period. Among the Babylonians, who likewise practiced gem-engraving to a great extent, carved heads for staves were executed in vast quantities, as every Babylonian carried a staff and a signet ring. During the palmy days of Grecian art, ivory was largely employed; the nude portion of the colossal statues of the gods being composed of some solid material overlaid with plates of ivory, while the remaining portions were of plate gold. At a later period, ivory was chiefly employed in small works, usually of a decorative character. During the earliest period, statues of the gods were generally of wood, painted, gilt, or draped with colored robes, different kinds of wood being appropriated to different divinities. Carvings in ivory form an important branch of early Christian sculpture. Among the most curious of these are the ivory tablets adorned on the outside with low-reliefs, and in the inside coated with wax for the purpose of writing upon. The chair inlaid with ivory that belonged to archbishop Maximilian in the cathedral at Ravenna, is of this period (546-55). In the year 803, Charlemagne received two richly carved doors as a present from Constantinople, but works of the same kind were executed at a much earlier period. Towards the end of the middle ages, the art of C. in wood was brought to a high degree of perfection in Germany. Altars were adorned with carvings of this material, often of large size, and with numerous figures; in general, the nude portions were carefully and tastefully colored after nature, and the draperies gilt. Specimens are to be seen in the churches at Altenberg, Erfurt, Prague, and in some churches in Pomerania. The finest and most perfect specimens are a series of reliefs relating to the doctrine of transubstantiation in the church at Tribsees. Many of the Belgian churches also possess very beautiful examples of wood-carving. Michael Wohlgemuth of Nuremberg, and after him Veit Stoss, were eminent carvers in wood. The wood-carving on the great altar of the cathedral at Schleswig by Hans Bruggemann belongs to the beginning of the 16th century. Many graceful specimens of wood-carving, on a smaller scale, belonging to this period, are to be seen in museums. Nuremberg was celebrated for its wood-carvings; but only a few of the many works ascribed to him can be assigned with certainty to Albert Dürer. Portrait medallions, usually cut in box, were much in vogue during the early part of the 16th century. The first artist in this line was Hans Schwartz of Augsburg. During the 17th and 18th centuries, we find ivory again extensively employed in crucifixes, crosses, and goblets, with relief representations. The most eminent artist is Franz de Quesnoy.

CARY, ALICE, b. near Cincinnati, O., 1820, d. N. Y., 1871. At the age of 18, she began to write for the press, and at the age of 30, with the assistance of her sister Phœbe, she published a volume of verses which were exceptionally popular. In 1851, the sisters removed to New York city, where, under the friendship and patronage of Horace Greeley, they led successful literary and social lives for 20 years. Among the works of Alice, besides many poems, are *Clovermook*; *Hagar, a Story of To-Day*; *Marrried, not Mated*; *Pictures of Country Life*; *Snow Berries*; *The Bishop's Son*; *The Lover's Diary*, etc.

CARY, ANNIE LOUISE, b. Wayne, Me., 1842; began her career as an operatic contralto in Europe, 1867; sang in the principal cities of the United States, 1870; made a second prolonged tour of Europe, 1875-7, and sang in the United States till 1882, when she married Charles M. Raymond, and retired from public life.

CARY, ARCHIBALD, 1730-86; a Virginian, conspicuous on the patriot side of the revolution, his services being mainly in the Virginia convention and house of burgesses.

When the state government was organized he was chosen president of the senate. The story is told of him that, on hearing a report that Patrick Henry was spoken of for dictator, he said to Henry's half-brother, "I am told that your brother wishes to be dictator. Tell him from me that the day of his appointment shall be the day of his death, for he shall find my dagger in his heart before the sunset of that day." Patrick Henry was the last man in the world to aspire to a dictatorship.

CARY, Rev. HENRY FRANCIS, known for his admirable translation of Dante, was b. at Gibraltar, in 1772. At Oxford, where he entered Christ Church as a commoner in 1790, he was early distinguished as a classical scholar, and also for his knowledge of Italian, French, and English literature. In 1805, he translated Dante's *Inferno*, and in 1814, the whole of the *Divina Commedia*, a translation remarkable not only for its accuracy but for its expressiveness and force. He afterwards translated Pindar's *Odes* and Aristophanes's *Birds*, and wrote a series of memoirs, in continuation of Dr. Johnson's *Lives of the Poets*. For some years he held the appointment of assistant-librarian in the British museum, and died in 1844. A memoir by his son was published in 1847.

CARY, LOTT, b. a slave in Virginia in 1780, d. in Monrovia, Africa, 1828. Early in life he became a zealous Baptist; redeemed himself and two children from slavery, and in 1821 went to Liberia, where he was concerned in removing the colonists from the unhealthy locality first chosen for their settlement. He did much to advance the welfare of the new republic, and was left in full power when, in 1828, Mr. Ashmun sailed for the United States.

CARY, PHOEBE, 1824-71; sister of Alice, also a poetical and prose writer. Most of her works were issued with those of Alice. She d. at Newport, R. I., three months after the death of her sister, with whom she was a life-long companion. Neither of them was ever married. See Mary Clemmer Ames's *Alice and Phœbe Cary* (1873).

CARY, Sir ROBERT, son of Henry Cary, lord Hunsdon, was b. in 1559 or 1560, and rose to eminence in the civil service of queen Elizabeth. For a number of years he acted as English warden of the marches. As a courtier, he was present at the death of Elizabeth, 1603, and expeditiously rode on horseback to Edinburgh to communicate the intelligence to her successor, James VI. At the coronation of Charles I., he was elevated to the peerage as earl of Monmouth. At his death without male issue the earldom became extinct. Sir Robert Cary wrote his *Memoirs* (Edin. 1808), a work interesting chiefly from notices connected with border history. He d. in 1639.

CARYA. See HICKORY.

CARYATIDES (pl. of *Caryatis*, literally, a woman of Caryæ, a name given to female figures, in Greek architecture, when applied instead of columns to support a roof. The traditional account of the origin of the name is, that the inhabitants of Caryæ, a city in Arcadia, having joined the Persians after the battle of Thermopylæ, the Greeks, after their victory over the Persians, destroyed the town, slew the men, and carried the women into captivity. As male figures representing Persians were used for this purpose, it occurred to Praxiteles, and other Athenian artists, that female Caryatæ, in their national costume, might be thus employed to commemorate the disgrace of their country. Lessing, and various other writers, have treated this account as fabulous; but it seems to be confirmed by a bas-relief preserved at Naples, in which two female figures are represented in the attitude of C., and which has a Greek inscription mentioning the conquest of Caryæ. Male figures used for the same purpose are called Atlantes (q.v.).

CAR'YL, JOSEPH, 1602-73; a non-conformist clergyman, a native of London, educated at Oxford. By order of Cromwell, he attended Charles I. in Holmby house, and in 1650, he was sent with Owen to accompany Cromwell to Scotland. He is remembered for a ponderous commentary on the book of Job, in which, after the fashion of his time, he enlarges on every verse, and almost on every word.

CARYO'CAR, a genus of large trees of the natural order *rhizobolaceæ*, and almost constituting the whole order. They are all natives of Guiana and Brazil, and are sometimes called *pekea* trees. They yield good timber for ship-building, and produce the delicious nuts, now not uncommon in the London market, called *butter nuts* or *souari nuts*. The fruit is a sort of drupe, containing several combined nuts. The fleshy part of the drupe consists of a butter-like substance, which melts between the fingers, and is used in cookery instead of butter, on which account these trees are sometimes called *butter-trees*. It forms merely a thin covering for the nuts, the bristles on the outer surface of which, in some of the species, sting like the hairs of the nettle, and are very troublesome to those who open them. The kernels are remarkably soft. An oil is extracted from them which is scarcely inferior to olive oil. *C. nuciferum* is now cultivated in the island of St. Vincent; but *C. butyrosom*, *C. glabrum*, *C. tomentosum*, and other species appear equally worthy of attention.

CARYOPHYLLA'CEÆ, a natural order of exogenous plants, containing upwards of 1000 known species, mostly herbaceous plants, a few half shrubby. The stems are tumid at the articulations; the leaves always opposite and entire, often uniting around the stem. The flowers are regular; the calyx persistent, of 4 to 5 sepals, either free or united into a tube; the corolla of 4 to 5 petals, which are frequently bifid, and generally terminate

in a claw at the base, sometimes wanting; the stamens as many, or twice as many, as the petals; the ovary of 2 to 5 carpels; the stigmas sessile; the fruit is a one-celled capsule, with central placenta, to which the seeds are attached.—The plants of this order are mostly natives of temperate and cold countries; some of them are only found on tropical mountains, near the limits of perpetual snow. Most of them are inconspicuous weeds; some produce beautiful flowers; almost all are insipid and inert; a few contain *saponine*, and afford a substitute for soap. See SOAPWORT. To this order belong the pink, carnation, sweet William, lychnis, chickweed, etc.

CARYOPHYLLUS. See CLOVES, MYRTACEÆ.

CARYOP'SIS, in botany, a fruit in which the seed and pericarp are so incorporated as to be inseparable, and even undistinguishable. The grain or fruit of grasses, as wheat, barley, rye, maize, etc., is a caryopsis.

CARYOTA, a genus of palms, natives of the East Indies, one of which, *C. urens*, remarkable for the acidity of its fruit, which produces a burning sensation when its pulp is applied to the skin, is also highly valuable for the great quantity of juice (*toddy*) which flows from its wounded spathes, sometimes, in the hot season, to the amount of 100 pints in 24 hours from a single tree. Sugar (*jaggery*) is made from this juice by boiling it down, and on this account this palm is sometimes called the jaggery palm. The pith of old trees, or farinaceous part of the trunk, is also much used for food, and is said to be equal to the best sago. The outer part of the stem is very hard, and applicable to many purposes. The fibers of the leaf-stalks are made into ropes, which are very strong and durable; the leaf-stalks, merely stripped of the leaflets, are used as fishing-rods, being light, tapering, and elastic; and the woolly substance found at their base is sometimes used for calking ships. This palm is found both in India and Ceylon, and abounds chiefly in mountainous districts. It rises to a height of 60 ft., with a trunk of a foot in diameter, and a magnificent spreading head of great double pinnate leaves, and triangular leaflets, the apex of the triangle being their point of attachment.

CARYSFORT REEF, off the s.e. coast of Florida, in 25° 13' n., and 80° 13' west. There is a light 106 feet above tide. Navigation is dangerous on account of the proximity of the gulf stream.

CASA, the prefix to many names in Italian and Spanish, signifying "house" or "home."

CASABIAN/CA, LOUIS, 1755–98; b. at Bastia; an officer in the French navy, and at a later period a member of the national convention; later still one of the council of 500; and finally capt. of *L'Orient*, flag-ship of the fleet that transported Bonaparte and his army to Egypt. In the battle of Aboukir, when the fleet was attacked by the English, Casabianca fought to the last; and, with his son 10 years old, was killed in the blowing up of the vessel.

CASACALEN'DA, a t. of Italy, in the province of Campobasso, 17 m. n.e. of Campobasso, on the site of the ancient Calela. Fruits and wine of good quality are produced in the district, where silk-worms are also reared. Pop. 6000.

CASA'LE, a city of n. Italy, province of Alessandria, situated on the right bank of the Po, which is here crossed by an iron bridge, 38 m. e.n.e. of Turin. It is a place of considerable antiquity, and occupies the site of a more ancient town. Many Roman remains are found, and coins of the early ages of the republic. It has a cathedral, dating from the 8th c., with valuable archives. The old citadel, founded in 1590, was one of the strongest in Italy, and within recent years the fortifications have been greatly strengthened and extended. During the Italian campaign of 1859, C. was occupied by divisions of the Sardinian army, and for a short time formed the head-quarters of the French emperor. It has manufactures of silk-twist, and a trade in the produce of the district, which is very fertile. Pop. about 27,000. C. formerly gave its name to a province which had an area of about 350 sq. m., and a population of about 143,000.

CASAL'-MAGGIO'RE, a t. of n. Italy, province of Cremona, on the left bank of the Po, 22 m. e.s.e. of Cremona. Being subject to frequent inundations from the river, strong embankments have been constructed for its protection. It has manufactures of earthenware, leather, glass, etc. Pop. of commune, 16,000.

CASAMAS'SIMA, a t. of Italy, in the province of Bari, 14 m. s.e. of the city of that name. It has a convent and two abbeys, and the vicinity produces wine and almonds. Pop. 7,600.

CASANO'VA, FRANCIS, a celebrated painter of battles and landscapes, was b. in London, of Venetian parents, 1732. Educated in Italy, he afterwards went to Paris, from which he was driven by the severe criticism of Diderot. C. then took up his abode in Dresden, where he painted chiefly battle-pieces, and by one of his greatest works gained a place in the academy. He afterwards went to Vienna, and painted for the empress Catharine her victory over the Turks. He died in Briel, near Vienna, 1805. The execution, and especially the coloring of his works, are excellent.

CASANOVA DE SEINGALT, GIOVANNI JACOPO, a notable adventurer of the Cagliostro species, was b., 1725, in Venice, and studied in Padua, afterwards in Venice, intending to enter the church. Having been expelled for sufficient reasons from a seminary of priests, he traveled to Naples, visited Rome, and after many adventures arrived in Constantinople. On his return to Venice in 1745, he supported himself for a time by his skill as a violinist, until he gained some celebrity by curing a senator who had been attacked by apoplexy. His irregularities again drove him from Venice. He now wandered about for some time among the chief cities in the n. of Italy, Milan, Mantua, Verona, Ferrara, Bologna, Parma, etc., but in 1750 he proceeded to Paris, where he was patronized by the nobility, and became acquainted with several eminent authors. It is needless to mention in detail his endless, inexplicable peregrinations. He visited almost every European capital, was somehow introduced to the best company, invariably excited the disgust or ill-will of those who knew him, and had always to "vanish" after a brief period of enjoyment. In 1761, we find him distinctly professing the miraculous after the Cagliostro fashion: he having undertaken to regenerate old Madame D'Urfé into a young man—for a consideration! He died in Bohemia in 1798. His celebrated memoirs, *Mémoires écrites par Lui-même* (12 vols., Leip. 1826-38), contain many interesting notices of the manners of his times, intermixed with details of his personal adventures.

CASAREEP, or **CASSIRIPE**, a sauce or condiment made from the juice of the bitter cassava or manioc root. It is in the highest esteem in Guiana, where it is employed to flavor almost every dish; and it is the basis of the favorite West Indian dish called *pepper-pot*. It is a powerful antiseptic, and meat can by means of it be kept for a long time quite fresh, even in a tropical climate. It is made by evaporating and concentrating the juice, which is also mixed with various aromatics. The poisonous principle of the juice is dissipated in the evaporation, so that although the juice in a fresh state is readily fatal to life, the C. is perfectly safe and wholesome. C. is imported into Holland and Britain, and remains unimpaired in quality for several years.

CASAS GRANDES (the "great houses"), a t. in Chihuahua, Mexico, 150 m. n.w. of the city of Chihuahua, celebrated for the ruins of early Mexican buildings still to be seen. These ruined houses are built of sun-dried bricks of mud and gravel, each brick about 22 in. thick and 3 ft. in length. The walls, which are in some places 5 ft. thick, seem to have been plastered both outside and inside. The main edifice, about 800 by 200 ft. in extent, is rectangular, and appears to have consisted of three separate piles united by galleries or lines of lower buildings, and the ruins indicate a height for the main staircase of six or seven stories. In the same vicinity are artificial mounds from which have been excavated stone axes, corn-grinders, and various other utensils. Similar ruins are found near the Gila, the Salinas, and the Colorado rivers.

CASATI, GAETANO, b. Italy, 1838; was in the Piedmontese army 1859-79; went to Africa under the Italian society for commercial exploration, 1879; explored the basin of the Bahr-el-Ghazal; joined Emin Pasha, 1883; was captured by Kabrega, 1886, and released by Stanley, 1889; and besides reports published *Dieci Anni in Equatoria* (1891).

CASAUBON, ISAAC DE, a great scholar and critic, was b. Feb. 18, 1559, at Geneva, where, in 1582, he was appointed professor of the Greek language. Subsequently he held professorships at Montpellier, 1596, and at Paris, 1598, but the death of Henry IV. rendered his position (C. being a Protestant) very insecure, and he therefore gladly accepted the offer of sir Henry Wotton to visit England. King James received him with distinction, and appointed him some time after prebendary of Canterbury and Westminster. He died in London, July 1, 1614. His acute investigation and criticism were applied to several branches of archæology and theology. Among his chief works may be mentioned the able dissertation, *De Satirica Græcorum Poësi et Romanorum Satira* (1605); the treatise *De Libertate Ecclesiastica* (1607); and the *Exercitationes contra Baronium* (1614), a confutation of cardinal Baronius. His critical and exegetical works include editions of Diogenes Laërtius, Aristotle, Theophrastus, Suetonius, Persius, Polybius, Theocritus, Strabo, etc.—See *Isaac Casaubon*, by Mark Pattison (1875).

His son, **MERIC CASAUBON**, was b. at Geneva, 14th Aug., 1599; educated first at Sedan, he accompanied his father to England, and entered Christ Church college, Oxford, where he took his degree of M.A. in 1621. He was appointed rector of Ickham, near Canterbury, 1628, and afterwards professor of theology at Oxford. He died at Oxford, July 14, 1671. His attachment to Charles I. deprived him of all his preferments during the commonwealth, but at the restoration he received them again. Meric was, like his father, distinguished for his erudition; edited the works of Marcus Aurelius Antoninus, Terence, Epictetus, etc.; and wrote a treatise, *De Enthusiasmo* (Lond. 1655).

CAS'BIN, or **KAZVIN**, a t. of Persia, in the province of Irak-Ajemi, 90 m. w.n.w. of Teheran. It is situated on an extensive plain of the same name, and is inclosed by walls. Before the time of Shah Abbas the great, C. was for a brief period the capital of Persia. The plain affords good pasture, and in the vicinity of the town are extensive vineyards and orchards. The town is very extensive, but a great part of it is now in ruins, owing to its frequent subjection to earthquakes; and the population, which at one time was estimated at 200,000, is now probably not much in excess of 25,000. Some velvets, brocades, and coarse cotton cloth are manufactured; and C. has also a considerable trade in raw silk, rice, etc.

CASCA, PUBLIUS SERVILIUS, the one among the assassins of Julius Cæsar, who, according to Plutarch, struck the first blow. This was done across the back of Cæsar's neck with a short sword, but the wound was not deadly, and the finishing of the work was left to Brutus and the others.

CASCADE, a co. in Montana; 2600 sq.m.; pop. '90, 8755. Co. seat, Great Falls.

CASCADE RANGE in Oregon and Washington; name of a mountain chain forming a continuation of the California coast range. The mountains are about 100 m. e. from the Pacific, and the more conspicuous peaks are Mts. Baker, Jefferson, Wood, Pitt, and Tacoma, the latter the highest point—14,444 ft. above tide.

CASCARA. See CASCARILLA.

CASCARILLA (i.e., little bark, from Span. *cascara*, bark), the name given in South America to many different kinds of bitter medicinal barks which form articles of commerce. Peruvian bark itself bears no other name in the districts which produce it; and the name C. has recently been introduced into medicine, of the bark of *Croton eleuteria*. It is a tonic, invigorating digestion, and promoting the functions of the stomach.

CASCO BAY, an indentation of the s.w. coast of Maine, about 20 m. wide, n.e. of cape Elizabeth, near Portland. The bay contains hundreds of small islands.

CASE, in grammar. See DECLENSION.

CASE, in law, primarily means a cause—that is, an action or suit taken as a whole. It has been said that the word “case” is more generally used with a broader meaning than “cause,” as referring to actions both at common law and in an equity court. The word is used in its general sense in the United States Constitution, which extends the judicial power of the United States to “cases in law and equity, cases affecting ambassadors, etc.” In a more limited sense, a case is one side of a suit or action—the body of evidence and law presented by one of the parties. The word also denotes a decision or dictum of the court already recorded and cited in argument; so the phrase *case law* is used to designate the species of legal argument founded in the citation of cases; hence also the phrase *leading cases*, meaning important decisions having a wide application and setting forth general principles which may govern many subsequent decisions. In the United States the term “Case” is often used in brief for *case on appeal*, meaning the statement laid before a court of appeal by an appellant and presenting the entire evidence in the original trial; thus allowing the appellate court to review the findings of the jury as well as the law points involved, and differing in this from the bill of exceptions, which presents to the court of appeal law points only. *Case agreed on* or *case stated* is a statement in which both parties to a suit unite in laying the facts of the case in which they agree before the court for a decision on the points of law involved. *Case reserved* is a statement drawn by counsel and certified to by the Judge to be laid for argument on law points before a full bench of the court. A very important form of action is sometimes called *case*, in brief for *action on the case*, or still more fully *action of trespass on the case*. This was designed to remedy certain defects in the common law practice which failed to provide an adequate remedy for some classes of injuries. The phrase “action on the case” is really equivalent to “action on the circumstances,” and this form of suit avails when it is sought to require damages for personal injuries not accompanied by violence, or where the subject in dispute was of such a kind that the injury was indirect or consequential. Thus where the wrong committed by the defendant lies in neglecting to do something which the relations of the party make his legal duty, action on the case for damages would lie. This form of action has been generally incorporated into the codes of legal procedure adopted by many of the United States, and still remains in constant use. In Great Britain the Judicature Acts have so classified injuries for which damages may be sought as in general to make this form of action obsolete.

CASE, in letter-press printing, a receptacle for types, generally made 34 in. long, 15 in. broad, and 1½ in. deep, and divided into compartments or “boxes,” each of which contains types of one class or letter. A pair of cases consists of an upper and a lower case: the upper one has 98 “boxes,” and contains the capitals, small capitals, and some other letters that are only occasionally required in composition; the lower one has 53 “boxes,” and holds the letters of the small character, figures, spaces, and most of the points. The places assigned to the several letters of the alphabet in the boxes of the case are not precisely the same in all printing-offices, but the differences are few. When in use, the cases lie on a frame 4 ft. high, and the compositor stands in front of them. The different sizes of the boxes in the lower case depend upon the comparative frequency in which the several letters occur in composition, and the position in the case allotted to each letter is such as to afford the greatest facility in composing. The letter *e*, which is most run upon in the English language, has a box much larger than any of the other compartments, and is placed directly in front of the compositor. In the upper case the boxes are of uniform size, and the letters are placed in alphabetical order, the comparatively rare occurrence of capitals rendering it immaterial which letter is nearest the compositor's hand. A case will hold a quantity of “letter” sufficient to “set up” three pages of this work, which is equal to 18,000 types.

CASE-HARDENING is the process of converting the surface of certain kinds of malleable iron goods into steel, thereby making them harder, less liable to rust, and capable of taking on a better polish. Fire-irons, portions of fine grate-fronts, gun-locks, and other articles of limited size, are very commonly so treated, but the process is sometimes applied to large objects, such as iron railway-bars. The articles are first formed of bar-iron, and being heated to redness, are sprinkled with a little powdered yellow prussiate of potash, and heated again. The result is, that the heat decomposes the prussiate of potash, and the liberated carbon combines with the iron, forming a coating of steel on the surface of the articles. Another mode of case-hardening is to heat the articles along with some animal matter, such as the parings of horns and a little common salt, from one half to several hours; the articles are then cooled in cold water, or in oil, when they are of a delicate nature. Charcoal alone is also employed. The coating of steel is very thin, seldom exceeding $\frac{1}{16}$ th of an inch. Where it is wanted to be thicker, the articles are treated several times. A Swedish iron-master has found that a very excellent case-hardening is obtained by treating iron objects with a mixture of animal matter and arsenious acid dissolved in hydrochloric acid, and heating as usual.

CASEINE, or **CASEUM**, is an organic compound allied to albumen (q.v.), found in the milk of the mammalia, and in pease, beans, and other leguminous seeds, when it receives the name of **LEGUMINE**. The proportion of C. in milk (q.v.) varies, but averages about 3 per cent, and it may be coagulated and separated therefrom by the addition of a little rennet (q.v.), as in the manufacture of cheese (q.v.), or by the employment of a few drops of a mineral acid, such as dilute sulphuric acid. In either case, the C. separates as *curd*, which still retains attached to it some oil and earthy salts, though the greater portion of these substances, along with the sugar, remains in the watery liquid or *whey*. The elementary bodies which enter into the composition of C., and the proportion in which these are present in 100 parts, are—carbon, 53.83; hydrogen, 7.15; nitrogen, 15.65; oxygen, 22.52; and sulphur, 0.85. The properties of C. are, that it is not coagulated by heat, as is well evidenced in the heating of milk, but is coagulated on the addition of rennet; sulphuric, hydrochloric, or nitric acids; alcohol, creasote, or infusion of galls, but not by acetic acid. It also forms insoluble precipitates with solutions of the poisonous salts, acetate of lead, nitrate of silver, and bichloride of mercury (corrosive sublimate), and hence the efficacy of taking large doses of milk in cases of poisoning by those deadly salts, as the C. in the milk, forming an insoluble compound with the poison, keeps it from exerting its deadly powers.

The form of C. obtained from plants, and termed **legumin**, is generally procured from leguminous seeds, like pease or beans, though it can also be extracted from the majority of vegetable substances, especially from sweet and bitter almonds, and even from tea and coffee. Dried pease contain a fourth of their weight of legumin, and this can be extracted by bruising the pease to powder, and digesting in warm water for two or three hours. The liquid is then strained through cloth, which retains the insoluble matters, and allows the water with the legumin dissolved therein, and with starch mechanically suspended, to pass through. On settling, the starch falls to the bottom of the vessel, and the clear liquid holding the legumin in solution, on the addition of a small amount of acetic acid, yields a precipitate of legumin or vegetable Caseine. So perfectly does the vegetable C. resemble the C. from milk, that the one can hardly be distinguished from the other by chemical tests or by taste; and at the present time there is regularly prepared in various parts of China, especially near Canton, a form of cheese from pease, which is sold to the populace in the streets of Canton under the name of *taofoo*. C. is a most important article of food. See **NUTRITION**.

CASEMATE, originally a loopholed gallery excavated in a bastion, from which the garrison could do execution upon an enemy who had obtained possession of the ditch without risk of loss to themselves. Hence the designation, from Span. *casa*, house, and *matar*, to kill. As defense from shells became more important, the term was subsequently applied to a bomb-proof vault in a fortress, for the security of the defenders, without direct reference to the annoyance of the enemy. A *casemated* battery consists of such a vault or vaults, with openings for the guns. A C. may also serve for barracks, or for an hospital, or for a store-house. The great want of ventilation in casemates renders them bad places for barracks; and the artillerymen are nearly stifled with smoke when firing from such confined places.

CASEMENT (It. *casamento*, a large house), a frame with hinges to open and shut, closing part of the glazing of a window. Windows of this description are rare in this country, but are almost universal on the continent. Also a name for a deep, hollow, circular molding, similar to the *scotia* of classical and the *cavetto* of Italian architecture. The C. is very prevalent in the perpendicular style of Gothic architecture, and is sometimes enriched with running foliage.

CASERNE is a barrack or building for the accommodation of the soldiers forming the garrison of a fortified town or post.

CASERTA, a t. of Italy, in the province of the same name, is situated on a plain about 17 m. n.e. of Naples. It is chiefly remarkable on account of its magnificent palace, one of the finest in Europe, and formerly the frequent residence of the Neapolitan court.

During 1860, C. acquired celebrity as the head-quarters of Garibaldi and his army. A royal silk manufactory has been established in the neighborhood. Population of commune, Dec. 31, 1894, 35,600.

CASE-SHOT, or **CANISTER-SHOT**, is an assemblage of bullets or small balls, inclosed in a cylindrical case or canister. The diameter of this canister is a little less than the bore of the gun from which it is to be discharged. According to the size of the canister, the balls vary from 1 lb. to $\frac{1}{2}$ oz. each, from 30 to 280 in number, and from $8\frac{1}{2}$ lbs. to 85 lbs. in total weight. The canister bursts immediately on leaving the gun, and the balls spread out into an irregular sort of cone. Within a range of 500 yards they work great execution among troops; they are generally used at 200 or 300 yards.

In a more modern and effective kind, called *spherical case*, the bullets are inclosed, along with a charge of powder, in an iron shell, instead of a tin canister. It is often called *shrapnel shell*, from the name of its inventor. A spherical case-shot for a 68-lb. carronade, or for an 8-inch howitzer, contains 337 balls; for a 24-pounder gun, 128; and for an 18-pounder, 90. It is exploded by a fuse, the length of which depends on the distance of the point where the destructive effect is to be wrought. Its effect is something like that of a prolonged musket-fire. The shrapnel shell is not of much use against the hull of a ship; but is very destructive against masses of men on shore, or on the decks of a ship, with a greater range than that of ordinary canister. Artillerymen prefer just such an amount of charge as will burst the sphere, without scattering the balls very widely.

CASEY, a co. in central Kentucky, on Green and Salt rivers; 444 sq.m.; pop. '90, 11,848, with colored. It has a rough surface and produces grain, tobacco, butter, and wool. Co. seat, Liberty.

CASEY, THOMAS LINCOLN, 1831-96; b. Sacketts Harbor, N. Y.; military engineer. He graduated at the U. S. military academy, and entered the engineer corps of the army, 1852; became chief of engineers, and brigadier-general 1888; and, as superintending engineer of public buildings and grounds in the District of Columbia, had charge of the Potomac aqueduct, the completion of the Washington monument, and the State, War, and Navy departments building, and the construction of the Medical Museum and library.

CASH ACCOUNT, or **CASH CREDIT**, a form of account with a bank, by which a person is entitled to draw out sums as required by way of loan to a stipulated amount. The practice began about 1729 in Scotland, with the banks of which country it is still peculiarly identified; but it is not unknown elsewhere, though on a somewhat different plan. In connection with the Scotch banks, the C. A. system is placed on a distinct and secure basis, which we shall briefly describe. The persons procuring a credit of this kind are for the most part retail-dealers, tradesmen, and farmers, who possess a limited capital, and need occasional loans. Instead of borrowing money by bills or mortgages, they apply to a bank for a C. A. to the extent, it may be, of £500. In the origin of the system, the bank may be said to have been influenced by three considerations—first, the necessity for making advantageous use of its capital; second, the desire to extend its issues of small notes; and third, the nature of the security offered. Since sir Robert Peel's act restricting circulation of notes, the second of these reasons no longer operates; for the banks are now much above their authorized issue, and must hold an equal amount of coin against the surplus. What the bank particularly wants, is a customer who will be constantly depositing sums in notes of other banks, and drawing out sums in its own notes. The C. A. system aids this process. It secures a customer who will be frequently operating on his account, according to the exigencies of his business, and whose overdrafts, as well as deposits, tend to benefit the concern. Obviously, for the debtor, the system works more advantageously than when a fixed sum is borrowed, for in that case interest would run on for the whole amount, whereas by a C. A. the trader merely draws what he requires; and by paying in his surplus money in small sums, he is charged with interest only on the sum actually at his debit from day to day. In negotiating a C. A., a bond is prepared by the bank stating the amount and the nature of the security, the cost of which is borne by the borrower. Banks often, in security, accept heritable property and policies of life insurance, but more commonly two persons in good credit become cautioners, or co-obligants along with the principal. Unless the liability of the cautioners respectively be expressly limited in the bond, each is liable for the whole amount. If the bank liberates one cautioner without the consent of the other, it loses its recourse. This recourse is not lost by accepting a dividend from the sequestrated (bankrupt) estate of a principal or cautioner; but it will be lost by accepting a composition from either of these persons without consent of the other. The bank can at any time stop the credit, and call for payment of the balance due. A cautioner can at any time withdraw his name from the credit, on paying up the balance, and the bank is bound to assign the debt to him. While cash accounts may be of great service to traders who act upon them discreetly, it is found that, in too many instances, these accounts are used as a dead-loan to the entire amount stipulated for; and for this, as well as a reason above assigned, banks care now very much less for this kind of business than formerly. Properly, traders are to look on the money procured on cash credits not as an addition to capi-

tal, but merely a temporary substitute for current business purposes while the capital is out with customers, and to be replaced accordingly until again required. It may be added that the progress of commercial wealth in Scotland now greatly lessens the necessity for having recourse to C. A. system. See MARGINAL CREDIT.

CASHEL, a t. of Ireland in Tipperary co., and 105 m. s.w. of Dublin by rail. It is irregularly built on the s. and e. slopes of an isolated height, rising abruptly from a rich and extensive plain, two miles e. of the river Suir. Pop. about 3,500. C. is a Roman Catholic archdiocese. The ancient kings of Munster resided here. The top of the height, or "Rock of Cashel," is occupied by an assemblage of the most interesting ruins in Ireland, which have a grand effect from the country around. The ruins consist of a cathedral, the largest and most remarkable in the country, founded 1169, burned 1495, and afterwards repaired; a stone-roofed chapel, built 1127 by Cormac McCarthy, king of Munster, and the most perfect specimen of the kind in the country; Hore abbey, founded 1260; the palace of the Munster kings; and a round tower, 90 ft. high and 56 in circumference. The round tower is built of freestone, but the other ruins of limestone. At C., in 1172, the great synod was held in which the Irish prelates first acknowledged the authority of the English king and church.

CASHEW NUT, *anacardium occidentale*, a tree of the natural order *anacardiaceae*, a native probably of the tropical parts of both hemispheres, although it has been commonly regarded as of American origin. It is a spreading tree of no great height. It abounds in a clammy, milky juice, which turns black on exposure to the air, and is used in India for varnishing, but is so acrid as to produce painful inflammation when it comes in contact with the skin of some persons, or when they are exposed to its fumes. Others are apparently unsusceptible of its influence. The fruit of this tree is a kidney-shaped nut about an inch long, seated on the thicker end of a pear-shaped fleshy stalk, from which the botanical character of the genus is derived. The shell is double, the outer shell being ash-colored, and very smooth; and between it and the inner is a layer of very caustic black juice. The kernel is oily, and very pleasant and wholesome, and is in common use as an article of food in tropical countries, being made into puddings, roasted, and in various ways prepared for the table. In the West Indies, it is put into wine, particularly old Madeira wine, to which it is thought to communicate a peculiarly agreeable flavor, and for this use it is sometimes imported into Britain. It is also for the same reason sometimes an ingredient in chocolate. Yet the vapor which arises from it in roasting, but which is derived from the coating of the kernel, and not from the kernel itself, is so acrid as to cause erysipelas and other painful affections of the face in those who conduct the process, unless great caution is used.—The fleshy stalk, sometimes called the *cashew apple*, varies in size, being sometimes not much larger than a cherry, and sometimes as large as an orange, and is white, yellow, or red. It is perfectly free of the acidity characteristic of the natural order, is acid and eatable, very pleasant and refreshing, and much used by the inhabitants of the countries in which the tree grows. A very pleasant vinous liquor is obtained from it by fermentation; and this by distillation yields a spirituous liquor, highly esteemed for its flavor. A gum which exudes from the bark of the tree, quite distinct from the milky juice already mentioned, is bland, and very similar to gum-arabic.

CASHGAR, or **KASHGAR**, the capital of the province of Sin Kiang in eastern Turkistan. C. stands 140 m. n.w. of Yarkand, in lat. 39° 25' n., long. 73° 57' e. It is a point of considerable strategic importance, being at the junction of roads leading to India, Russia, and Peking. It has manufactures of cotton, gold and silver cloths, carpets, etc.; and an extensive trade with Central Asia. Pop. estimated at 50,000. It was connected with Peking by telegraph line in 1894. C. is said to have been an important commercial town before the Christian era, and was possessed for about a century by the Chinese. See TURKISTAN.

CASHIERING is a punishment for officers in the army and navy. It is a severe form of dismissal from the military service, and implies that the officer, by some disgraceful conduct, has deserved not only dismissal, but disqualification for ever again entering the service. Sometimes there are words added implying still deeper ignominy and degradation. On some rare occasions, when a court-martial has awarded C., the commander-in-chief has mitigated the punishment to simple dismissal. "Scandalous and infamous conduct," and "conduct unbecoming the character of an officer and a gentleman," mark two degrees of offense which may lead, the one to C., the other to dismissal.

CASHMERE, a valley of the Himalaya, between India proper and middle Thibet, stretching between lat. 33° 15' and 34° 35' n. and long. 74° 10' and 75° 40' e. Its bottom, a comparative level of about 2000 sq. m., is 5500 ft. above the sea; while the inclosure, as a whole, from ridge to ridge, besides fully doubling the area, attains, at some points, nearly thrice the altitude. The mountain-wall of this secluded region presents but few passes, and most of these too lofty to be practicable in winter. In fact, the Baramula itself does not admit a wheeled vehicle. Through this single opening, situated at the s.w., the Jhelum carries down towards the Punjab the gathered streams and lakes of the entire basin, and is navigable for the last 70 m. of its course. This net-work of waters, without swelling into inundations, affords everywhere a perennial supply for the purpose of irrigation. Besides the copious rains of spring, the snows of winter covering

even the plains to a depth of two feet for four months, accumulate, in every gorge and on every declivity, reservoir above reservoir, against the demands of summer. C. is traditionally believed to have been a vast upland lake, and alluvial deposits beyond the reach of existing influences would seem to confirm the idea.

In regard to climate, moderate but steady frost prevails from Nov. to Mar.; and again, the heat, ranging from 75° F. in June, to 85° in August, is often disproportionately oppressive, through the stagnation of the landlocked atmosphere. The staple production is rice, which, from the singular facilities of irrigation, is an all but sure crop, yielding, even in a tolerable season, 30 or 40 returns; and in the abundance and excellence of its fruits, C. is said to surpass all the rest of the world. The valley is, in general, considered to be remarkably healthy. The inhabitants, almost universally held to be models of strength and beauty, amounted, before 1828, to 800,000, or to 400 in a sq. mile. The people are mostly Mohammedans, divided between the Sunnite and Shiite sects. The Hindus in 1891 numbered 691,800. The manufactures—all superior of their kind—are shawls, leather, fire-arms, and attar of roses. The principal towns are Serinagur, Islamabad, Shupayon, Pampur, and Baramula. The history goes back, through colossal monuments chiefly of marble, beyond the dawn of authentic annals. In 1315, C. first received Mohammedanism; in 1586 it was annexed to the Mogul empire; in 1752 it fell under the power of the Afghans; and in 1819 it was subjugated by the Sikhs. Lastly being ceded, at the close of the first war of the Punjab, to the British, it was by them transferred to Gholab Sing, as the nucleus of a state of its own name, which comprised also Jamu, Bulti, Ladakh, Chamba, etc. Since 1889 it has been under British administration. Area of principality, 80,900 sq. m.; pop. '91, 2,543,952.—C. or Srinagar, the capital, lies on the Jhelum, about the center of the valley.

CASHMERE GOAT, a variety of the common goat, remarkable for its very long, fine, and silky hair, from which the highly valued Cashmere shawls are made. It is not so much in Cashmere that this variety of goat is to be found, as in Thibet, from which the finest goat-hair is imported into Cashmere, to be there manufactured into shawls. The hair is even longer than that of the Angora goat, and not, like it, curled into ringlets, but straight. It is about 18 in. long. A single goat does not yield more than three ounces, and the fleeces of ten goats are requisite for the manufacture of a shawl a yard and a half square. The hair is spun by women, and dyed after it is spun. It is said that 16,000 looms are kept in constant employment in Cashmere, producing annually about 30,000 shawls. The shawls are woven in rudely constructed looms, a pair of shawls sometimes occupying three or four men a whole year in weaving. C. shawls, of the finest quality, are sold in London at from £100 to £400 each. Plain shawls are simply woven in the loom, but those with variegated patterns are worked with wooden needles, a separate needle being used for each color. These shawls are in the highest request in India; but the hair of several other breeds of goat inferior to that of Thibet is employed for the manufacture of shawls called by the same name. Imitations of these are manufactured in France rather extensively, some from the Thibet wool entirely, and others of a mixture of this with silk and cotton. It is said that 24 lbs. of the best Thibetan goat-hair sell in Cashmere for 20 rupees, or \$50.

Attempts have been made to introduce the C. G. into Europe. Baron Alstroemer attempted, in the end of last century, to naturalize it in Sweden; and a very spirited attempt to introduce it into Britain has recently been made by Mr. Towers. A mixed race, produced by crossing the C. G. and the Angora goat, has been found to possess most valuable qualities, the hair being long, fine, and more abundant than in any of the parent breeds.—The male of the C. G. has very large, flattened, wavy horns.

CASIA, or **POET'S CASIA** (*osyris alba*), a shrub of the natural order *santalaceæ*, a native of the s. of Europe, 3 to 4 ft. high, with linear-lanceolate deciduous leaves, long supple branches, numerous small white flowers, and red drupes (stone-fruit) of the size of a pea. The branches are used for making crates. The shrub has been much admired for its modest beauty. Keats speaks of

“The drooping flowers
Of whitest casia, fresh from summer showers.”

CASIMIR, properly Kazimierz, was the name of many Polish princes and kings. With the establishment of the power of Casimir I. in 1040, the predominance of Christianity was decided in Poland. But the most distinguished of this name was Casimir III., called Casimir the great, b. 1309, succeeded his father, Vladislaus Loketek, as king of Poland in 1333. He added little Russia and Red Russia to his dominions; repelled the Tartars, who then threatened Poland; and waged successful war in Silesia, which he conquered but did not retain. He showed great anxiety for the advancement of the arts and of learning in his kingdom, and for the improvement of the condition of the most oppressed classes, which won him the title of king of the peasants. A Jewish mistress obtained from him liberties for the Jews, which they have since retained in Poland. He died in consequence of the falling of his horse in 1370.

CASIMIR I. (see **CASIMIR**), b. 1015, “the peaceful,” son of the Polish king, Miecislav II., and a German princess named Rixa. The mother endeavored to rule during

C.'s minority, but was compelled to fly to Germany, her son following her and leaving Poland in anarchy. In 1040, C. was called upon by his country, and, with the help of the German emperor, established his authority, drove out the plundering Bohemians, and earned the name of "the restorer." He left a moderately well organized government to his successor. He died 1058.

CASIMIR II., surnamed "the just," 1138-94; one of the four sons of Boleslas, king of Poland, and ruler over the reunited kingdom after the expulsion of Miecislus III. in 1177. Under C. II. the first Polish senate was organized, and laws were enacted defending the peasants against the oppression of the nobles.

CASIMIR IV., 1427-92; brother and successor, as king of Poland, of Ladislas III. He reigned 48 years; waged successful wars against the Teutonic knights; kept his country for most of the time in peace and prosperity; and introduced Latin into schools and official business. Of his six sons, three succeeded each other on the throne, one became king of Hungary and Bohemia, one was a cardinal, and one was canonized.

CASIMIR-PÉRIER, JEAN PAUL PIERRE, fifth President of the third French Republic, was born in 1847 of distinguished ancestry. He served as a volunteer in the defense of Paris against the Germans in 1871, and in 1874 was elected to the Chamber of Deputies. After serving as Under Secretary of State in the Department of Public Instruction, he became in 1883 Under Secretary for War, and in 1890 President of the Chamber of Deputies. In December, 1893, he was appointed Premier by President Carnot, on whose assassination, in 1894, he was elected President of the Republic (July 7). Owing to the conflict of factions among the Deputies, he resigned Jan. 15, 1895.

CASINO, an Italian diminutive of *casa*, a house, signifies a place for social reunions. The Italian nobles have long had casinos detached from the palaces in which they live, whither they can retreat and enjoy themselves, and it is probable that the *public* casinos were the result of an attempt made by the middle classes to imitate their superiors. In Italy, a C. is generally close by a theater, and is a place where musical or dancing soirées are held, containing a conversation-room, billiard-room, and café.

CASINO, or **MONTÉ-CASINO**, a mountain overhanging the town of Cassino (the ancient Casinum), in the Italian province of Caserta, between 50 and 60 m. n.n.w. of Naples, is celebrated on account of the monastery founded here by St. Benedict (q. v.) in 529 A.D. This monastery is remarkable for its noble architecture, its ancient wealth, its library and archives, and in modern times for the learning of its monks, who have a printing-press, from which several important works have issued. The beautiful situation of the abbey, and the reputation of the monks as masters of the healing art, formerly made Monte-Casino a favorite resort of pilgrims. See Luigi Tosti, *Storia della Badia di Monte-Casino* (1841-3), giving an account of the literary treasures in the library of the abbey. Pop. of the commune of Casino, about 13,000.

CA'SOLI, a t. of Italy, in the province of Abruzzi and Molise, situated on a hill 21 m. s. of the city of Chieti. Pop. between 5,000 and 6,000.

CASO'RIA, a t. of Italy, 5 m. n.n.e. from Naples. Silk is produced in the district. Pop. about 10,000.

CASPIAN SEA, an inland sea or great salt lake, the largest in the world, on the boundary between Europe and Asia, extending from lat. 36° 40' to 47° 20' n., and long. 46° 50' to 55° 10' east. Its length from n. to s. is about 700 m., and its average breadth about 200 miles. Its total area is estimated at 180,000 sq. miles. The coast-line is irregular, and on the e. side especially there are several bays and indentations of coast, the principal being those of Mertvoi, Mangushlak, Kenderlinsk, Karabugos, and Balkan. From the w., the naphtha-impregnated peninsula of Apsheron stretches into the C. opposite the Balkan gulf; Mt. Caucasus also rises on its w. side. On the s. rises the lofty range of the Elburz mountains, between which, however, and the coast, on this side almost unbroken, extends a low flat plain of from 15 to 20 m., in breadth. On the n., it is bordered by great steppes, and the country eastward is a vast plain. It is probable that at one time its waters, which are said to be still diminishing, covered great part of the adjacent steppes. Some singular changes appear to take place in the level of the Caspian. Various measurements have made its depth and elevation different. One Russian measurement made it 348 ft. below the level of the Black sea, another only 84 feet. The latter is confirmed by maj. Wood (*The Shores of Lake Aral*, 1876). It has no tides, but its navigation is dangerous because of violent storms, especially from the s.e., by which its waters are sometimes driven for many miles over the adjacent plains. The depth near the southern end, is about 600 ft., and in some places near the center it attains a depth of nearly 3,000 ft.; but near the coast it is very shallow, seldom reaching a depth of more than 3 ft. at 100 yards from the shore, and in many places a depth of 12 ft. is not reached within several miles of the beach. On the n.e. and e. it is especially shallow. It receives the waters of a number of large rivers, of which the greatest is the Volga. The Ural, the Terek, the Kur, and the Atrek also fall into it. The water of the C. S. is salt, but much less so than that of the ocean. Its northern parts are covered with ice during winter. It abounds in fish, and very valuable fisheries are carried on, especially for sturgeon and salmon. By a canal uniting the head-waters of the Volga with the rivers Tvertza and Schlina, the

C. is united with the Baltic sea. The sea is now surrounded on three sides by Russian territory, the southern shore still remaining Persian. The Russians have a fleet stationed upon it, and the most of its commerce is in their hands. Steam packets have been established on it. The chief Russian town upon its shores is Astrakhan; less important are Petrovsk, Derbend, Guriev, Baku, Krosnoi-yar, and Mikhailovsk, the head of the Transcasian railway. Balfrush, Reshd, and Astrabad are Persian towns. The practicability of making the Amu-Daria (see OXUS) now running into the sea of Aral, again an affluent of the C. S., has recently been much debated.

The C. S. was known to the Greeks and Romans; according to Strabo, it derived its name from the Caspi, a tribe inhabiting its western shores. The name Caspian was afterwards limited to the western portion of the lake—the eastern being designated the Hyrcanian sea.

CASQUE. See HELMET.

CASS, a co. in w. Illinois, on the Illinois river, intersected by three railroads; 360 sq. m.; pop. '90, 15,963. The surface is level prairie and woodland; and the soil is very fertile, producing corn, wheat, oats, etc. There are also a number of manufactories of flour, lumber, paper and carriages. Co. seat, Virginia.

CASS, a co. in n.w. Indiana, on Wabash and Eel rivers, traversed by the Wabash and Erie canal and several railroads; 420 sq. m.; pop. '90, 31,152. With the exception of bluffs near the rivers, the surface is almost level prairie and forest, producing cereals, butter, wool, etc. Co. seat, Logansport.

CASS, a co. in s.w. Iowa, on the tributaries of Nodaway river, and intersected by the Chicago, Rock Island and Pacific railroad; 576 sq. m.; pop. '90, 19,645. It is in an agricultural region. Co. seat, Atlantic.

CASS, a co. in s.w. Michigan, on the Indiana border, traversed by the Lake Shore and Michigan Southern, the Chicago and Grand Trunk, and the Michigan Central railroads; 504 sq. m.; pop. '90, 20,953. The surface is level prairie, with oak openings, and dense forests. Iron and limestone are found. Other productions are mainly agricultural, and there is considerable manufacturing business. Co. seat, Cassopolis.

CASS, a large co. in n. central Minnesota, partly bounded by the Mississippi river; 2990 sq. m.; pop. 1890, 1247. There are numerous streams and a great number of large and small lakes. The northern Pacific railroad passes through the s. part.

CASS, a co. in w. Missouri, on a branch of Osage river, and in part crossed by the Pacific railroad of Missouri; 688 sq. m.; pop. '90, 23,301, incl. colored. Surface mostly prairie; productions agricultural. Co. seat, Harrisonville.

CASS, a co. in s.e. Nebraska, on the Platte and Missouri rivers, intersected by the Burlington and Missouri Pacific railroads; 530 sq. m.; pop. '90, 24,080. The surface is chiefly prairie, well watered and fertile; productions agricultural. Co. seat, Plattsmouth.

CASS, a co. in s.e. N. Dakota, organized in 1873; on the Red river of the north. The northern Pacific and other railroads intersect. The surface is of river valleys and undulating prairie, and the soil is generally fertile; 1764 sq. m. Pop. 1890, 19,613. Co. seat, Fargo.

CASS, a co. in n.e. Texas, on the Arkansas and Louisiana border, created in 1846, bounded n. by Sulphur fork, a tributary of Red river; 950 sq. m.; pop. '90, 22,554, incl. colored. It has a heavily wooded and fertile soil, producing cotton, rice, corn, etc. Co. seat, Linden.

CASS, LEWIS, an American statesman, b. at Exeter, N. H., in 1782. He was educated for the law, but quitting that profession, he entered the army in 1812, and rose rapidly to the rank of gen., though his merit was not very conspicuous. In 1813, he was elected governor of Michigan, in which state he settled. During his governorship, he kept himself apart from party politics, yet all his measures had a decidedly democratic tendency. In 1831, C. was made minister at war under gen. Jackson, and in 1836 he was sent as plenipotentiary to Paris. In this capacity he made himself popular by his replies, in *Galignani's Messenger*, to the attacks of the English press on the claims of the union with regard to its n.e. boundaries, and by his protest against the measures of Guizot; but the treaty concluded by Daniel Webster with lord Ashburton was so much opposed to the views maintained by C., that he resigned his post, and in 1843 returned to America, where he was received with marks of popular favor. He now aimed at the presidency, and in 1844 was put in nomination, but was defeated, as also in 1848, when he made another effort to obtain the supreme office. In 1857 he was appointed secretary of state, resigning office in 1860. Though active and energetic, he had no claim whatever to anything like comprehensive statesmanship. In regard to slavery, his ideas were ludicrously inconsistent, determined solely, as it would seem, by a view to what would be popular with those whose favor he was seeking to secure at the moment. Latterly, he supported the slave-holding party until the slave states seceded in 1861, from which time he was an ardent supporter of the union. But he was chiefly remarkable on account of his bitter hostility to Britain, against which he was ever ready to inflame the minds of his countrymen on the slightest and silliest pretext. He is author of the *History, Tradition, Languages, etc., of Indians in the United*

States; of France—its King, Court, and Government; and other works. He died in June, 1866. See McLaughlin, *Lewis Cass* (Boston, 1891).

CASSABA, or CASABA, a t. in Asia Minor, 63 m. e. of Smyrna, with which it is connected by a railroad. C. has a flourishing trade with the surrounding district. Cotton is one of the chief articles of trade, and silk-worms are raised for export. Another valuable industry is the raising of melons for the Constantinople market. In 1865 a large portion of the town was destroyed by fire, and in the same year there were many deaths from cholera. Pop. about 23,000, three-fourths of whom are Mohammedans.

CASSAGNAC. See GRANIER DE CASSAGNAC.

CASSANDER, king of Macedonia, and son of Antipater, was b. about 354 B.C. When young, he is said to have been ill used by Alexander the great, and to have consequently conceived a mortal hatred to that monarch's family. On the death of his father, he expected to succeed to the regency; but Polysperchon received the honor instead, which so dissatisfied him, that he resolved to contest the sovereignty with his opponent. He was completely successful; but while pursuing his career of conquest in the s. of Greece, he learned that Olympias, mother of Alexander, was committing havoc in the north, and consequently hurried back to Macedonia. In less than a year Olympias was taken prisoner, and put to death. Only Roxana, wife of Alexander, and her son Ægus, now stood between him and the throne of Macedon; but he did not find it convenient to "make away" with these two until several years had passed. Meanwhile, he married Thessalonica, half-sister to Alexander, in whose honor he founded, about 316 B.C., the town which bears her name. In the following year he caused Thebes, which Alexander had destroyed, to be rebuilt. He next became involved in a war with Antigonus, king of Asia, which, with an intervening peace of one year, lasted from 315 to 301 B.C., in the last of which years Antigonus was defeated and slain at the battle of Ipsus. Along with his auxiliaries, Seleucus, Ptolemy, and Lysimachus, he seized and shared the dominions of the vanquished. The rest of his life was spent in intrigue and military enterprise. He died 297 or 296 B.C.

CASSANDER, GEORGE, 1515-66; a native of Zeeland; professor of classics at Bruges and Ghent; spent most of his life in trying to effect a union between the Roman Catholic and Protestant churches; to which end he published several works, which had the distinction of being both fiercely attacked by Calvin and pointedly denounced by the council of Trent.

CASSANDRA, according to Homeric legend, was the fairest daughter of Priam and Hecuba, and the twin-sister of Helenus. The children playing in the court of the temple of the Thymbrean Apollo, not far from Ilium, till it was too late for them to return home, a bed of laurel twigs was made for them in the temple; and there, in the morning, two snakes were found licking their ears, from which resulted such an acuteness of hearing, that they could hear the voice of the gods. C. afterwards attracted the love of Apollo by her beauty, and he taught her the secrets of prophecy; but displeased by her rejection of his suit, laid upon her the curse that her vaticinations should never be believed. Accordingly, she prophesied in vain of the treachery of the Grecian horse and the destruction of Troy. On the capture of the city, she fled to the temple of Minerva, but was torn from the altar by the Locrian Ajax, and ravished in the temple. She afterwards, in the distribution of the prey, fell to the share of Agamemnon, to whom she bore twin sons, but was murdered by Clytemnestra.

CASSANDRA, a peninsula in the province of Roumelia, European Turkey, situated between the gulfs of Salonica and Cassandra, in lat. 40° n., long 23° 30' e. The ancient name of this headland was *Pallene*. Grain of superior quality is raised here; wool, honey, and wax are produced; and silk-worms are extensively reared. The gulf of Cassandra (ancient *Toronaicus Sinus*) has a length of 33 m. from s.e. to n.w., and a breadth of 10 miles.

CASSANO, a t. of Italy, in the province of Cosenza, 34 m. n. of the town of that name. It is situated in a valley in the midst of the most beautiful scenery, has a cathedral, an old castle built on an imposing mass of rock in the midst of the city, and manufactures of linen, leather, silk, cotton, and macaroni. Pop. 9,000.

CASSANO, a t. of northern Italy, 17 m. e.n.e. of Milan. It is situated on the right bank of the Adda, here crossed by a bridge on the railway to Brescia, and has extensive silk-mills. C. was the scene of two sanguinary battles—one in 1705, between the French under the duke de Vendôme, and the imperialists under prince Eugene, in which the latter were defeated; the other in 1799, when the Russians and Austrians under Suwarow defeated the French under Moreau. Pop. 4,500.

CASSATION, COURT OF. In the law of France, the act of annulling the decision of a court or judicial tribunal is called *cassation*, from the verb *casser*, to break or annul (Lat. *quaterere*; Eng. *quash*); and the function of cassation, as regards the judgments of all the other courts, is assigned to a special tribunal called the court of C., which may thus be regarded, in a certain sense, as the last and highest court of appeal for the whole country. But as everything is excluded beyond the question whether or not the view taken of the law, and of the proper method of administering it by the inferior tribunal, has

been the right one, the idea attached to this institution is less that of a court in the ordinary sense, than of a department of government to which the duty of inspecting the administration of justice is assigned. By the 65th article of the constitution of the year VIII., it was enacted that there shall be "for the whole of France a tribunal of cassation, which shall pronounce on demands for cassation against judgments in the last resort pronounced by the tribunals;" and the following article of the same constitution bears that this supreme tribunal shall pronounce no judgment on the foundation or merits of the cause, but that, in case of its breaking the judgment pronounced, it shall remit to the tribunal appealed from to pronounce another. The title of tribunal was afterwards changed for that of court, by a *senatus consultum* of the year XII.; but substantially the institution has retained its original character, notwithstanding all the changes of government which have occurred in France. The demand for cassation can be made only by the parties to the suit, or by the *procureur-général* of the court of C. for the public interest. Criminal as well as civil judgment may be reviewed by the court of C., the only exceptions being the judgments of justices of the peace and of courts-martial, military and naval. The delay allowed for bringing a civil case before the court of C. is three months for persons domiciled in France, six months for those in Corsica, a year for American colonists, and two for all persons resident beyond the cape of Good Hope. In criminal matters, the procedure is greatly more prompt, three full days only being allowed to the person condemned to bring his action of C., and the same space being given to the *procureur-général*. In all criminal and police cases, the court of C. may pronounce judgment immediately after the expiry of these days, and must do so within a month. The court of C. is divided into three sections, one of which is devoted to criminal matters. Its staff consists of a president, who has the title of *first* president, and three vice-presidents, who are called presidents; 45 counselors or ordinary judges; a *procureur-général*, or public prosecutor; 6 substitutes, who have the title of advocates-general; and several inferior officers. The presidents and counselors are named by the executive for life, the other officers being removable at pleasure. No judgment can be pronounced unless 11 judges are present, the decision being determined by the majority. Where the numbers are equally divided, 5 judges are called in; and cases of peculiar difficulty may be judged of by the three sections united. The whole court, when presided over by the minister of justice, possesses also the right of discipline and censure over all judges for grave offenses, not specially provided for by the law. When thus constituted, the court of C. may suspend the judges of the imperial courts from the exercise of their functions, and call them to its bar. The *procureur-général* of the court of C. likewise possesses a surveillance over the *procureurs-généraux* of the imperial courts.

The members of this august tribunal wear a red gown with a violet *toque*, or cap of velvet; the robes of the presidents and of the *procureur-général* being doubled with white fur.

CASSAVA, a West Indian name of the plant also called Manioc (q.v.), and of the starch produced from it, which is otherwise called Brazilian arrow-root, and is popularly known in Britain as Tapioca (q.v.).

CASSAY, or **MANIPUR**, a mountainous country in farther India, to the s.e. of Upper Assam, stretching from 23° 49' to 25° 41' n. lat., and from 93° 5' to 94° 32' e. long., and having an area of 8,300 sq. miles. It contains a pop. estimated at 220,000. It is important to England merely from its being on the Burmese frontier. Accordingly, before the war of 1825 began, it was occupied by the British; and, being permanently ceded at the close of the contest, it was handed over, free from tribute, to the native rajah. The inhabitants are more generally Brahmanists than Buddhists. The productions are tea, rice, tobacco, indigo, cotton, sugar, opium, and mustard. Chief town, Manipur.

CASSEL, the capital of the former electorate of Hesse-Cassel, now a portion of Prussia, pleasantly situated on both sides of the Fulda, here a navigable river, 120 m. by rail n.e. of Frankfurt-on-the-Main. It contained (1895) 81,758 inhabitants, including military and servants and laborers connected with them. The oldest part of the town consists of a few very narrow, crooked streets, close on the banks of the Fulda; the more modern parts are on hills, which rise gently from the river. C. is partially walled. In Friedrichs-Platz, the largest square in any German town, stands the elector's palace, a comparatively mean structure: a little below is the first story of a magnificent palace commenced in 1820, and stopped in the following year by the death of the elector who projected it. Amongst the other public buildings and institutions, one of the most important is the *Museum Fridericianum*, which has a large library containing valuable manuscripts. The picture-gallery contains a large number of paintings, including some excellent specimens of the best masters. In the cabinet of curiosities there are examples showing the gradual development and improvement of watch-making from the earliest invention at Nuremberg to the present time. C. contains an observatory, and is the seat of a number of learned and scientific associations. From 1807 to 1813 it was the capital of the kingdom of Westphalia. The gardens of Wilhelmshöhe—which was assigned by the present emperor of Germany to the late emperor Napoleon as a resi-

dence after his fall at Sedan, in Sept., 1870—with their splendid fountains and cascades, and the colossal statue of Hercules, within the hollow of whose club eight persons can stand at one time, are only 3 m. from Cassel. Among its manufactures are textiles, machinery, iron wares and scientific and musical instruments. Under the name of *Chassala*, the town appears to have existed as early as the 10th century.

CASSEL, a t. of France, in the department of the Nord, 27 m. n.w. of Lille. It is pleasantly situated on a hill, overlooking a country on all sides so flat, that the view, although the elevation is only 800 ft., is said to be one of the widest in Europe, extending over the broad fertile plains of Flanders, and to the chalk cliffs of England, and taking in 32 towns and 100 villages. During the great trigonometrical survey undertaken in the reign of the first Napoleon, Mont Cassel was one of the chief signal-stations. C. has manufactures of lace, linen, thread, hosiery, etc. Pop. '91, 3931. It was known to the Romans, who had a station here, as *Castellum*.

CASSEL, PAULUS STEPHANUS SELIG, b. 1821; a German author of Jewish descent; educated both in Roman Catholic and Protestant schools; finished his studies under Ranke in Berlin, and became a journalist. He was in the Prussian chamber of deputies, 1866-67, and declined re-election, preferring to become minister of Christ church, Berlin. He has published articles and books on the Jews, and on religion and politics.

CASSIA, a southern co. of Idaho, formed in 1879, and bounded on the n. by Snake river; 4500 sq.m.; pop. '90, 3143. Co. seat, Albion.

CASSIA, a name given by the ancients to a kind of medicinal bark, but their descriptions are so imperfect that it is impossible to determine what bark it is. The name is employed in the English translation of the Old Testament in Exodus xxx. 24, and in Psalms xlv. 8, its use in these places being derived from the Septuagint; and it is not improbably supposed that the substance intended is the same now known in our shops as *C. bark*, or *C. lignea*.—2. *C.* is now the botanical name of a genus of plants of the natural order *leguminosæ*, sub-order *cæsalpineæ*, containing many species—more than 200 having been described—trees, shrubs, and herbaceous plants, natives of Africa and of the warm parts of Asia and America. They have abruptly pinnate leaves, and flowers with deciduous calyx of five somewhat unequal sepals, corolla of five petals, of which the lower ones are the larger, ten free stamens, of which three are long, four short, and three abortive, and anthers opening by two holes at the top. The leaves and pods of many species have a peculiar sweetish but nauseous smell, and a nauseous bitter taste accompanied with a loathsome sliminess. They seem all to contain the purgative principle called cathartine (q.v.), and the leaves of some of the Asiatic and African species are highly valued, and much used as a medicine, under the name of SENNA (q.v.). The leaves of *C. Marylandica* possess similar properties, and are now used to some extent in the United States of America.—*C. fistula* (*cathartocarpus*) yields the *C.* of the pharmacopœias, the *C. pods*, *pipe C.*, or *purging C.* of the shops. It is a large tree, a native of Egypt and other parts of Africa, perhaps also of the East Indies, in which, at all events, it is now widely diffused and cultivated, as well as in the West Indies and warm parts of America. Its leaves have 4 to 6 pair of ovate smooth leaflets, its flowers are yellow and in loose racemes; its pods, which have obtained for it the name of *pudding-pipe tree*, are sometimes 2 ft. in length, cylindrical, black, consisting of thin brittle woody valves, within which is a cavity divided by numerous thin transverse partitions, each cell containing a single seed imbedded in a soft black pulp. It is this pulp that is the part used in medicine; it has a sweetish mucilaginous taste, and in small doses is a mild laxative. It is sometimes removed from the pods when fresh; or an extract is obtained, after they are dried, by boiling and evaporating. It is said to contain 61 to 69 per cent of sugar. The *C. pods* of the West Indies contain much more pulp, and are therefore more valuable than those imported from the East.—3. *C. bark*, or *C. lignea*, sometimes called *China cinnamon*, is a bark very similar to cinnamon both in appearance and properties; but in thicker pieces, and less closely quilled, of a less sweet and delicate flavor, but more pungent. It is the produce of the *cinnamomum C.*, or *aromaticum*, a tree of the same genus with the cinnamon-tree, a native of China, and extensively cultivated there. It is highly esteemed by the Chinese, and is now largely imported into Europe. As it contains a greater proportion of essential oil, and is also much cheaper than true cinnamon, it is much more generally used. The oil which it contains is called *oil of C.*, and is very similar to oil of cinnamon. Coarse cinnamon is sometimes sold as cassia. *C. buds* are believed to be the dried flower-buds of the same tree which yields *C. bark*. They are now imported into the U. S. in large quantities, and are much used in confectionery. In flavor and other qualities they resemble *C. bark*; in appearance they are very similar to cloves.

CASSIANUS, JOANNES, or JOANNES MASSILIENSIS, or JOANNES EREMITA, a Christian teacher of the ancient church, who flourished in the early part of the 5th c., and distinguished himself as the promoter of monachism in Southern Gaul, and as the opponent of the extreme dogmas of St. Augustine respecting grace and free-will. Shortly before 415 A.D., he went to Massilia (Marseille), where he founded two monasteries according to the rules laid down in his *De Institutis Cœnobiiorum*. One of these monasteries was for nuns. The other was the famous abbey of St. Victor, which under C. is said to have possessed not less than 5,000 inmates, and which served as a model to a multitude of monastic institutions in Gaul and Spain. His *Collationes Patrum Sceti-*

corum, is a work in 24 chapters, each of which gives a "spiritual colloquy between monks in the desert of Sketis," regarding the monastic life, and the vexed questions of theology. C.'s Grecian erudition, his dislike of dogmatic subtleties, and his zeal for monastic habits, led him to oppose the doctrine of St. Augustine on works and grace, and to set up a doctrine which was known by the schoolmen as "semi-pelagianism." See PELAGIANISM. As C.'s doctrine gained support from the Massilian monks, St. Augustine, having been informed of it by his friend Prosper of Aquitaine, wrote strongly against it, especially in his treatise *De Gratia et Libero Arbitrio, contra Collatorem*. It is not known when C. died; but it must have been subsequent to 433 A.D. The first collected edition of the various works attributed to him was published at Basel in 1559; the best at Frankfort, in 1722. The best account of his life and writings is by Wiggers, *De Johanni C.* (Rostock, 1824-25).

CASSIDAN, *Cassicus*, a genus of birds allied to starlings, having an exactly conical bill, thick at the base, and extremely sharp pointed, the commissure forming an angulated line, the bill ascending on the forehead, and encroaching circularly on the plumage. They are all American birds of gregarious habits, feeding both on fruits and insects, and "exhibiting such surprising skill and ingenuity in the structure of their nests, that an old lady once gravely asked an American ornithologist whether he did not think they might be taught to darn stockings!" The crested C., or crested oriole (*C. cristatus*), is a native of Brazil, Guiana, and Paraguay. It is about 20 in. long, is sometimes seen in flocks of 50 or 100, and constructs its nest by knitting together shreds of a thin bark, *tillandsias*, etc. The nest is about 36 in. long, and resembles a purse or pouch, the lower end hemispherical, and 10 in. wide, and is suspended from the extremity of a branch of a tall smooth-stemmed tree on the outskirts of a forest, apparently to insure safety from monkeys and serpents. Several of these nests are often to be seen hanging from the branches of the same tree.

CASSIDARIA, a genus of mollusks—class *gasteropoda* (q.v.), order *pectinibranchiata*—with univalve shells, generally regarded as belonging to the family *buccinidae* or *wheelks* (q.v.), but is forming a connecting link with the family *muricidae* (see MUREX). The shell is ventricose, with a moderately elevated spire, the aperture elongated, and the canal recurved, but not very abruptly—much less so than in the nearly allied genus *cassas*—the columellar lip covered with a plate, and the outer lip similarly margined within. The recent species, which are not numerous, belong to tropical and subtropical seas. Fifty fossil species have been described. The genus first appears in the upper cretaceous measures, where a single species occurs. In the eocene 11 have been found, and about 40 in the pliocene.

CASSIMERE (Fr. *casimir*, probably derived from *cashmere*), a thin twilled cloth, about thirty inches in width, either plain or figured, of wool, or wool and cotton, and much used in the manufacture of men's garments. Cassimere is manufactured chiefly on the continent of Europe, and to some extent also in England and in the United States. Cassimere was formerly known as *kersey* or *kerseymere* (q.v.), a name which is itself a corruption of *Cassimere*.

CASSIN, JOHN, 1813-69; b. Penn.; except a few years in business, he devoted most of his life to ornithology, and published many works thereon, among which are *Birds of California*; *American Ornithology*; *Mammalogy and Ornithology of the U. S. Exploring Expedition*; *Ornithology of the Japan Exploring Expedition*; *Ornithology of Gulliss's Astronomical Expedition to Chili*; a portion of the *Ornithology of the Pacific Railroad Explorations and Surveys*; and the ornithology of the *Iconographic Encyclopadia*. He was grand-nephew of Commodore John Cassin, and nephew of Commodore Stephen Cassin, both of the U. S. navy.

CASSINI, the name of a family distinguished by their services in astronomy and geography.

CASSINI, GIOVANNI DOMENICO, was b. at Perinaldo, near Nice, on the 8th of June, 1625, and studied at the college of Jesuits, Genoa. In 1650 he was appointed to the astronomical chair in the university of Bologna. His first work related to the comet of 1652. He subsequently devoted himself to the determination of astronomical refraction, and of the sun's parallax, etc. In 1664-65 he determined the period of Jupiter's rotation. Subsequently, he determined the periods of the planets Mars and Venus, as also of the apparent rotation of the sun. He it was who discovered the third and fifth satellites of Saturn, and afterwards the first and second, as well as the dual character of that planet's ring. He was also the first who carefully observed the zodiacal light; he demonstrated that the axis of the moon was not (as had been believed) at a right angle to the ecliptic, and explained the cause of the phenomenon known under the name of lunar libration. One of his finest observations was the coincidence of the nodes of the moon's equator and orbit. C. died Sept. 14, 1712, at Paris, whither he had gone in 1669, at the invitation of Colbert, to take charge of the observatory.

CASSINI, JACQUES, son of the preceding, was b. at Paris, Feb. 18, 1677. In 1694 he was elected a member of the academy of sciences. He traveled in Italy, Holland, and England, where he formed the acquaintance of Newton, Halley, Flamsteed, etc., and was elected a member of the royal society of London. On the death of his father, he succeeded to the charge of the observatory at Paris, and died April 16, 1756. C. wrote several treatises on electricity, the barometer, etc. In his treatise, *De la Grandeur et de la Figure de la Terre* (Par. 1720), he attempted to show that the earth must be a spheroid

elongated at the poles. The Newtonians denied this, inasmuch as it was opposed to the ascertained facts of gravitation and rotation, which necessitated the earth's being a spheroid flattened at the poles. As an observer, C. was eminently successful. He determined the periods of rotation of all the satellites of Saturn then known, the inclination of the planetary orbits, the obliquity of the ecliptic very nearly, and the length of the year, etc.—His son, **CÆSAR CASSINI**, was also engaged in scientific pursuits.

CASSINI, JEAN DOMINIQUE, Comte de, the son of Cæsar Cassini, was b. at Paris, June 30, 1748. He succeeded to the charge of the observatory, and completed in 1789 the great topographical map of France, begun by his father. But it having been decreed in 1793 that the observatory should no longer be in the hands of one person, three others were in consequence elected to the superintendence of it along with C., whose conduct on learning this fact showed that he had a greater regard for his own dignity than for the whole stellar universe. He refused to have anything more to do with astronomical science, and obstinately kept his purpose through a life that lasted nearly a century, and which was apparently so prolonged to test the durability of a Frenchman's disdain. In his 95th year he published a small volume of poems! He died Oct. 18, 1845.

CASSINO, a game at cards played by two or more persons. Four cards are dealt, one at a time, to each player, and four are turned face up on the table. After the hands are played the greatest number of cards counts the holder three, the greatest number of spades one, big C. (the ten of diamonds) two, little C. (the deuce of spades) one, and each ace one, so that eleven can be possibly counted by one person; the whole game is 21. The play is to take from the table as many cards as possible, preferring spades, or aces, or big or little Cassino. The cards are taken by the number of their spots; thus a ten will take a ten, or a nine and an ace, or four aces and a six, or any combination of spots that make just ten. Another part of the game is "building;" for example, a player puts a four on a six to make up ten, meaning to take both when it again comes his turn; but any one having a ten may take them before him; or if he builds a six, the next player may make it a nine, and the next still may put on an ace and call it ten; but in building, the one who makes any particular number must hold the card that will take it. Some persons make a progressive build; that is, if one has a nine and cannot at the time make a nine, he puts a four on a two and calls it six, having of course a three to make nine when it is next his turn to play. But this kind of building is generally ruled out as irregular. A modern variation of the game is now common, in which the knave counts eleven, the queen twelve, the king thirteen, the ace one or fourteen as the players may choose, and the "joker" fifteen. This plan greatly enlarges the number of combinations, and makes the game more intricate; as, for instance, an ace may possibly take three other aces, four deuces, and a tray, making fourteen spots; or the ace may take the big and little C. and two aces, which would make six points in the game.

CASSIODORUS, or (according to several MSS.) **CASSIODORIUS**, **MAGNUS AURELIUS**, a Latin writer, who distinguished himself by his erudition in an age of barbarism, was b. at Scylaceum (now Squillace), in Calabria, about 468 A.D. He was a member of a noble Roman family, and soon attracted the attention of Odoacer by his superior abilities and accomplishments. Under this monarch he held various offices, but after the defeat and murder of Odoacer by Theodoric the Ostrogoth, he passed into the service of the latter. The highest honors now fell upon him; and for years he administered the Ostrogothic power with remarkable prudence and success. In his 70th year, however, he withdrew to Calabria, where he founded the monastery of Viviers, and employed himself and the other monks in the invaluable work of copying classical MSS.; his great desire being to improve the education of the clergy. C. was about 100 years old when he died. Besides his grammatical and rhetorical manuals, which were used as text-books during the middle ages, he wrote a very important work, entitled *Variarum Epistolarum Libri XII*. This is a collection of state-papers, and is, in fact the most extensive as well as the most reliable source of information which we possess in regard to everything connected with the Ostrogothic rule in Italy. The style, however, is very peculiar, and shows the influence which the political career of C. had exercised on his language and modes of thought. The editio princeps of the *Variarum* was printed at Augsburg in 1533. See Hodgkin, *Letters of Cassiodorus* (1886).

CASSIOPEIA, the *lady in her chair*, a constellation in the northern hemisphere, near Cepheus, and not far from the n. pole. It is marked by five stars of the third magnitude, forming a figure like an M. A line from Capella to the bright star in Cygnus passes nearly through the middle of this M. C., according to Flamsteed, contains 55 stars, all of small magnitude. The figure is that of a woman sitting in a chair with a branch in her hand. In the year 1572, there all at once appeared in C. a new star. It was first noticed by Tycho Brahé on the 11th Nov., when its luster exceeded that of all the fixed stars, and nearly equaled that of Venus. The star gradually diminished in luster, from the time of its being observed until, in Mar., 1574, it disappeared. It is said to have alarmed all the astronomers of the age. Tycho Brahé wrote a treatise on it, and supposed—without good reasons—that it had previously appeared in 945 and

1264. Sir John Herschel suggested the possibility of its reappearance in 1872, but his suggestion was not verified.

CASSIQUIA'RE, or **CASSIQUIARI**, a river of Venezuela, South America, forming the a. bifurcation of the Orinoco, which it leaves in lat. $3^{\circ} 10' \text{ n.}$, long. $66^{\circ} 20' \text{ w.}$, and after a rapid s.w. course of about 130 m., joins the Rio Negro in lat. $2^{\circ} 5' \text{ n.}$, long. $67^{\circ} 40' \text{ west.}$ About 100 yards in breadth when it issues from the Orinoco, it gradually increases until at its union with the Rio Negro it attains a width of 600 yards. By means of this singular river, water-communication is established, through the Amazon, Orinoco, and their affluents, between the interior of Brazil and the Caraccas in Venezuela.

CAS SIS (Fr., the black currant-tree), a French liqueur prepared from black currants; the manufacture has recently become of great importance. See **CURRENT**.

CASSITE RIDES. See **SCILLY ISLES**.

CAS'SITERITE, the common ore of tin, the only source of the metal; found in Banca (an island in the Malay archipelago), in Cornwall (England), Spain, Sweden, France, California, and Chili. It consists of 78.38 tin, and 21.62 oxygen; it is found in mass, in fibres, in rolled flakes, and in grains.

CAS'SIUS LONGINUS, **CAIUS**, one of Cæsar's assassins. At the breaking out of the civil war, though a tribune of the plebs, he sided with Pompey and the aristocratic faction against Cæsar. He was taken prisoner by the latter, who pardoned him, and even made him one of his legates. In 44 B.C., through the influence of Cæsar, he was made *prætor peregrinus*, and was promised the governorship of Syria in the following year. But his mean and jealous spirit could not endure the burden of gratitude imposed upon him by the generosity of the dictator, and he resolved to be released by the murder of his benefactor. Having attached to himself the mutinous spirits among the subjugated aristocracy, and also won over M. Brutus, the pseudo-patriotic conspiracy was soon matured, and on the 15th of Mar., 44 B.C., Cæsar fell by the daggers of assassins. The result of this bloody deed was not what C. had expected. The popular feeling—as witnessed by the riots that broke out at Cæsar's funeral—was strongly against the murderers; and the military power fell into the hands of Mark Antony. C. therefore fled to the east, and made himself master of Syria. Afterwards he united his forces with those of Brutus, and having greedily plundered Asia Minor, they crossed the Hellespont in the beginning of 43 B.C., marched through Thrace, and took up a superior position near Philippi, in Macedonia. Here they were attacked by Antony and Octavian. The division commanded by C. was totally routed, although, on the other hand, Brutus succeeded in repulsing the troops of Octavian. C., supposing that all was lost, compelled his freedman, Pindarus, to put him to death. C.'s wife, a half-sister of Brutus, survived him upwards of 60 years. She died in the reign of Tiberius, 22 A.D.

CASSIUS, **PURPLE OF**, is a coloring substance of very ancient use, which is prepared by adding a mixed solution of protochloride and bichloride of tin gradually to a solution of chloride of gold, when a more or less abundant precipitate of the double stannate of gold and tin, $\text{Au}_2\text{O} \cdot \text{SnO}_2 + \text{Sn}_2\text{O}_3 \cdot \text{SnO}_2(?)$, is thrown down. The purple of C. is soluble in ammonia, yielding a very pretty purple solution, from which it can again be obtained, with solid form unchanged, by evaporating the ammonia. Mixed with borax, or some fusible glass, purple of C. is employed by the potter to communicate a rich purple or rose tint to the better kinds of china, and it also imparts the red color to the kind of glass known as *Bohemian glass*.

CASSIUS PARMENSIS, or **CAIUS CASSIUS SEVERUS**, one of the conspirators against the life of Julius Cæsar. He was an adherent of his namesake Cassius, and fought on his side until their defeat at Philippi. Afterwards he adhered to Pompey, and finally supported Antony until the defeat at Actium. He went to Athens, but was arrested and executed about 30 B. C. by order of Augustus. He made some pretensions to poetry, but he was not the Cassius alluded to by Horace as noted for the abundance and the poverty of his compositions.

CASSIVELAU'NUS, a British chief, who fought against Cæsar during his second invasion of the island, 54 B.C. He ruled the country n. of the Thames, and had a great reputation as a warrior, but his capital was taken by the Romans, and he himself compelled to flee. He afterwards sued for peace, which he obtained, on condition of paying tribute and giving hostages.

CASSOCK, a long loose coat, formerly in common wear, but now usually worn only by the clergy. As worn by the clergy of the church of England it is a long coat with a single upright collar. Black is the common color for all orders of the clergy, but on state occasions bishops frequently wear purple cassocks. In the Roman Catholic church cassocks vary in color according to the dignity of the wearer—priests wearing black, bishops purple, cardinals scarlet, and the pope white.

CAS SOWARY, *Casuarus*, a genus of birds nearly allied to the ostrich (see **BREVI-PENNES** and **OSTRICH**), but distinctively characterized by still greater shortness of wing, by a laterally compressed bill, by a bony crest, by pendent wattles on the naked neck, and by three toes on each foot, all furnished with claws, the inner toe short, and armed

with a very long and sharp claw. There are also very important anatomical differences in its digestive organs, which are not adapted to the same coarse diet, for the C. "has short intestines and small coeca, wants the intermediate stomach between the crop and gizzard, and its cloaca does not proportionally exceed that of other birds." Only one species is known, *casuarius galeatus*, sometimes called emu by the older naturalists, before that name was appropriated to the Australian bird which now alone receives it. The C. is a native of the Moluccas, New Guinea, and other Asiatic islands, chiefly inhabiting deep forests. In general appearance, it is not unlike the ostrich, but has a much shorter neck. It is the largest known bird except the ostrich, and its height, when erect, is about 5 feet. It feeds on fruit, eggs, and succulent herbage. When attacked, it defends itself by kicking obliquely backwards with its feet, and by striking with its short wings, the rigid barbless shafts of which, although useless even to aid it in running, are not without value as weapons. There are only about five of them in each wing, somewhat resembling the quills of a porcupine; and at the end of the last joint of the wing there is a spur. The color of the C. is brownish black; the feathers are loosely webbed, and hang down, so that, at a little distance, the bird seems clothed with hair. Those of the rump are 14 in. long, hanging down in place of a tail. The head and upper part of the neck are naked and of a bluish color, and there are two pendent wattles, partly red and partly blue, on the front of the neck. On the breast is a callous bare part, on which the bird rests its body on the ground. The bony crest or helmet reaches from the base of the bill to the middle of the crown, and is about 3 in. high, exhibiting the most intense blue, purple, and scarlet blended together. The C. lays a few eggs, which it leaves to be hatched by the heat of the sun; and which are greenish, and have a much thinner shell than those of the ostrich. Its flesh is black, tough, and juiceless. The C. is not unfrequently to be seen in menageries in Europe, but is becoming more rare in its native regions, in which it is sometimes kept tame. See *illus., OSTRICH, ETC., vol. XI.*

CAST, an impression produced by pouring a ductile substance, such as plaster of Paris, into a mold. This method was employed by the ancients in multiplying not only objects of art, such as the small household statues of the gods, but articles of direct utility. The so-called *Celts*, or chisels of bronze, which, with the molds for casting them, are found in England, Ireland, and France, testify to the fact that the art of casting from a mold is one of the earliest acquired by semi-civilized nations. Casts are of incalculable value in familiarizing the eyes of those who can never look on the originals with the grand and beautiful forms of antique art. Casting, when applied to metals, is called *founding* (q.v.).

CASTAGNO, ANDREA DEL, 1390-1457; a painter of the Florentine school, who imitated the naturalists of the time in boldness of attitude, but was deficient in grace and coloring. For several centuries, C. rested under the imputation of having murdered his colleague, Domenico Veneziano, in order to monopolize the then recent secret of oil painting as practiced in Flanders by the Van Eycks; but the charge has been proved untrue, as Domenico outlived C. by four years. One of C.'s extant works is an equestrian figure in the Florentine cathedral.

CASTALIA, a fountain on the slope of Parnassus, a little above Delphi, in Phocis, sacred to Apollo and the Muses. It was the "holy-water" of the Delphian temple; and all who came to consult the oracle, or visited the place with any religious purpose whatever, were wont to bathe their hair *in puro Castalia* (in the pure dew of C.), but those who wished to be purified from murder bathed their whole body. The Roman poets feigned that its waters filled the mind of those who drank of it with poetic inspiration. It was imagined to have some connection with the river Cephissus, and to flow from the subterranean Styx. The fountain, whose waters are still pure and delightful as in the days of classical antiquity, now bears the name of St. John, from a small chapel of that name close by.

CAS'TANETS, a musical instrument of percussion in the form of two hollow nut-shells, which are bound together by a band fastened on the thumb, and struck by the fingers to produce a trilling sound in keeping with the rhythm of the music. The *krotalon* of the ancients was somewhat similar. The C. were introduced into Spain by the Moors, where they retain the name of *castanulas*, from their resemblance to the form of the chestnut. The C. are now much used in the ballet and in the opera.

CASTANEA. See CHESTNUT.

CASTAÑOS, DON FRANCISCO XAVIER DE, Duke of Baylen, a celebrated Spanish general, was b. at Madrid in 1756, and studied in Germany the military tactics of Frederick the great. For some time after his return to Spain, he had no opportunity of acquiring distinction; but when Napoleon I. invaded that country, C. received the command of a division of the Spanish army, and on the 22d of July, 1808, compelled 20,000 French, under gen. Dupont, to surrender at Baylen. It is asserted, however, that the merit of this prodigious success belonged more to Aloys Reding, a Swiss by birth, and the second in command. In Nov. of the same year, C. was in turn defeated by the French at Tudela. The arrival of Wellington necessarily reduced him to a subordinate position, but he took part in the important battles of Albuera, Salamanca, and Vittoria. In 1811,

he was appointed general of the 4th Spanish *corps d'armée*, and commandant of several provinces. In 1815, he was placed at the head of 80,000 troops, destined to invade France, some of which had already crossed the frontier when the news came of the battle of Waterloo. Although no great favorite with the court politicians, his talents could not be overlooked. In 1825, he was called to the state council, where he became a decided opponent of the Carlist party. He died 24th Sept., 1852, at the advanced age of 96.

CAST—CASTING-LINE. The casting-line, in angling, is a gut-line on which the artificial flies are fastened. It is made up of several lengths of gut, knotted together, and, usually from 2 to 4 yards long. The flies are attached at intervals of about 2 ft., and the line with its flies is called a *cast*. The term *cast* is also applied to a part of a stream where certain fish may be taken, as a trout-cast, a salmon-cast.

CASTE, a term applied chiefly to distinct classes or sections of society in India, and, in a modified sense, to social distinctions of an exclusive nature among the nations of the west. When, at the end of the 15th c., the Portuguese began to penetrate to India by the cape of Good Hope, and to trade with the Deccan or southern portion of the Indian peninsula, they found arbitrary social laws, full of intricate regulations which constantly interfered with their intercourse with the natives, especially in matters involving the *subdivision of labor*. They found certain pursuits invariably followed by a certain class, and any attempt to induce a man to perform offices not appointed for the class of which he was a member, met with violent opposition, though such offices might, according to European notions, be more honorable than many he was content to fulfill. They observed, also, that these different classes often varied in appearance, the result, in some cases, of their addiction for many generations to the same pursuits; in others, of their having actually arisen from a different stock. Hence they applied to these various divisions of society the term *casta*—a Portuguese and Spanish word, meaning a breed. As applied to these classes of Hindu society, the word has passed into most European languages. From its frequent use in India, it has sometimes been erroneously considered of Hindu origin.* Of late, it has been spelled *caste*, but by old authors *cast*; and it is even a question whether the word may not be as genuine English, as *casta* is Spanish.

In the s. of India, the Portuguese became acquainted with what is considered the most exaggerated evil of caste. There are found there large numbers of a class called *pariahs*, or, in other districts of India, *chandalas*. They are probably the relics of some early conquered race, who have been degraded by uninterrupted ages of oppression, as is represented to have been the case with the Helots of Sparta, and people in a similar condition. These pariahs were always identified with outcasts—i.e., persons who had forfeited the privileges of their original order. No one of any C. would have any communication with them. If one of them even touched a Nayr, or warrior of high C., he might with impunity kill him. Some sorts of food were defiled by even their shadow passing over them; and the name of Pariah or Chandala conveyed to the Hindu the idea of the utmost vileness and disgust. All who violated the institutions of their class were held to sink into this class—a condition which involved the loss of all human respectability and comfort. These regulations were, moreover, referred to religion.

As India was at this time the land of the marvelous, and its inhabitants, though as various as the different nations of Europe, viewed as one homogeneous people, what was only true of one portion of the peninsula, was considered as prevailing everywhere, and as identical with the divisions of the Indians into *seven* tribes or castes, mentioned in olden times by Strabo, by Diodorus Siculus, and by Arrian. Nor was it forgotten that the Egyptians, whose early civilization was as undoubted as that of India, were also divided, according to Herodotus, into seven classes of priests, warriors, herdsmen, swineherds, tradesmen, interpreters, and pilots, to each of which were assigned particular districts.

About the middle of the 16th c., however, Abraham Roger, chaplain of the Dutch factory at Pulicat, gained the confidence of a Brahman, acquainted with the Sanscrit language, and by this means learned pretty exactly the account of the origin of C. given in the *Laws of Manu*, a work inferred to have been written not later than 900 B.C., which was long known only by name in Europe, until about the end of the last century, when a copy was obtained, and translated by sir William Jones. The whole of the Hindus are represented by Manu as divided into four classes:

1. The *Brahmans*, or *sacerdotal class*, who are said, at the moment of creation, to have issued from the *mouth* of Brahma. Their business is reading and teaching the Vedas, and the performance of sacrifice for themselves and others. They are to be the chief of all created beings; the rest of mortals enjoy life through them. By their imprecations, they can destroy kings, with all their troops, and elephants, and pomps. Indra, when cursed by one of them, was hurled from his own heaven, and compelled to animate a cat. Hence, the Brahman is to be treated with the most profound respect, even by kings. His life and person are protected by the severest laws in this world, and the most tremendous denunciations for the next. His own offenses are treated with singular lenity; all offenses against him, with terrible severity. He is forbidden

* In Sanscrit, *castes* are called *varnas*, i.e., "colors;" color being, no doubt, the chief distinction at first.

to live by service, but on alms; and it is incumbent upon virtuous men and kings to support him with liberality; and all ceremonies of religion involve feasts and presents to him. The first part of his life is to be devoted to an unremitting study of the Vedas—books, be it observed, older than the code of Menu, and yet, except, perhaps, one of the later hymns, containing no mention of C. as a religious ordinance. He is to perform servile offices for his preceptor, and beg from door to door. In the second quarter, he lives with his wife, reads and teaches the Vedas, assists at sacrifices, and, "clean and decent, his hair and beard clipped, his passions subdued, his mantle white, his body pure, with a staff and a copy of the Vedas in his hand, and bright golden rings in his ears," he leads a studious and decorous life. The third quarter of his life he must spend in the woods, as an anchorite, clad in bark, without fire, wholly silent, and feeding on roots and fruits. The last period he is released from external forms and mortifications, and is to spend his time meditating on the divinity, until at length he quits the body, "as a bird leaves the branch of a tree, at pleasure."

2. The *Kshatriya*, or *Chuttree*, or *military class*, sprang from the *arm* of Brahma, and bear something of a sacred character. It is stated that the sacerdotal order cannot prosper without the military, or the military without the sacerdotal; and the prosperity of both, as well in this world as in the next, is made to depend on their cordial union. The *Kshatriya* are to give alms, to sacrifice, to read the Vedas, and defend the people. Though Brahmans are to draw up and interpret laws, they are carefully excluded from administering them. The *executive* government is vested in the *Kshatriyas* alone.

3. The *Vaisya*, or *Bais*, or *mercantile class*, sprang from the *thigh* of Brahma. Their grand duties are to keep cattle, carry on trade, lend on interest, cultivate the soil, and turn their attention to every description of practical knowledge. They are to be perfect men of business.

4. The *Sudras*, or *Sooders*, or *servile class*, came from the *foot* of Brahma. They are to serve the three superior classes, more especially the Brahmans. Their condition is never to be improved; they are not to accumulate property, and are unable by any means to approach the dignity of the higher classes. Utter and entire submissiveness to the Brahmans is the spirit of all a Sudra's duties, and this is to be enforced by penalties as severe as they are ridiculous. Yet, withal, the Sudras were not to be slaves, either public or private, and to occupy a position much higher than the Chandalas.

Mixture of castes, though not absolutely forbidden, entails disadvantages on the children, and the offspring of a Brahmanical woman and a Sudra becomes a Chandala, or outcast.

Such—omitting the minute and childish laws and penalties, many hundreds in number, by which it is proposed to carry the principle of C. into the pettiest affairs of life—is a brief outline of it, as gathered from the code of Menu. There is no historical evidence that it ever existed in this form, and, from the nature of the case, we may conclude that it never did. In the *Toy-cart*, the oldest Hindu drama, no extravagant veneration for Brahmans anywhere appears. In fact, one of them is condemned to death; and the arrangements of society appear to have been the same as at present. The laws of C. form, it is true, a part of what is reputed to be Hindu law, but they have remained in all the states of India, Hindu as well as Mohammedan, to a great extent a dead-letter. There is nothing to show that the code of Menu was drawn up for the regulation of any particular state. Some have even conjectured that it may have been the work of some learned man, designed to set forth his idea of a perfect commonwealth under Hindu institutions, just as Plato in *The Republic* gives us his idea of a model government under Greek institutions.

Be this as it may, the C. which at present exists throughout the greater part of India is very different from that described in the code of Menu, though to this it owes, no doubt, much of its stability and its importance in the eyes of Europeans. With the exception of the Brahmans, the pure castes have disappeared, and out of the intermixture of the others have sprung innumerable classes, many of them unauthorized except by the people themselves. So ingrained in the whole community is this tendency to class distinctions, that Mussulmans, Jews, Parsees, and Christians fall, in some degree, into it; and even excommunicated or outcast Pariahs form castes among themselves. Most of the existing castes partake of the nature of associations for mutual support or familiar intercourse, and are dependent upon a man's trade, occupation, or profession. Many of them have been described by Mr. Colebrook in the *Asiatic Transactions*, vol. v. Many have had their origin in guilds, in schism from other castes, in the possession of a particular sort of property (as, for instance, landlords are spoken of as the C. of *zemindars*), and similar accidental circumstances. Their names are often due to the district in which the C. took its rise, to their founder, to their peculiar creed, or any random circumstance. In the Bengal presidency, there are many hundreds of such castes, almost every district containing some unknown in those adjacent. Among the lowest classes, and especially among the servants of the English at Calcutta, it has degenerated into a fastidious tenacity of the rights and privileges of station. For example, the man who sweeps your room will not take an empty cup from your hand; your groom will not mow a little grass; a coolie will carry any load, however offensive, upon his head, but even in a matter of life and death, would refuse to carry a man, for that is the business of another caste. Such and many other regulations are described in

every work on C., but are as unworthy of serious regard as are the assertions of self-importance found among little people all the world over. When an English servant pleads that such a thing "is not his place," his excuse is analogous to that of the Hindu servant when he pleads his caste. When an Englishman of birth or profession, which is held to confer gentility, refuses to associate with a tradesman or mechanic—or when members of a secret order exclude all others from their meetings—or when any other similar social distinction arises, it would present itself to the mind of the Hindu as a regulation of caste.

Nor does C., at the present day, *tie a man down to follow his father's business*, except, perhaps, in the case of the more sacred functions of the Brahmans. For the rest, Brahmans serve as soldiers, and even as cooks. Men of all castes have risen to power, just as in England our statesmen have sprung from every class of society. Nor, again, is loss of C. anything so terrible as has been represented; in most cases, it may be recovered by a frugal repast given to the members of the C.; or the outcast joins another C., among whom he will commonly be received with the heartiness due to a new convert. The question of the restoration of a Christian convert wishing to rejoin the Brahmanical C., has been differently decided by his fellow caste-men in different places.

As in the west, so in the east, C. enters into all the most ordinary relations of life, producing laws often most tyrannical and too anomalous to admit of generalization. In the west, however, whilst good sense and Christianity have ever tended to ameliorate social differences, the feeble mind of the Hindu and the records of his religion have had a contrary effect.

These modified views of C., which have begun to prevail in recent years, will be found more fully developed in *Shore On Indian Affairs*, Irving's *Theory and Practice of Caste*. Full accounts of the petty regulations of C., as laid down in the code of Menu, may be seen in sir William Jones's *Translation of the Code of Manu*, Robertson's *Disquisition on India*, Richard's *India*, Elphinstone's *History of India*, Dubois's *India*, Colebrooke's *Asiatic Transactions*, vol. v., and in various articles in the *Calcutta Review*. The most authoritative account of the subject of caste is to be found in the first volume of Dr. John Muir's *Original Sanscrit Texts on the Origin and Progress of the Religion and Institutions on India; collected, translated into English, and illustrated by Notes* (5 vols., Lond. 1867-71; vols. 1 to 4, new ed.), a work of the utmost value.

The question how C. is to be dealt with in converts to Christianity, has now been determined by common consent of missionaries in India; and it receives no recognition within the Christian church. An opposite policy, in former times, founded on the opinion that C. might be regarded as merely a civil or social institution, and not as a part of the religion of the Hindus, is now believed to have been among the principal causes of the comparative decay of the churches or congregations founded during the 18th c. in the s. of India.

CASTEGGIO, or **MONTEBELLO**, a t. of Piedmont, northern Italy, 5 m. e.n.e. of Voghera. In the campaign of 1859, C. was occupied by Austrians prior to the battle of Montebello, in which they were defeated by the French and Sardinians. C. was also valorously but unsuccessfully defended by the Austrians in the great battle of Montebello between them and the army of Napoleon I. in 1800. As *Clastidium*, C. was an important military position as early as the times of the Gallic and Punic wars. Some Roman antiquities still remain, and numerous curious inscriptions and coins have been found. Pop. about 4000.

CASTEL' (from the Latin *Castellum*) is a name prefixed to various places in Italy, France, Spain, Portugal, etc., of which the most important are:

1. **CASTEL-ARQUATO**, a t. of Parma, n. Italy, 19 m. s.e. of Piacenza, picturesquely situated amid forests and vineyards, with a fine Gothic church and a noble old castle, from which the town derives its name. It has manufactures of silk, and a pop. of 4,400.

2. **CASTEL-BOLOGNESE**, a t. of n. Italy, about 22 m. w.s.w. from Ravenna. It derives its name from a strong fortress built here by the Bolognese in the 14th c.; and is historically famous as the scene of a decisive battle between the Milanese and Florentines in 1434, in which the latter were completely vanquished.

3. **CASTEL-BUONO**, a t. of Sicily, in the province of Palermo, 8 m. s.e. of Cefalu. It is noted for its mineral springs, and has a trade in manna. Pop. 5,288.

4. **CASTEL-FRANCO**, a t. of central Italy, 8 m. e. of Modena, with the old walls and ramparts of a castle built by Urban VIII., and near the site of the battle between the consuls Hirtius and Pansa and Mark Antony.—Also the name of a town of Italy, in the government of Venice, about 25 m. n.w. from the city of that name, with linen and woollen manufactures, and a pop. of 4,220.

5. **CASTEL-GANDOLFO**, a village of the former Papal states, 11 m. s.e. of Rome, near the w. shore of lake Albano. Its situation is extremely picturesque, and it commands extensive views of some of the most beautiful scenery in Italy. The pope has his summer residence here. In early times, the noble family of the Savelli had a stronghold at C., by means of which, for a period of nearly 400 years, they bade defiance to popes, barons, and *bourgeoisie*. Pop. 1,994.

6. **CASTEL-SARDO** (formerly *C. Aragonese*), a fortified t. and seaport, the strongest

on the island of Sardinia, is situated on a steep rock on the n. coast, 16 m. n.e. of Sassari. The environs produce wine. Pop. 2,076.

7. **CASTEL-SARRASIN**, a t. of France, in the department of Tarn et Garonne, on the Songuine, 12 m. w. from Montauban. It has the remains of an old castle said to be of Saracenic origin, a pop. in 1876 of 3,547, manufactures of serge and worsted stockings, and a trade in the agricultural produce of the district.

8. **CASTEL-TERMINI** (ancient *Camicianæ Aquæ*), a t. of Sicily, in the province of Girgenti, and 16 m. n. from the city of that name. It has extensive mines of rock-salt and sulphur, and a pop. of 9,321.

9. **CASTEL-VETRANO**, a t. of Sicily, in the province of Trapani, 20 m. s.e. of the town of that name. It is an interesting place, with an old castle, several convents, manufactures of articles of coral and alabaster, and a pop. in 1881 of 20,053. Some of the most esteemed white wine of Sicily is produced in the vicinity.

CASTELAR', EMILIO, b. 1832; an author, statesman, and president of the Spanish republic. He was the son of a broker, and at the death of his father was left in poverty, but managed to secure a good education. He came before the public as a writer of novels, more prominently as an advanced liberal in politics. In 1856, he obtained the professorship of history in the university of Madrid, but lost the place in 1864, in consequence of joining Carrasen in the establishment of *La Democracia*, a radical journal. The paper was suppressed in 1866, and C. was sentenced to death for participation in the disturbance of June in that year; but he escaped to Switzerland, and subsequently went to France. At the beginning of the revolution in 1868 he went back to Spain and resumed his professorship, and in 1869 was one of the few republicans returned to the Cortes. In that body he advocated republicanism and vigorously opposed the prospect of a regency. In the government chosen by the Cortes after the abdication of Amadeo C. was made minister of foreign affairs. In Aug., 1873, he was elected president of the Cortes, but vacated the post when, Sept. 6, he was nominated for president of the executive power. His first act was to prorogue the Cortes and assume complete authority. He made energetic but ineffectual efforts to suppress the Carlists, and sent the minister of war to Cuba, in person, to protect Spanish interests in that island. When the Cortes re-assembled, Jan. 2, 1874, a vote of confidence in president C. was defeated, and he at once resigned. Thereupon, Pavia, as capt.gen. of Madrid, forcibly dissolved the Cortes and appointed a provisional government with Marshal Serrano at its head. Soon after the pronouncement in favor of Alphonso XII., Dec. 13, 1874, C. went to Switzerland, whence in Mar. 1875, he sent back his resignation of the chair of history in the university of Madrid. Among his writings are novels, poems, works on politics, slavery, the war in Africa, *Old Rome and New Italy* (translated into English), a life of Columbus also translated into English (1892), parliamentary discourses, etc. In 1893 he announced his retirement from public life, and declared the monarchy to be the only stable form of government possible in Spain.

CASTELL, EDMUND, 1606-85; an English orientalist who spent 18 years in compiling a lexicon of Hebrew, Chaldee, Syrian, Samaritan, Ethiopic, Arabic, and Persian. He spent from 16 to 18 hours a day on the work, and had 14 assistants. The outlay was \$60,000, which reduced him to poverty, but his losses were in part compensated by a number of preferments, among them that of prebend of Canterbury. C. assisted Dr. Walter in the preparation of the polyglot Bible.

CASTELLAMMARE, a fortified city and seaport of s. Italy, about 17 m. s.e. of the city of Naples. It is built on the lower slopes of Monte d'Auro, and along a sheltered beach on the s.e. side of the gulf of Naples, over which it commands a magnificent view. It is on or near the site of the ancient *Stabie*, which was desolated by Sylla during the social war, and where the elder Pliny afterwards lost his wife when the city was overwhelmed with lava from Vesuvius. Some ancient remains have been found here. The town was sacked in the 15th c. by pope Pius II., and again in the 17th c. by the duc de Guise. It has a royal palace, a cathedral, several convents, among which that founded by Gonsalvo de Cordova, in the 16th c., is famous for the possession of an image of the Madonna found in a well in the 11th c., which is greatly venerated by the peasantry, who make an annual pilgrimage to the church. The old castle, which gave name to the town, was built in the 12th century. C. has a royal dockyard, affording employment to many of the inhabitants, and manufactures of linen, silk, cotton, leather, and sail-cloth. Pop. 27,000.—**CASTELLAMARE** is also the name of a town in Sicily, situated at the head of a gulf of the same name, and 20 m. e. from Trapani. It has a population of 14,000, and exports of cotton, wine, fruit, and manna.—**C.**, **GULF OF**, is an extensive bay on the n. coast of Sicily. Its width from e. to w., between point Uomo Morto and cape St. Vito, is about 15 m.

CASTELLAMONTE, a t. of n. Italy, in the province of Turin, 10 m. s.w. of Ivrea. It has an old castle, manufactures of earthenware, and a trade in the agricultural produce of the district. Pop. 6000.

CASTELLAN, or **CHÂTELAIN**, the keeper of a castle or *burg* in the middle ages. The office and the rank of the C. were various in various countries. In France and Flanders, the title C. belonged to the holders of certain demesnes, and was next in order of rank to that of a bailiff. In Germany, the C. had the jurisdiction of a burg-graf during the

ages of chivalry. In Poland, the title of C., with its appendages, remained in later times, and, after the 16th c., the castellans, with the waiwodes and bishops, formed the senate or superior legislative chamber.

CASTELLA NA, a t. of s. Italy, in the province of Bari, and 26 m. s.e. of the city of that name. Its trade is confined to the produce of the district. Pop. 10,000.

CASTELLANETA, a t. of s. Italy, in the province of Lecce, 20 m. n.w. of Taranto. It has a cathedral and several convents. Cotton is grown in the district. Pop. 9,000.

CASTELLAZZO, a t. of n. Italy, about 5 m. s.w. of Alessandria. Pop. 6000.

CASTELLEONÉ, a t. of Lombardy, n. Italy, situated near the Oglio, about 12 m. n.n.w. of Cremona. It is surrounded by old walls, has a fine church, and a population of 6,000.

CASTELLIO, or **CASTALIO**, SEBASTIANUS, a theologian, b. in Dauphiné in 1515. His proper name was *Châteillon*, which he Latinized, according to the usage of his time. About 1540, he was invited to Geneva, by Calvin, and appointed humanity professor; but having the misfortune, afterwards, to differ from the reformer in religious opinion, he was banished from the city, and went to Basel, where he spent the rest of his life in great poverty. Died in 1563. See CALVIN.

Among his various writings may be mentioned *De Hæreticis*, etc.—a treatise which argues against the right of the magistrate to punish heretical opinions, and which produced a reply from Beza; a Latin version of the Old and New Testaments, published in 1551, and dedicated to Edward VI. of England; and a posthumous work, in dialogue, on predestination, election, free-will, and faith, first published by Faustus Socinus in 1578.

CASTEL'LO, GIOVANNI BATTISTA, 1500-70; an Italian historical painter of the Genoese school. His best known works are the "Martyrdom of St. Sebastian," and "Our Saviour as Judge of the World." He was also an architect and sculptor.

CASTEL'LO, VALERIO, 1625-59; a son of Giovanni Battista, who excelled his father in painting, especially in cattle scenes. He decorated the cupola of the church of the Annunciation, in Genoa, and painted the "Rape of the Sabines," in the Brignole palace in that city.

CASTELLON', a province in e. Spain, on the Mediterranean, 2447 sq.m.; pop. '87 292,437. It is a rough and mountainous region, containing many mines, and mineral springs. A railroad runs through the province parallel with, and not far from, the sea. The chief town is Castellon de la Plana, near the Mediterranean, 40 m. n.n.e. of Valencia, with which there is railroad connection.

CASTELLON DE LA PLANA, a t. of Spain, capital of the province of the same name, is situated in the midst of a fruitful plain, about 4 m. from the Mediterranean, and 40 m. n.n.e. of Valencia. A magnificent aqueduct supplies the means of irrigation. C. is surrounded by walls, and is for the most part well built. It has some handsome old churches, and a singular bell-tower, 260 ft. high. Ribalta, the celebrated Spanish painter, was a native of Castellon de la Plana. It has manufactures of linen, woolen, sail-cloth, paper, earthenware, and fire-arms; also brandy distilleries, and an active trade. Pop. 25,193.

CASTELNAU', FRANCIS, Count, 1812-80; b. London, England; traveled through North America 1837-41; was chief of a French government scientific expedition to South America 1841-7; held several consulships; and published *Expédition dans les parties centrales de l'Amérique du Sud* (1850-1).

CASTELNAU', MICHEL DE, SIEUR DE LA MAUVISSIÈRE, 1520-92; a French soldier, and ambassador to the court of queen Elizabeth. He was thoroughly educated, traveled much, and served in the French army in active service in Italy, where his courage and ability secured for him the friendship of the cardinal of Lorraine, who took him into his service. In 1557 he was given a command in the navy, but soon rejoined the French army in Picardy. He executed several delicate diplomatic commissions so satisfactorily to the constable de Montmorency that he was sent by the king to Henry II. of Scotland with dispatches for Mary Stuart, who was then betrothed to the Dauphin (afterwards Francis II.). He went also to England and treated with Elizabeth respecting her claims in Calais, a settlement of which was made at the congress of Cambray. After the death of Francis II. he accompanied the queen (Mary Stuart) to Scotland, remaining a year, during which time he made several journeys to England and attempted to bring about a reconciliation between Mary and Elizabeth, but his wise and temperate counsels were disregarded. In 1562 he retired to France in consequence of the civil war, and was employed against the Protestants of Brittany. He served at the siege of Rouen and at the battle of Dreux, took possession of Tankerville, and contributed in 1563 to the recapture of Havre from the English. Within the next ten years he was employed in a number of important missions; first to queen Elizabeth to negotiate a peace; next to the duke of Alva, the new governor of the Netherlands, on which occasion he discovered the project formed by Condé and Coligny to seize and carry off the royal family (1567). After the battle of St. Denis he was again sent to Germany to solicit aid against the Protestants, and on his return was made governor of St. Dizier. In 1572, he was sent to England by Charles IX. to allay the excite-

ment caused by the massacre of St. Bartholomew, and in the same year was sent to Germany and Switzerland. Two years later he was sent by Henry III. as ambassador to queen Elizabeth's court, where he remained ten years. While on this duty, with a view of strengthening and maintaining the alliance between the two countries he used his influence to procure the marriage of Elizabeth with the duke of Alençon; but Elizabeth made so many promises, only to break them, that C. at last refused to transmit them to his government. On returning to France he was out of favor with the league, lost his governorship of St. Dizier, and was reduced to extreme destitution; but on the accession of Henry IV. he was, though a Roman Catholic, intrusted with many important missions. The memoirs of C. are valuable for their accuracy and impartiality.

CASTELNAUDARY, a t. in the department of Aude, France, situated on a declivity, skirted at the base by the canal du Midi, 22 m. from Carcassone. Pop. '91, 10,059. It has manufactures of woolen and silk fabrics, and earthenware, and carries on a lively trade in agricultural produce. The canal at this point expands into a large basin, which serves as a haven. It suffered dreadfully in the crusade against the Albigenses, and was, in 1212, the scene of a battle between Simon de Montfort and Raymond, count of Toulouse. In 1355, it was captured by the black prince. In 1632, marshal Schomberg here gained a victory over the party of the duke of Orleans, when the brave duke of Montmorency was taken prisoner, and afterwards executed at Toulouse.

CASTELNUOVO, a seaport t. of Dalmatia, Austria, situated near the w. entrance of the gulf of Cattaro. It is surrounded by walls, and defended by two forts and a citadel. It has manufactures of brass, and a trade in the produce of the district, which is fertile. It was captured by the British in 1814. Pop., about 2000.

CASTI, GIOVANNI BATTISTA, 1721-1803; an Italian poet of humble origin, who rose to the dignity of a canon in the church, but preferred, to further preferment, a life of travel to the gay cities of Europe. In 1782, on the death of Metastasio, he was appointed poet-laureate of Austria, in which position he devoted himself to comic operas. His best known work is *Gli Annimati Parlanti*, freely used in W. S. Rose's *Court and Parliament of Beasts*. On the whole, his poems are harmonious and pure in style, lively and sarcastic, but without originality of plot, and often grossly licentious.

CASTIGLIONE, a t. of Sicily, province of Catania, on the n. slope of Mt. Etna, on the right bank of the Cantara, 35 m. s.w. of Messina. The town stands on a square rock rising abruptly from the valley, and having a double crest, on which stand a domed church and the ruins of a feudal castle. Here, in 1297, in the war of the Vespers, admiral Roger Toria raised the standard of rebellion against his sovereign, Frederick of Aragon. In the district are several large nut-plantations, which produce the best Sicilian hazel-nuts. Pop. 8,000.

CASTIGLIONE, a village on the site of the old city of Gabii, in Italy, 10 m. e. of Rome. The place is noted for ruins of a temple to Juno, a theater, the ancient walls, and other relics of the past.

CASTIGLIONE, LAKE OF, a lagoon of central Italy, in the province of Siena. It lies n. of Grosseto, and has a length of about 10 m., with a breadth of from 1 to 3 miles. Receiving the waters of the Bruna and other rivers, it discharges its waters, by a short canal, into the Mediterranean.

CASTIGLIONE, BALDASARE, Count, one of the most elegant of the old Italian writers, was b., 1478, at Casatico, in the duchy of Mantua, and studied at Milan. His shining talents, knowledge, and pleasing manners made him a favorite of Guidobaldo di Montefeltro, duke of Urbino, a great patron of literature, at whose court he was honorably entertained, along with other men of eminence in letters. He was employed by the duke as envoy to Henry VIII. of England, who made him a knight; and was afterwards sent in the same capacity to Louis XII. of France, under Guidobaldo's successor, in several important ambassadorial missions. He died at Toledo in 1529. His chief work is the book *Del Cortegiano*, a manual for courtiers, remarkable for its elegant style. His Italian and Latin poems are also models of elegance, and his *Letters* (2 vols., Padua, 1769-71) contain interesting contributions to the political and literary history of his time. Tasso devoted a sonnet to the death of C., and Giulio Romano raised to his memory a monument in Padua.

CASTIGLIONE, CARLO OTTAVIO, Count, an eminent Italian philologist, was b. at Milan in 1784. At an early period, he displayed a predilection for antiquarian studies, more particularly numismatics. When only 24 years of age, he published a description of the Kufic coins in the cabinet of Brera, at Milan, under the title, *Monete Cufiche del Museo di Milano* (Milan, 1819), which showed a great knowledge of oriental languages and history. C.'s principal work in the sphere of oriental literature is his *Mémoire géographique et numismatique sur la Partie orientale de la Barbarie appelée Afrikiah par les Arabes, suivi de Recherches sur les Berbères Atlantiques* (Milan, 1826), in which he seeks to ascertain the origin and the history of the towns in Barbary whose names are found on Arabic coins. Out of Italy, C. is perhaps best known by his edition of some fragments of the Mæso-Gothic translation of the Bible by Ulfilas (q.v.), which had been discovered, in 1817, by cardinal Mai among the palimpsests of the Ambrosian library. At

first, he published some specimens in conjunction with Mai, but in 1829, 1834, 1835, and 1839, appeared a variety of fragments of the Pauline epistles, edited by himself, and enriched with valuable disquisitions, commentaries, and glossaries. He died at Genoa, April 10, 1849.

CASTIGLIONE, GIOVANNI BENEDETTO, 1616-70; a Genoese painter who studied for some time under Vandyke. He excelled in depicting fairs, markets, and rural scenes, and painted portraits and historical pieces. He also made many etchings which were remarkable for light and shade. Among the most famous of his paintings was "The Nativity of Jesus," in the church of San Luca at Genoa. His brother Salvatore, and his son Francesco, excelled in similar subjects.

CASTIGLIONE, GIUSEPPE, 1698-1768; an Italian Jesuit missionary who labored many years in Peking and other parts of China. He was also an artist of ability, and it is said that the emperor Kien-Long erected several palaces from his designs.

CASTIGLIONE DEL LÉ STIVIERÉ, a t. of n. Italy, 23 m. n.w. of Mantua. It is walled and defended by an ancient castle; but is chiefly celebrated on account of the victory obtained here by the French over the Austrians in 1796, and which gave the title of duc de Castiglione to marshal Augereau. Pop. 5,000.

CASTILE (Spanish, CASTIL'LA) forms, in a geographical and political point of view, the central district of the Spanish peninsula, being the middle and most strongly marked plateau of Spain, as well as the central seat of the monarchy. Both geographically and politically it is divided into Old and New Castile—*Castilla la Vieja* and *Castilla la Nueva*. The former district, situated in 40° 5' to 43° 32' n. lat., and 1° 40' to 5° 35' w. long., rises, in the form of an elevated plateau, to the height of 2,500 to 3,000 feet. It is walled in on all sides: on the n., by the highest masses of the Cantabrian mountains, which separate it from the Basque provinces and Asturias; on the s., by the high ridge forming the water-shed between the Douro and the Tagus; while the Sierras de Oca, de Urbion, and Moncayo, and the heights of Leon and Tras-os-Montes bound it on the e. and west. The high plateau of Old C. is but scantily watered, and its natural characteristics far from inviting. In many parts, nothing is presented to the eye but a wide, unwooded, almost treeless waste of land, unrefreshed by streams, in some parts monotonously covered with stunted grasses, and in others almost destitute of vegetation. The traveler may walk many miles without finding a village, or even a solitary farm-house. All Old C., however, is not a dusty desert. There are rich tracts in it producing some of the finest wheat in the world. Madder and grasses are also produced abundantly in some parts; and even the olive flourishes where it is protected from the frost and snow of winter, and from the cold winds prevailing in Oct. and the following months. Iron and other minerals exist in plenty, but are not worked to any great extent. Sheep, cattle, pigs, and mules form the chief wealth of the inhabitants. Manufactures consist of coarse woolens, cotton, linen, leather, and glass.

The plateau of NEW CASTILE—which is situated between lat. 38° 23' and 41° 15' n., and long. 1° and 5° 25' w.—like Old C., is also inclosed by mountains. Though lying 1800 ft. lower than Old C., New C. presents many similar characteristics of soil and scenery. It is mostly sterile, and scantily irrigated; little rain falls, and the nightly dews are insufficient to refresh the plains, which are entirely destitute of trees, and, in summer, appear quite burned up. Olives, corn, pulse, and saffron are cultivated in some neighborhoods; but flocks of sheep constitute the chief wealth of extensive tracts of land. The commerce, carried on by means of long trains of mules, reminds the tourist of the caravan traffic over eastern deserts. Industry is almost entirely restricted to manufactures of coarse woolen goods. The yield of the salt-mines in the s. is, considerable; and quicksilver, especially at Almaden (q.v.), and iron (manufactured at Toledo) are plentiful. The Castilians have even more than the general haughtiness of the Spanish character. Their language prevails throughout the educated classes, as in the literature of Spain, and their rulers have extended their sway over the whole nation.

In the present administrative division of Spain into forty-nine provinces, the division of Old and New C., though it will long be remembered by the people, is one belonging to past history. Old C. is now divided into the eight provinces of Burgos, Logroño, Santander, Soria, Segovia, Avila, Palencia, and Valladolid. The population, distributed over an area of 25,400 sq.m., amounted, in 1887, to 1,717,402. New C. includes the five provinces—Madrid, Guadalajara, Cuenca, Toledo, and Ciudad Real, and on an area of 20,200 sq.m. had 1,487,712 inhabitants. Besides these provinces, the kingdom of Leon, Galicia, the principality of Asturias, and the districts of Estremadura, Andalusia, Granada, and Murcia, belonged to the crown of Castile.

C. first became an independent country in 762, and remained so until 1028, when it passed to Sancho III., king of Navarre. His son, Ferdinand I. (great), founded the kingdom of C., and among other acquisitions annexed to it the kingdom of Leon. This union, however, was not permanent, Leon being made a separate kingdom for Ferdinand II. The two kingdoms, however, were afterwards reunited in the 13th c. in the person of Ferdinand III., and remained ever after under one scepter. Among the successors of Ferdinand III., the most distinguished was Alfonso X., by whose direction the Alfonsine (astronomical) tables were drawn up. By the marriage of Isabella, sister and successor of Henry IV., with Ferdinand, king of Aragon (1469), the two crowns of C.

and Aragon became united (1479), and from these sprang the kingdom of Spain, which, however, was not fully established before the death of Ferdinand, in 1516, when Charles I. of Spain (Charles V. of Germany) inherited both crowns.

CASTIL'LA, DON RAMON, 1796-1867; a Peruvian who entered the Spanish army in 1816, but soon after 1820 joined the revolt against Spanish rule. In 1830, Gamarra made him chief of staff of the whole army, and the provisional president appointed him brig-gen. After the treaty with the president of Bolivia, Castilla went to Chili, and in 1837 joined the Peruvians who marched against Santa Cruz, the president of Bolivia. When the revolutionists proclaimed Gamarra president, Castilla was made minister of war. In 1841, he was one of the leaders of the Peruvian force that invaded Bolivia, and in 1845 he was elected president of Peru. His successor, Echenique, became unpopular, and Castilla started a revolution, overcame Echenique, and became sole ruler of the country. One of his important reforms was the abolition of slavery. In 1858, he was re-elected president, and in 1860, he proclaimed a new constitution which granted universal suffrage and prohibited the exercise of any religion except the Roman Catholic. His last political movement was in 1867, when he led an insurrection against Prado, then president; and he was on his way to Arica when he died.

CASTILLEJO, CHRISTOVAL DE, 1494-1556; a Spanish verse-writer of great fertility, whose poems were about the last of the old Spanish school before the changes led by Garcilaso de la Vega. Being strongly anti-clerical, Castillejo's writings were usually noted on the Index Expurgatorius, and were smuggled into Spain from foreign printing-houses, while in a later period the agents of the church altered the verses to suit themselves. The works of Castillejo are in three books, one entitled *Love*, one *Conversation and Pastime*, and the third comprising moral and religious verses. He died in a monastery.

CASTILLON, a t. of France, in the department of Gironde, situated on the right bank of the Dordogne, 26 m. e. of Bordeaux. It has manufactures of cotton and woolen yarns, nails, and cordage. It is celebrated as the scene of the battle between the forces of Henry VI. of England and Charles VII. of France, July, 1453, in which the English met with a signal defeat, their leader, the earl of Shrewsbury, and his son, being slain. Of all their possessions in France, Calais alone remained to the English after this battle, the incidents of which were seized on by Shakespeare for the sixth scene in his play of *King Henry VI.*, part 1. Pop. about 3000.

CASTINE, a town and port of entry in Hancock co., Me., on the Penobscot, 34 m. below Bangor. It was here that the baron de Castine settled in 1667 a French colony, which was soon abandoned in consequence of Indian and English wars. In 1760 it was reoccupied by the English, who made a harbor that was always accessible for the largest ships. Shipbuilding and fishing are the employments of the greater portion of the people, and it is the seat of the Eastern state normal school. Pop. '90, 987.

CASTING, in angling, is the term applied to the act of throwing a fly or a fish-bait. In casting a fly with a single-handed rod, the beginner should let out about as much line as the length of the rod; grasp the rod just above the reel; then wave it back over the right or left shoulder, with a slightly circular sweep, so as to extend the line behind; and then bring it forward with a steady cutting kind of action, urging the point of the rod towards the spot where the fly is to fall, taking care not to carry the point of the rod too far forward, or too low, or the line will not fall straight and evenly on the water. The object of the circular sweep behind is to prevent the fly from cracking off. By slightly raising the point of the rod just as the fly is delivered, the line is straightened; and the fly, checked in mid career, falls like thistle-down upon the water. Always allow time for the line to go straight out behind, for if returned too quickly, the fly cracks off. In casting with the double-handed rod, the one hand grasps the rod above the reel, and the other below it, the lower hand acting as a pivot upon which the rod turns.

In casting a bait, either for spinning, trolling, or live-baiting, the bait is suffered to hang from the point of the rod about a yard. Taking the rod in both hands, the line clasped to the rod in his right, the angler waves the bait gently back; and having first drawn as much line as he requires off the reel, and laid it loosely at his feet, he sends the bait forward with a swing towards the point he desires to reach.

CASTING. See **FOUNDING**.

CASTING-NET, a species of net very widely distributed, having been found in use amongst various savage tribes in different parts of the world, some of whom, from long and constant practice, use it with a dexterity and address unknown in America. The nets used in America are usually from 13 to 20 ft. in circumference when spread out. They are netted in the shape of a kind of long loose bag or cone; and so much is the number of meshes increased as the net progresses, that it is capable of being spread out in a perfectly flat and circular form, the apex of the cone forming the center of the circle. To this apex is attached a rope of some yards in length; when casting, this rope is fastened round the left wrist of the caster. The bottom of the net, which forms, when it is held up by the apex, the base of the cone, or, when spread, the circumference of the circle, is hung around with perforated leads or bullets. These have not only the effect of carrying the net to the bottom of the water, but also, when it is cast, of causing

the net to spread open. The bottom of the net is turned up some 6 in. or more in depth, and hung up on the inside about every 10 in. or so, to an upper portion of the net, by stout strings, so as to form a kind of purse; this is called the "tuck." When the net is required to be cast, the caster, having fastened the rope to his wrist, and coiled it loosely in his left hand, hangs a portion of the net over his left shoulder; and then gathering as much of the outer edge of the net as he can collect in his right hand, and holding it up so as to open the net as much as possible, makes a semicircular sweep of the body and the right hand—rather difficult to accomplish without practice—and whirls the net away off the shoulder. The centrifugal motion thus communicated to the leads, etc., on the bottom of the net, causes it to open like a circle on the surface of the water, the leads carry it to the bottom, and the net thus covers all that comes within its circle. The rope is then pulled gradually, and worked from side to side, in order to narrow the circle, to bring it once more into a cone; and, in their efforts to escape, the fish that may have been covered are gradually driven into the tuck or purse of the net. When the leads are all close together, the net is lifted from the water, and the fish in the tuck are taken out. The cost of a cast-net is regulated by the circumference and the size of the mesh.

CASTING-VOTE, the vote by which the chairman or president of a meeting is generally empowered to *cast* the balance on the one side or the other, where the other votes are equally divided. In the House of Commons, the Speaker does not vote at all unless this occurrence takes place. As his position in this respect is felt to be a delicate one for a person whose duty it is to withdraw himself from the contentions of party, it is usual for the speaker to vote in such a way as to give the house an opportunity of reconsidering its decision. The same rule prevails in our Congress. Following a similar rule, the chairman at corporation and general meetings usually gives his casting-vote either in a way that will lead to a reconsideration of the subject, or for what seems the popular view of the case, although that may be at variance with his convictions.

CAST-IRON, or **PIG-IRON**. This is the crudest form of iron, and the method of its production is described under the head **IRON**. There are two leading kinds of it, namely, white pig-iron and gray pig-iron; the former is also called *forge-iron*, from the fact of its being chiefly used for conversion into malleable iron and steel; and the latter is often called *foundry-iron*, on account of its suitability for castings. Of each of these, again, there are many varieties; and much light has of late years been thrown on what constitutes their different qualities, by experiments in the manufacture of steel. White cast-iron, when smelted from the argillaceous ores of the coal-measures, is of inferior value to the gray; much of it, indeed, being produced against the will of the iron-master, when the blast-furnace is working badly. But when obtained from pure ores and fuel it is the most valuable kind, because it contains fewer impurities, and has its carbon nearly all in the combined state, in which case it is best suited for the manufacture of wrought-iron and steel. Gray pig-iron contains carbon both in the combined and the uncombined (graphitic) state. In the grayest kind, uncombined carbon greatly prevails, and the fracture of the iron is more distinctly granular or scaly-crystalline than is the case with other varieties. Such cast-iron is usually called No. 1. It is much softer, but fuses at a higher temperature than white pig-iron. It also becomes thinly liquid when melted, and expands slightly just before cooling—properties which render it extremely valuable for castings. As the grayness and graphite-like brightness diminish, the iron is known as No. 2, No. 3, and so on for several numbers, till we come to the close texture and light color of white pig-iron; No. 2 being but slightly different from No. 1, and No. 5 from white-iron, in quality. No. 3 is intermediate between the extremes. When cast-iron is partly gray and partly white, it is called mottled iron. Cast-iron contains from 2 to 5 per cent of carbon, the maximum amount in steel being 2; but steel is practically free from silicon, sulphur, and phosphorus, while cast-iron is not.

CASTLE (Sax. *castel*; Lat. *castellum*, dimin. from *castrum*), a building constructed for the purpose of repelling attack. The root of the word is the same as that of *casa*, a little house or hut, and probably means a driving off or repelling; and it is worthy of notice, in confirmation of this view, that in Welsh the radical syllable *cas* signifies a C., separated, and also hatred, malice, etc. The *castella*, left by the Romans in Britain and elsewhere, were constructed on the general model of their stationary encampments (*castra stativa*), (see **CAMP**); and though they may have suggested the castles of the Middle Ages, they differed from them in being designed for military purposes only, and not also as places of permanent residence. Even Burgh castle, in Suffolk, the ancient Garamonium, and Richborough castle, in Kent, the ancient Rutupæ, were encampments or fortresses, rather than castles.

Besides these monuments of the military occupation of the island by the Romans, traces are found in various parts of the country of encampments or castles, which are ascribed to its aboriginal or early inhabitants. These are generally situated on the tops of hills; as, for example, the Herefordshire beacon, on the Malvern hills; Moel Arthur, in Flintshire; Chem castle, in Cornwall; the Maiden castle, in Dorsetshire; the Caterthuns, near Brechin, in Forfarshire; the Barmkin of Echt, in Aberdeenshire. It is probable that the Saxons adapted the Roman castles to a certain extent to their modes of defense, and traces of Saxon and even Norman workmanship are found in struc-

tures which are believed to have been originally Roman. One very frequent change consisted in raising a mound of earth on one side of the walls on which the keep or citadel was erected. The Decuman and Prætorian gates were also, as at Portchester, converted into the fortified entrances peculiar to the castellated structures of the middle ages. But of castles designed for residence as well as defense, there are few or none which are of higher antiquity than the conquest. They were part of the organization of the feudal system—castle-guard being one of the duties which the tenants were taken bound to pay in return for their lands; and till that system was developed by the Normans, the residences of persons of importance were probably guarded only by their domestic retainers, or, in extraordinary circumstances, perhaps by the national militia. The absence of strongholds is said to have been a reason why William the Conqueror so easily became master of the kingdom; and it was as a protection against the resentment which the conquest occasioned, that most of the great Norman castles of England were built. As these castles grew in strength by the additions and improvements of each generation, they afforded their possessors the means not only of security from their fellow-subjects, but of independence as regarded the central government. The lord of every C. became a petty tyrant; and no small portion of the history of England, and, indeed, of Europe altogether, during the feudal period, consists of an account of the attempts which were made by the monarch to extirpate what Matthew Paris has emphatically designated as “these nests of devils and dens of thieves.” Of castles of this description, it is said that in England, in the reign of Stephen (1135–54), no fewer than 1115 were built.

The Norman C., which was the most complete structure of the kind, was generally surrounded by a moat or ditch; and in order that the ditch might be readily filled with water, the site chosen was usually either on the banks of a river, or on a peninsula running into a lake. In the latter case, the ditch was of course merely a deep cut made through the neck of land, by means of which the C. and its surroundings were converted into an island. On the inner side of the ditch, mounds were constructed, which were surmounted with walls and towers, both of which, but particularly the latter, were supplied with battlements and bastions. The entrance-gates were also protected by towers, which were usually of great strength. The communication was by a bridge, sometimes of stone, but usually of wood, which was made to draw up and down; and the entrance, in addition to thick folding-doors, was protected by a portcullis (q.v.), which was dropped down through grooves in the masonry at the sides. The gateway, in castles of the larger sort, was further defended by a barbican (q.v.). On passing the external wall, you entered the bailey (q.v.), which sometimes consisted of several courts, and contained the barracks, magazines, well, a chapel, and sometimes even a monastery. The only portion of the C. which was always spoken of as distinguished from the bailey, was the keep (q.v.) or citadel, which corresponded to the prætorium of the Roman fortification. The keep was a species of internal C., more strongly defended than any other portion of the fortress, and placed in the most advantageous position, so as to afford a last chance to the garrison when driven from the external works. As the keep had the same design as the C. itself, it contained most of its appliances, even to a chapel, when large and complete. The keep was also called the dungeon or donjon (q.v.). An excellent example of a keep is seen at Rochester Castle. The best known is probably that at Windsor, which forms so prominent an object in the surrounding landscape. The protection which the walls of his C. afforded to the retainers of a baron in a state of society in which life and property were extremely insecure, naturally led to the construction of houses around the moat, and to this custom a very large number of the towns, both in England and on the continent of Europe, owe their origin. Along the banks of the Rhine, this process of town-formation may be seen in all its earlier stages; from the few peasants' houses and the village church nestling under the ivy-covered ruin on the cliff, to the large and prosperous city of Coblenz. Strange as it may seem, the existence of these castles may be regarded not only as a cause, but as an effect of a certain feeling of security on the part of the surrounding population; for where a country was thoroughly insecure, the risk of the castles falling into the hands of the enemy, and thus proving a source not of protection but of oppression, was so great as to prevent their erection. It is on this ground that sir Walter Scott explains the slight character of the fortresses on the Scottish border, notwithstanding centuries of warfare. “It was early discovered that the English surpassed their neighbors in the arts of assaulting and defending fortified places. The policy of the Scotch, therefore, deterred them from erecting upon the borders buildings of such extent and strength, as being once taken by the foe, would have been capable of receiving a permanent garrison. To themselves, the woods and hills of their country were pointed out by the great Bruce as their safest bulwarks; and the maxim of the Douglasses, that ‘it was better to hear the lark sing than the mouse cheep,’ was adopted by every border chief.” For these reasons, “we do not find, on the Scottish borders, the splendid and extensive castles which graced and defended the opposite frontier. The Gothic grandeur of Alnwick, of Raby, and of Naworth, marks the wealthier and more secure state of the English nobles.” The residence of the Scottish chieftain, “was commonly a large square battlemented tower, called a *keep* or *peel*, placed on a precipice, or on the banks of a torrent, and, if the ground would permit, surrounded by a moat. In short, the sit-

uation of a border-house, encompassed by woods, and rendered almost inaccessible by torrents, by rocks and morasses, sufficiently indicated the pursuits and apprehensions of its inhabitants."—*Minstrelsy of the Scottish Border*, Introduction.

CASTLEBAR, the capital of the co. of Mayo, Ireland, 159 m. w.n.w. of Dublin. It is situated on the Castlebar river, near the head of a valley at the n.w. end of the great limestone plain which includes the greater part of the counties of Roscommon, Sligo, Galway, and Mayo. The two main streets cross each other, and the chief buildings are in a square near the w. end. The suburbs, as in most of the w. Irish towns, consist of the wretched hovels of agricultural laborers. Pop. about 3500. C. has some coarse linen manufactures. Here the Irish, in the rebellion of 1641, massacred the English parliamentary army, and in 1786 was executed the famous "fighting Fitzgerald." In 1798, the French gen. Humbert, held the town for a fortnight. In 1846 and 1847, C. suffered extremely from the famine.

CASTLEMAINE, a t. in the province of Victoria, Australia, 65 m. n.w. of Melbourne; pop. '91, 6082. It was a place of much importance when gold mining began, the diggings near by being among the earliest opened. The Victoria railroad passes through the town.

CASTLE PEAK, a peak of the Sierra Nevada in California, about 38° 10' n.; height, according to Whitney, 12,500 feet.

CASTLEREAGH, LORD. See LONDONDERRY, MARQUIS OF.

CASTLES, in heraldry, are often given as charges in the shields of persons who have reduced them, or been the first to mount their walls in an assault. The practice of heralds, in this as in other respects, has not been very consistent, as we learn that in 1602, a castle was granted by William Cambden, Clarenceux king of arms, to William Frear, doctor of physic.

CASTLETON, a town in Richmond co., N. Y., forming the n. portion of Staten island, and occupied in part by the summer residences of business men of the city, pop. '90, 16,423; in '80, 12,679. New Brighton is the only considerable village. The town is on the line of the Staten Island Rapid Transit railroad, which has ferry connections with New York at St. George, and with Perth Amboy, N. J., at Tottenville. Among the institutions is "Sailor's Snug Harbor," a home for old and indigent seamen, established about the beginning of the century by Capt. Randall. The surface of the township is hilly, and there are many charming sites occupied by handsome modern villas, from some of which wide views may be had over the city of New York, and large portions of New Jersey, Long Island, and the ocean.

CASTLETON, a town in Rutland co., Vt., 11 m. west of Rutland, on Castleton river and the Central, Vermont and other railroads; pop. '90, 2396. The slate quarries in the neighborhood are valuable. In the town is a state normal school. There are also manufactures of cheese, plows, carriages, etc.

CASTLETOWN, the capital town and seat of government of the Isle of Man, called in Manx *Ballei Cashtal*, or the town of the castle. C. is situated on the margin of Castletown bay, near the southern extremity of the island, and surrounds Castle Rushen, a Danish fortress of prodigious strength, having walls from 12 to 18 ft. in thickness, built of the limestone found on the spot, which is of so imperishable a nature that the sharp angles of the keep retain the marks of the builder's chisel, though completed in the 10th century. The castle was founded by Guthred II. of the Orrys kings of Man, and, having been added to from time to time, it now consists of a pile of building of a most imposing appearance. It underwent a six months' siege by Robert Bruce in 1313. The keep is used as the public jail of the island, and the other portion of the castle consists of public offices, officers' apartments, and accommodation for the chancery and other superior courts.

Being in the neighborhood of the bold coast-scenery of the Calf of Man, Spanish head, etc., C. is a desirable resort for the numerous tourists who frequent the Isle of Man. Pop. about 2500.

CASTOR, ANTONIUS, an eminent botanist of Rome in the first century after Christ; several times quoted and mentioned by Pliny. He had a botanical garden, probably the earliest on record. He lived more than 100 years in perfect health, it is reported, both of body and mind.

CASTOREUM, a substance secreted in two glandular sacs, closely connected with, but quite distinct from, the organs of reproduction in the beaver (q.v.), and at one time held in the highest repute in medicine, although now regarded as almost inert, and chiefly used by perfumers. The C. sacs are pear-shaped, and it appears in commerce in these sacs themselves, connected in pairs as they are taken from the animal. C. is produced both by the male and by the female beaver. In Hudson's bay commerce, ten pair of them are equal in value to one beaver skin. Russian C. is of much higher value than American. C. was well known to the ancients. From the time of Hippocrates, it was regarded as having a specific influence over the uterus, and is still in use in the

n. of Europe. It was at one time also esteemed a most valuable medicine in hysteria, catalepsy, and other spasmodic diseases.

CASTORIDÆ, a family of *mammalia*, of the order *rodentia*, of which the beaver (*castor*) is the type, and in which, besides the beaver, the coypu (*myopotamus*), and the *musquash*, some naturalists include other genera more commonly regarded as belonging to the mouse and rat family (*muridæ*), as the lemmings and voles.

CASTOR OIL, a fixed oil obtained from the seeds of the C. O. plant. In extracting the oil, the seeds are first bruised between heavy rollers, and then pressed in hempen bags under a hydraulic or screw press. The best variety of oil is thus obtained by pressure in the cold, and is known as *cold-drawn* C. O.; but if the bruised and pressed seeds be afterwards steamed or heated, and again pressed, a second quality of oil is obtained, which is apt to become partially solid or frozen in cold weather. In either case the crude oil is heated with water to 212° F. (100° C.), which coagulates, and separates the albumen and other impurities. Exposure to the sun's light bleaches the oil, and this process is resorted to on the large scale. When pure and cold-drawn, C. O. is of a light yellow color; but when of an inferior quality, it has a greenish, and occasionally a brownish tinge. It is somewhat thick and viscid. Its specific gravity is high for an oil, being about 960 (water being taken as 1000). It is miscible with alcohol or spirits of wine and ether. Reduced to a temperature of 0° F. (−18° C.), it becomes solid; exposed to the air, it very slowly becomes rancid, then dry and hard, and serves as a connecting link between the drying and non-drying oils. It has a nauseous smell, and an acrid, disagreeable, and sickening taste, which may be overcome by the addition of a little magnesia. The principal acid present in it is *ricinoleic* acid, $C_{18}H_{34}O_2$, which is allied to oleic acid.

C. O. is one of the most convenient and mildest of purgative medicines. Given in doses of one or two tea-spoonfuls, with a little peppermint-water, it forms a gentle laxative for habits easily acted on by medicine; while a dose of a table-spoonful, or a little more, will almost always succeed if it remains on the stomach. The only serious objections to the use of C. O., are its disagreeable flavor, and the sickness often produced by it; some persons get over this difficulty by floating the oil in hot coffee, which is said to remove its nauseous quality. It is, however, best given in gelatine capsules.

The adulterations of C. O. may be various. Several of the fixed oils, including lard, may be employed. The best test of its purity is its complete solubility in its own volume of absolute alcohol, which other fixed oils are not. Croton oil is occasionally added to increase the purgative powers of the oil.

The **CASTOR OIL PLANT** (*ricinus communis*) is a native of the s. of Asia, but now naturalized in the s. of Europe, and in other warm regions of the globe. The genus *ricinus* belongs to the natural order *euphorbiaceæ*. It has panicle flowers, with 3 to 5-partite perianth; the fruit a trilocular capsule, with one seed in each cell, the outside of the capsule generally covered with soft spines. The C. O. plant is often cultivated in gardens in the middle and even in the northern parts of Europe, where it is only an annual, attaining a height of 3 to 10 feet, but highly ornamented by its stately growth, its large, broad, palmato-peltate, 7 to 9-fid leaves, $\frac{1}{2}$ to 2 ft. in diameter, and its generally purplish hue. Its flowers are produced in long glaucous racemes. In warmer climates, it is perennial, and its stem becomes arborescent, attaining even 30 ft. in height, with a corresponding thickness, so that ladders are used for climbing it. Different species which have been described, are probably mere varieties. It was known to the ancients, and appears to have been valued by them. Its seeds have been found in Egyptian sarcophagi. From the resemblance of its seeds to an insect called *ricinus*, it received that name from the Romans. The seeds are oval, and about four lines long. They are chiefly valued for the oil which they yield, on account of which the plant is cultivated in the Levant, Spain, Provence, the West Indies, Brazil, the United States of America, as far n. as New Jersey, and in other tropical and warm temperate countries.—Although C. O. is chiefly used in medicine, it is not unfit for lamps and for oiling the wheels of machinery. The streets of Lima are lighted and the machines used in the works of the sugar plantations of Peru are oiled with it. The appearance of the C. O. plant obtained for it the name of *palma christi*, by which it is still sometimes called. Its seeds were formerly known as *semina cataputiae majoris*.

CASTOR and **POLLUX**, twin gods of Greece and Rome; known under the name of Dioscuri (from Dios or Jupiter, and Kouroi, children); children of Jupiter by Leda, who met the divinity in his form of a swan. The Dioscuri were specially revered among people of the Dorian race, and were said to have reigned at Sparta. They presided over public games, Castor being the god of equestrian exercises, and Pollux the god of boxing; but both were usually represented on fiery steeds, with spears, and egg-shaped helmets crowned with stars. They were the patrons of hospitality, and their aid was especially sought by travelers, to whom they were always gracious. Among their exploits were the invasion of Attica to rescue their sister Helen from Theseus; their part in the Calydonian hunt; their participation in the Argonautic expedition during which they married the daughters of Leucippus; and lastly their battle with the sons of Aphareus, in which Castor (the mortal brother) was slain by Idas. On finding him dead, Pollux, who was immortal, implored Jupiter to permit him also to die; but

Homer says the dead one was permitted to live again on condition that both should, on alternate days, descend to Hades, or that they should live only on alternate days. Another story is that they were placed among the stars, and now, as the Twins, form one of the 12 zodiacal signs. They were greatly venerated at Rome, where it was believed that at the battle of lake Regillus they fought at the head of the legions of the commonwealth, and afterwards with incredible speed carried to the city the news of the victory. Where they alighted near a well in the forum, a temple was built, and a great festival was held in their honor during the ides of Quintilis, the supposed anniversary of the battle, where sacrifices were offered at the public charge. A part of the ceremonies was a grand muster of the equestrian body, when all the knights, clad in purple and crowned with olive, assembled at the temple of Mars, out of the city, and rode in state to the forum where stood the temple of the twins. For centuries this pageant was one of the most splendid sights in Rome. In the days of Dionysius the cavalcade consisted of 5,000 horsemen, all persons of wealth and honorable repute.

CASTOR AND POLLUX, the two principal stars in the constellation Gemini (q.v.), were so called from Castor and Pollux, sons of Leda and Tyndareus, king of Lacedæmon. Their sister was the famous Helen of Troy. On account of their mutual attachment, Zeus placed them among the stars.

CASTOR AND POLLUX, the name given to a meteor, seen at sea, and which, under the form of twin balls of fire, attaches itself to the masts of ships. Sailors predict fair weather from its appearance. Sometimes, however, only one ball of fire is seen; the meteor is then called Helena, and it is regarded as foreboding a storm. Shakespeare makes mention of this superstition in the *Tempest* (act i. scene 2).

CASTRAMETATION is the art of encamping; and a *camp* is the result of that art. See **CAMP**.

CASTRATION, taking away or destroying the natural powers, or the essential organs of generation in animals; in males the removal of the testicles, and in females a mutilation or removal of the ovaries, commonly called "spaying." The general purpose is to make domestic animals more docile and useful, and more valuable for meat, as well as to restrict unlimited reproduction. These advantages are counterbalanced in part, at least, by the fact that castration diminishes the powers of endurance and the quickness of the intelligence. Castration may be performed at almost any age, but the effects of it are more pronounced if it be done before the age of puberty. With regard to the castration of human beings, see the article **EUNUCH**.

CASTREJON, ANTONIO, an eminent Spanish painter, was born in Madrid in 1625. His pictures show great versatility in their choice of subject and method of treatment, comprising scenes of an heroic nature as well as those of a domestic character. He was especially remarkable as a colorist. His best-known picture is his "Michael Warring with the Dragon." He died in 1690.

CASTREN, MATTHIAS ALEXANDER, the greatest authority in regard to the Finnish people and language, was b. in 1813, not far from the Lappish boundaries of Finland. He received his earliest instruction in the town of Tornea, and afterwards studied at Helsingfors. About the year 1838, he undertook a pedestrian excursion through Finnish Lapland, in order to extend his knowledge of the language and literature; and, in 1840, another through Carelia, to collect ballads, legends, etc., illustrative of Finnish mythology. On his return, he published in Swedish a translation of the famous Finnish poem, *Kalevala*, the meter and style of which have been imitated by Longfellow in his poem of *Hiawatha*. Aided by the government of his native province, he commenced his researches among the Finnish, Norwegian, and Russian Laplanders, as also among the European and Siberian Samoyeds. Appointed linguist and ethnographer to the St. Petersburg academy, C., between the years 1845 and 1849, prosecuted his laborious investigations as far e. as China, and as far n. as the Arctic ocean. On his return, he was appointed first professor of the Finnish language and literature at the university of Helsingfors. He employed himself in preparing for publication the vast materials which he had collected, but died 7th May, 1852, from exhaustion—a martyr to science. Before his death, appeared *Versuch einer ostfäcischen Sprachlehre nebst kurzen Wörterverzeichnis* (Petersburg, 1849), as the first installment of his *Northern Travels and Researches*. He also wrote *Elementa Grammaticæ Syrjæne* (Helsingfors, 1844), and *Elementa Grammaticæ Tscherenisse* (1845); *On the Influence of the Accent in the Lappish Language* (Petersburg, 1845); *De Affixis Personalibus Linguarum Altaicarum* (Helsingfors, 1850), etc.

CASTRES, a t. of France, in the department of Tarn, is situated on both sides of the river Agout, 46 m. e. of Toulouse. The two parts of the town are united by two stone bridges. In the middle ages, C. was celebrated for its Benedictine abbey, the heads of which exercised a temporal sway over the place. Later, it was one of the strongholds of the reformed party, but it was forced to submit, and had its fortifications demolished in the reign of Louis XIII. C. has beautiful promenades, shaded by fine alleys of trees, and in the neighborhood is a remarkable rocking-stone, 11 ft. high, and weighing some 30 tons. It is of egg-shape, and rests upon its smaller end; a strong push is sufficient to cause its vibration. C. is a busy manufacturing place. Its fine wool-dyed goods are

especially famous, and it has also manufactures of linen, leather, paper, soap, etc. Pop. '91, 27,509.

CASTRI, or **KASTRI**, a village of modern Greece, in the government of Phocis, situated on the s. declivity of Mt. Parnassus, and worthy of notice as occupying a portion of the site of the ancient Delphi (q. v.). The famous Castalian spring, now called the fountain of St. John, is situated between 200 and 300 yards to the e. of the village. Beside it grows a plane-tree, the only one in C., which is fabled to be that planted by Agamemnon.

CASTRO (ancient *Mitylene*), a seaport t. of Asiatic Turkey, capital of the island of Mitylene, situated on the e. coast, about 55 m. n.w. of Smyrna. It is surrounded with walls, and defended by a castle, and its streets are narrow and dirty. Pop. 6500.

CASTRO, a co. in n.w. Texas, formed 1876; organized in 1891. It is drained by Red river; 900 sq. m.; pop. '90, 115. Co. seat, Dimmitt.

CASTRO, **GUILLÉN DE**, 1569-1631; a Spanish dramatist who enjoyed the friendship of Lope de Vega, whom he assisted in the famous festival of the canonization of San Isidoro, where he won a prize in the literary tournament. Castro wrote about 40 plays, the most celebrated of which was *Las Mercedes del Cid*, to which Corneille was greatly indebted for the materials of his renowned tragedy. It is said that Castro died in poverty and was buried by charitable friends.

CASTRO, **HENRY**, 1786-1861; a native of France, an officer of the national guard of Paris, who, after the downfall of Napoleon, emigrated to the United States, and in 1827, was consul for Naples at Providence, R. I. He returned to Paris 11 years later, became a partner in the counting-house of Lafitte, and was made consul-general for the new republic of Texas. He engaged in the business of sending out emigrants, and within a few years established at Castroville and other places settlements which, after the annexation, were organized into Medina county.

CASTRO, **INEZ DE**, whose mournful fate is the subject of several tragedies and poems, was the daughter of Pedro Fernandez de Castro, and sprang from a branch of the royal family of Castile. She was appointed lady-in-waiting to the wife of Dom Pedro, son of Alfonso IV. of Portugal. Her beauty captivated Dom Pedro, and, after the death of his wife, in 1345, he secretly married Inez. Their stolen interviews took place in the convent of St. Clara, at Coimbra, until the secret was discovered and revealed to the king, who was made to believe that this union might prove injurious to the young Ferdinand, son of Dom Pedro by his deceased wife. Questioned by his father, Dom Pedro had not the courage to reveal the whole truth, while he refused to marry another. In the king's council, it was determined that Inez must die. To see this sentence executed, the king hastened to Coimbra, while his son, Dom Pedro, was engaged in hunting (1355); but the sight of the beautiful Inez, who, with her children, cast herself at the feet of the king, and prayed for mercy, diverted him for a few moments from his purpose. His advisers, however, soon obtained from the king permission to execute the sentence, and, in the course of an hour after the interview, Inez fell pierced by the daggers of assassins. Dom Pedro attempted a revolt against his father, but was pacified by the queen and the archbishop of Braga, and promised not to seek revenge for the death of Inez. Two years afterwards, the king died, having shortly before his death recommended the murderers of Inez to leave Portugal, and seek shelter in Castile, where Peter the Cruel was then ruling. As several of Peter's nobles had escaped into Portugal, to avoid his oppression, he now proposed to Dom Pedro an exchange of fugitives, to which the latter (then king of Portugal) consented. Two of the assassins accordingly were delivered up, and were tortured and burned. Two years afterwards, the king, in an assembly of the nobility, declared that he had been lawfully married, by papal sanction, and in the presence of the archbishop of Guarda, to Inez de Castro. When this statement had been confirmed by several testimonies, the king gave orders that the corpse of Inez should be removed from its grave, clothed in royal attire, with a crown on the head, and seated on a throne, should receive homage as queen. This strange ceremony was performed, the nobles of Portugal bowing before the enthroned dead, and kissing the hem of the royal robe. The body was then removed to Alcobaca followed by the king, with the bishops and the nobility, all on foot. A splendid marble monument was erected over the grave of Inez, surmounted by her statue, wearing a crown.

CASTRO, **JOÃO DE**, 1500-48; viceroy of the Portuguese Indies, son of the civil governor of Lisbon. He served in a military capacity in Tangier, Tunis, and elsewhere, and went to the Indies with his uncle, Garcia de Noronha. On arriving at Goa he enlisted among the "bravest of the brave" who were told off for the relief of Diu (a Portuguese settlement on an island of the same name, in the present province of Guzerat). Returning to Portugal he was made commander of a fleet to clear the European seas of pirates; and in 1545 he was sent out as viceroy of the Indies to supplant Martin de Souza. The next three years were full of struggle, suffering, and triumph. Valiantly seconded by his two sons, one of whom was killed before Diu, he overthrew Mahmoud, king of Cambodia, relieved the beleaguered town of Diu, and defeated the great army of Adhel Khan. He subsequently completed the subjugation of Malacca, soon after which he was fully commissioned as viceroy, but did not live long to fill the place, dying the next year in the arms of his friend, St. Francis Xavier. He was buried at Goa, but the body was after-

wards removed to Portugal, to be interred under a splendid monument in the convent at Bemfica.

CASTRO DEL RIO, a t. of Andalusia, Spain, situated on a slope on the right bank of the Guadajocillo, 16 m. s.e. of Cordova. A portion of the old town is surrounded by ruinous walls; the new town lying outside of these has some good streets. It has manufactures of woolen and linen fabrics, earthenware, etc., and considerable trade in agricultural produce. Pop. '90, 11,290.

CASTRO-GIOVANNI, a t. of Sicily, in the province of Caltanissetta, is situated 13 m. n.e. of the chief town of the province, on a remarkably fertile plateau, which rises precipitously to a height of 4,000 ft. above the sea-level. Castro-Giovanni occupies the site of the ancient *Enna*, of which Ceres was the presiding goddess, and her most famous temple was here. The neighborhood was the scene of Proserpine's abduction by Pluto. In connection with the Punic and Servile wars, Enna has a conspicuous part in early history. There are no remains of the old town. A castle and other buildings of Saracenic origin are still standing. The district yields large quantities of sulphur. Pop. about 19,000.

CASTRONUOVO, a t. of Sicily, in the province of Palermo, 25 m. n. of Girgenti. It is situated on a hill, is fortified, and in its vicinity are quarries of fine marble. Pop. 5,000.

CASTROVILLA'RI, a t. of s. Italy, in the presence of Cosenza, 34 m. n. of Cosenza. It is situated on an eminence surrounded by mountains, is partially fortified, and has an old massive castle, and a trade in wine, manna, silk, etc. Pop. 10,000.

CASTRUC'CIO CASTRACANI, 1283-1328; a Ghibelline exiled at an early age with his parents and others of that faction; orphaned at the age of 19; served as a soldier in England, France, and Lombardy, until in 1313 he returned to Italy and was chosen chief of the Ghibellines, who had obtained mastery over the Guelphs. Thenceforth he passed a stormy life, chiefly in the support of the emperor Louis V., whom he accompanied to Rome, and who made him duke of Lucca, count of the Lateran palace, and senator of the empire. Castruccio was excommunicated by a Guelphic legate, and died soon afterwards, leaving several children, whose fortunes were wrecked in the Guelphic triumph that followed his death.

CAST-STEEL. This term, until lately, was confined to steel made by melting blister-steel (q.v.), obtained by the old cementation process. Through this simple operation of melting it in crucibles, which was invented by an Englishman named Huntsman about the middle of last century, steel was first readily made perfectly homogeneous, and fitted for the production of the finer kinds of tools and cutting instruments. The crucibles are made of fire-clay, mixed with a small proportion of the material of old ones and coke. They are very carefully prepared and annealed, but notwithstanding this, the heat of the furnace is so high that they can only be three times used. Each crucible contains from 30 to 40 lbs. of steel, which is poured, when melted, into cast-iron ingot-molds previously smoked. The name "cast-steel," however, can no longer be confined to steel so made, because Bessemer steel, although produced by a quite different process, is truly a cast-steel. In Sheffield, the finer kinds of cast-steel are now sometimes called "crucible steel;" but since puddled steel, which, like the Bessemer, cannot be used for fine cutlery, is also cast in crucibles, such a term is not distinctive. See IRON.

CASTUE'RA, a t. of Estremadura, Spain, 68 m. e.s.e. of Badajoz. It is situated near the right bank of the Guadalefra, has several good streets, manufactures of brick, earthenware, etc., and a trade in agricultural produce; there is also some weaving carried on. Pop. 7100.

CASUAL POOR are persons temporarily relieved without being admitted to the roll of permanent paupers. See POOR-LAWS.

CASUALTIES OF SUPERIORITY, in the feudal law of Scotland, are such emoluments arising as to the superior as depend on uncertain events. See WARD-HOLDING.

CASUARINA, a genus of trees of the natural order *amentaceæ*, and of the sub-order *casuarineæ*, which is regarded by some as a distinct natural order. The trees of this genus are almost exclusively Australian; one only, *C. equisetifolia*, being found in the South Sea islands, the Indian archipelago, the Malayan peninsula, and on the e. side of the bay of Bengal, as far n. as Arracan. Some of them are large trees, producing timber of excellent quality, hard and heavy, the *beef-wood* of the Australian colonists, so called from the resemblance in color to raw beef. *C. equisetifolia* is called in Australia the SWAMP OAK. It is a lofty tree, the *toa* or *aitoa* of the Society islands, where it grows chiefly on the sides of hills, and where its wood was formerly used for clubs and other implements of war. It has been introduced into India, and is there much valued, as its wood bears a great strain, and is not readily injured by submersion in water. The hardness and durability of this wood led the earlier voyagers to the South Sea islands to designate it *iron wood*. *C. quadrivalvis* is the SHE OAK of New South Wales. **CASSOWARY TREE** is a popular generic name of the *casuarina*. Some of the species are scrubby bushes. All of them have a very peculiar appearance, their branches being long, slender, wiry, drooping, green, jointed, with very small scale-like sheaths instead

of leaves. They resemble arborescent *equisetaceæ*. The fruit consists of hardened bracts, collected in a *strobilus*, or cone, and inclosing small winged nuts. The flowers have neither calyx nor corolla; the stamens and pistils are in separate flowers, the male flowers with only one stamen, the female flowers with a one-celled ovary, the male flowers in spikes, the female flowers in dense heads. More than 20 species are known.

CASUISTRY, called by Kant the *dialectics of conscience*, is that branch of theology and morals which professes to deal with very delicate moral questions—*casus conscientie*—and which supplies rules and principles of reasoning for resolving the same; drawn partly from natural reason and equity, and partly from the authority of Scripture, the canon law, councils, fathers, etc. C. has been, and still is, studied chiefly by Roman Catholic theologians; but at one period Protestant divines also paid some attention to the perilous science. The rudiments of it, however, are to be sought for in antiquity. Traces of it are found in the Stoic philosophers of ancient Greece. This is not to be wondered at, for C. is not, in its essence, a device of the schoolmen, although the latter elaborated it into a science, but a natural expression of the intellect and moral nature of man, when he is placed in circumstances of great perplexity. The sound and healthy reason of antiquity, however, could not enter into the morbid refinement, or rather the insidious corruption of morals found in certain Jewish and Christian writers. The *Talmud* (q.v.) contains an enormous accumulation of casuistical questions, while the sphere of Christian ethics in the middle ages often became a mere arena for unprofitable and pernicious disputations of this nature, as is seen in such works as the *Summa Raymundiana*, *Summa Astesana*, *Summa Bartholina*, which obtained their names from their respective compilers. At a later period, the Jesuits Molina, Escobar, Sanchez, Busenbaum, etc., were accused of a gross abuse of ingenuity in the construction of moral puzzles, and of very flagrant immorality in their solutions. Some of them still "suffer the vengeance" of Pascal's immortal satire. It is nevertheless indubitable, that in the life of every man—now as formerly—*casus conscientie* will at times arise, when the higher laws of morality come into collision with subordinate conventional ones. The dubiety as to what the path of duty is, what *ought* to be done, resulting from this collision, naturally and legitimately leads to many nice considerations. If these are carried on under the guidance of a pure conscience, no harm can ensue, but, on the contrary, much good. Such, however, is not the alleged C. of the Jesuits, "the art of quibbling with God," as M. Le Feore, preceptor to Louis XIII., called it, in which a man seeks to justify, by subtle quirks, his immoral actions. Mayer has published an account of all the writers on cases of conscience, ranging them under three heads—Lutheran, Calvinistic, and Romish.

CASUS BEL'LI, or a case of war, is the reason alleged by one power for going to war with another. It is found impossible to reduce these causes or reasons to any definite code, because an ambitious or aggressive power has no difficulty in *making* a reason to declare to others, without acknowledging the real reason.

CASWALL, HENRY, D.D., 1810-70; b. in England, and emigrated to the United States at the age of 18, graduating at Kenyon college, Ohio. After some years of service as minister and professor of theology, in 1842 he returned to England, and procured a private act of parliament recognizing the validity of his ordination in the United States. He was appointed vicar, became proctor, and prebendary of Salisbury cathedral. About 1868, he returned to the United States, and he died in Franklin, Pa. He wrote *America and the American Church*; *Scotland and the Scottish Church*; *The Western World Revisited*; *The Martyr of the Pongas*; and two works on Mormonism.

CASWELL, a co. in n. North Carolina, on the Virginia border, watered by the tributaries of the river Dan, and intersected by the Southern railroad; 410 sq. m.; pop. '90, 16,028, includ. colored. The chief productions are tobacco, corn, oats, and wheat. Co. seat, Yanceyville.

CASWELL, ALEXIS, D.D., LL.D., 1799-1877; one of the corporators of the national academy of sciences. He was professor of mathematics in Brown university from 1828 to 1850, and of mathematics and astronomy from 1850 to 1864, and president from 1868 to 1872. Author of mathematical works and of a *Memorial of John Barstow*.

CASWELL, RICHARD, 1729-89; a revolutionary officer, native of Maryland, but an early settler in North Carolina, where he was for many years a member of the colonial assembly, speaker of the house, treasurer of the state, first governor, and thrice re-elected. He was a delegate to the convention that framed the federal constitution, and in 1787, was speaker of the state senate, and was presiding in that body when he was stricken with fatal paralysis. He was a brig.gen. in the patriot armies, and shared in the battle of Camden, and other conflicts.

CAT (Lat. *catus*), a name sometimes extended to the whole family of quadrupeds designated by zoologists *feliidæ* (q.v.), the genus *felis* of Linnæus; and sometimes more restrictedly applied to a section of that family, containing a number of its smallest species, the domestic C. and species most nearly allied to it. These form the subject of the present article. They all pursue their prey on the branches of trees more than on

the ground, and are most expert climbers, in which, however, they are rivaled by some of the other *felidae*. See St. George Mivart, *The Cat* (1890).

The origin of the domestic C. is by no means well ascertained; and by some naturalists it is described as a distinct species, under the name *felis domestica*, which perhaps may be regarded as at least a convenient provisional designation, until satisfactory reasons can be adduced for referring it to some species existing in a wild state. By many, indeed, the domestic C. has been confidently pronounced to be a mere domesticated variety of the common wild C. (*felis catus*) of Europe and the n. of Asia; but to this there are many objections; the most important being that it is always of smaller size, contrary to what is usually observed of the effects of domestication in animals; and that in cats of the domesticated race which have run wild, and in their known progeny, there is no appearance whatever of a tendency to return to the type of the true wild cat.—Another opinion as to the origin of the domestic C. has obtained the assent of a considerable number of naturalists; that it is derived from the *felis maniculata*, or gloved C. of n. Africa, a species discovered by the celebrated traveler Rüppell. But Mr. Owen has stated a perfectly conclusive reason against identifying the domestic C. with the *felis maniculata*, that the first deciduous molar tooth in the latter has a relatively thicker crown, and is supported by three roots, whilst the corresponding tooth both of the domestic C. and of the wild C. of Europe has a thinner crown, and only two roots.

The certainty, however that the C. existed as a domestic animal in ancient Egypt, makes it not improbable that we ought to look for its origin on the banks of the Nile, or in some of the countries from which the ancient Egyptians might most readily have obtained it. Of its rarity in Britain in former times, when the wild C. was common in all the woods which covered so much of the island, a curious evidence is afforded by a Welsh law quoted by Pennant—a law of the reign of Howel the Good, who died in 938 A.D.—fixing the prices of cats according to their age and qualities, beginning with a price for a kitten before it could see, and enacting that if any one stole or killed the C. that guarded the prince's granary, he was to forfeit a milk ewe, its fleece and lamb; or as much wheat as when poured on the C. suspended by its tail, the head touching the floor, would form a heap high enough to cover the tip of the tail.

It is needless to describe an animal so well known as the domestic C., or to do more than allude to its purring, its mewing, and the other sounds which it makes, its aversion to wet its feet or fur, its love of heat and comfort, its stealthy manners when in quest of prey, its patient watchfulness, so often fatal to mice, and other points of its natural history with which everybody is familiar.

The delight which a C. takes in tormenting a mouse before killing it, has sometimes been mentioned as an apparent exception to the general character of goodness manifest in the instincts of animals. It is an interesting circumstance, however, that when the prey is a bird instead of a mouse, a C. immediately inflicts a mortal wound, as if aware of its greater power of effecting its escape.

The eye of the C. is capable of much contraction and dilatation of its pupil, so that the animal can see in a very feeble light, and is thus adapted for those nocturnal habits to which, even in domestication, it shows so strong a natural tendency.

The fur of the C. is very free from any oily substance, so as to be readily injured by water, and is capable of being rendered highly electric by friction, particularly in very dry or frosty weather. An electric spark is readily obtained from the tip of the ear.

The strong statements of Buffon gave for a time great currency to the opinion, that the C. is incapable of affection, and retains, even in a domesticated state, its savage ferocity, merely restrained by selfishness, and disguised by cunning. The belief is very prevalent that the C. forms an attachment to places only, and not to persons. There are, however, well-authenticated stories which prove the C. to be capable of strong attachment to its master or mistress, although this quality is less frequently and remarkably displayed than by the dog. The instances which have, on the other hand, been recorded to show the attachment of the C. to places, are well worthy of attention in connection with the subject of instinct in animals. Some of these instances of cats finding their way back from great distances to their former home, are very wonderful, and indeed cannot be explained on any grounds or principles known. The same instinct and power, are displayed by other animals. See Romanes, *Animal Intelligence* (1892).

The varieties of the domestic C. are neither numerous nor very different. The *tor-toise-shell C.* differs from the most common variety chiefly in color, although it is also particularly elegant and delicate in form. It is much more common in the s. of Europe than in Britain.—The *Angora C.* is a beautiful variety, remarkable for its long silky hair.—The *Chinese C.* has a fine glossy fur.—The *Chartreuse* is of a bluish color.—The royal Siamese cat is fawn-colored, with blue eyes.—The *Manx* cat is tailless, and has longer hind legs. See illus., *CARNIVORA*, vol. III.

The wild C. is still to be found in a few of the woods of the n. of England, in the mountains of Wales, the Highlands of Scotland, and some parts of Ireland. It has entirely disappeared from districts where it was once common. It is the only beast of prey remaining in Britain the strength and fierceness of which make it at all dangerous to man; but an encounter with a wild C. is safe only to a man well armed. Fortunately, the instances of its attacking when unmolested are rare, but such instances have occurred. The wild C. is an inhabitant of deep thickets and recesses of woods, and of the rocky and

bushy ravines of mountainous districts. Its fur is held in considerable estimation. The fur is soft, long, and thick. The color of the face is yellowish-gray, with a band of black spots towards the muzzle; the forehead is brown; the head is gray, with two black stripes passing from the eyes, over and behind the ears; the back, sides, and limbs are gray, darker on the back, paler on the sides, with a blackish longitudinal stripe along the middle of the back, and numerous paler curved ones on the sides; the tail is ringed with light-gray and black, the tip being black. The length of a medium-sized male wild C. is almost 2 ft., exclusive of the tail, but this length is sometimes very considerably exceeded.—We know no record of any attempt to domesticate the wild cat.

The animal often called wild C. in America is the bay lynx. See LYNX.

Superstitions regarding Cats.—Cats have been objects of superstition from the earliest ages. In Egypt, they were held in the highest reverence; temples were erected in their honor; sacrifices and devotions were offered up to them; and it was customary for the family in whose house a C. died to shave their eyebrows. In the middle ages, they were regarded as the familiars of witches. The favorite shape of Satan was said to be that of a black C.; and the animal was an object of dread instead of veneration. There is or was a belief among sailors, that the frolics of a C. at sea portended a storm. Many people still prophesy rainy weather from a C. washing its face; and a cat-call on the housetop was formerly held to signify death. Their superstitious connection with witches, and the foolish belief that a C. has nine lives, have led to the perpetration of great cruelties upon this harmless and very useful domestic animal. See Brand's *Popular Antiquities*, Ellis's revised edition. See SUPERSTITION.

CAT, on shipboard, is a name for many of the ropes or lines employed. A *cat-fall* is a rope for heaving up the anchor from the water's level to the bow; it works through *cat-blocks*, and is connected with the *cat-head*. *Cat-harpings* are small ropes for tightening the shrouds. The *cat-heads*, just named, are two strong short timbers projecting from the bow, on each side of the bowsprit. A *cat-hook* fastens the ring of the anchor to the cat-block.

CAT, or CAT-CASTLE, in the military engineering of the middle ages, was a kind of movable tower to cover the sappers as they advanced to a besieged place. The garrison sometimes poured down burning pitch and boiling oil from the walls upon the C.; but occasionally this stratagem was disastrous, for the besiegers availed themselves of the blazing tower to burn the wooden gates of the town or fortress.

CATABAPTISTS (Gk. *kata*, against; *baptizein*, to baptize), a general name applied to those who deny the necessity of baptism. Zwingli (q.v.) applied the name to the Baptists, because they rejected the baptism of infants.

CATABROSA (Gr. *catabrōsis*, a gnawing), a genus of grasses formerly included in *aira* (see HAIR-GRASS), but distinguished by the leathery *paleæ*, which are ribbed, truncated, erose (as if gnawed at the points), awnless, and nearly equal. The glumes are much shorter than the spikelets, membranaceous, and very obtuse. The general appearance is different from that of the genus *aira*.—*C. Aquatica* is a pretty common British grass. It is of very wide geographic and climatic range, being found throughout Europe, from Lapland to the Mediterranean, and also in the torrid regions of South America.

CATACHRESIS. See RHETORIC, FIGURES OF.

CATACLYSM, a term used by geologists to denote great and sudden deluges, such as the Noachian flood, or violent upheavals, which are supposed by some writers to have swept over certain countries. The existence of cataclysms is affirmed by some to account for various phenomena, such as the deposit of different formations of drift or diluvium, which ordinary currents or the action of ice to their minds seems inadequate to produce. Cataclysm comes thus to be equivalent to any sudden convulsion or alteration of physical conditions.

CATACOMBS (Gr. *kata*, and *kumbos*, a hollow), subterranean chambers and passages formed generally in a rock, which is soft and easily excavated, such as *tufa*. C. are to be found in almost every country in which such rocks exist, and, in most cases, probably originated in mere quarries, which afterwards came to be used either as places of sepulture for the dead or as hiding-places for the living. The most celebrated catacombs in existence, and those which are generally understood when C. are spoken of, are those on the Via Appia, at a short distance from Rome. To these dreary crypts it is believed that the early Christians were in the habit of retiring, in order to celebrate their new worship, in times of persecution, and in them were buried many of the saints and martyrs of the primitive church. They consist of long narrow galleries, usually about 8 ft. high and 5 wide, which twist and turn in all directions very much resembling mines; and at irregular intervals, expand into wide and lofty vaulted chambers. The graves were constructed by hollowing out a portion of the rock, at the side of the gallery, large enough to contain the body. The entrance was then built up with stones, on which usually the letters D. M. (Deo Maximo), or XP., the first two letters of the Greek name of Christ, were inscribed. Other inscriptions and marks, such as the cross, are also found. The original extent of the C. is uncertain, the guides maintaining that they have a length of 20 m., whereas about 6 only can now be ascertained to exist, and of these, many portions have either fallen in or become dangerous. When Rome was besieged by the Lombards in the 8th c., many of the C. were destroyed, and the

popes afterwards caused the remains of many of the saints and martyrs to be removed and buried in the churches. Art found its way into the C. at an early period, and many remains of frescoes are still found in them. After being neglected for centuries they were again brought to notice by father Bosio, who spent thirty years in their exploration. His investigations were published in 1632, two years after his death; but the most exhaustive treatise on the subject in all its aspects is the *Roma Sotterranea* of De' Rossi (1864-67), of which an abridgment is published in English by Dr. Northcote. The C. at Naples, cut into the Capo di Monte, resemble those at Rome, and evidently were used for the same purposes, being in many parts literally covered with Christian symbols. In one of the large vaulted chambers there are paintings, which have retained a freshness which is wonderful, considering the time and the dampness of the situation. The palm-tree, as a memorial of Judea, is a prominent object in these pictures. At Palermo and Syracuse there are similar C., the latter being of considerable extent. They are also found in Greece, in Asia Minor, in Syria, Persia, and Egypt. See NECROPOLIS. At Milo, one of the Cyclades, there is a hill which is honey-combed with a labyrinth of tombs running in every direction. In these bassi-rilievi and figures in *terra-cotta* have been found, which prove them to be long anterior to the Christian era. In Peru and other parts of South America, C. have been discovered. The C. in Paris are a species of charnel-houses. For illustrations of catacomb paintings, see *illus.*, ROMAN ART, vol. XII.; see also *illus.*, BURIALS, ETC.

CATACOUSTICS. See ACOUSTICS.

CATAFALCO (Ital. a scaffold), or **CATAFALQUE**, a temporary structure of carpentry intended to represent a tomb or cenotaph, and adorned with sculpture and painting. It was employed in funeral ceremonies. The most magnificent C. ever made, perhaps, was that used at the interment of Michael Angelo, at Florence.

CATAHOULA, a parish in Louisiana, on the Tensas, Black, and Saline rivers; 1380 sq.m.; pop. '90, 12,002, inclu. colored. The soil is fertile, producing corn, cotton, etc Judicial seat, Harrisonburg.

CATALAN. See CATALONIA.

CATALANI, ANGELICA, a celebrated Italian singer, b. at Sinigaglia, Italy, in Oct., 1779. Her voice was strong and flexible, and she was educated in the convent of St. Lucien, where, in her seventh year, she displayed such wonderful vocal powers that strangers flocked from all quarters to hear her. She made her first public appearance at Venice in her 16th year, and experienced a succession of triumphs in every country in Europe for more than 30 years, amassing immense sums of money. The Italian opera in Paris was twice under her direction; but her husband's interference and extravagance brought her into much trouble. Her large queenly person and fine countenance, the immense volume, range, and flexibility of her voice, her power of sustaining her notes, in contrast with the lightness and facility of her unerring execution, everywhere took her audience by storm. Her expression, although fine, and her whole style, surprised rather than touched the heart. In concert singing, her great triumphs were in Rhodé's air with variations, and *God Save the King*—which she pronounced *God Shave the King*—and in oratorios, Luther's hymn, her delivery of which, especially when her marvelous voice alternated with the trumpet's sound, was so sublimely awful, that the audience were hushed and pale, and some were borne away fainting. The throat from which these wondrous sounds proceeded was physically of such dimensions, that a physician, when called to look into it, declared he could have passed down a penny-loaf. In 1830, Madame C. purchased a villa near Florence, formerly belonging to the Medici family, where she gave free instructions to girls who had a talent for singing, on condition of their taking the name of Catalani. In the spring of 1849, when political disturbances broke out in Tuscany, she repaired with her daughters to Paris, where she died of cholera on the 13th of June.

CATALAUNIAN PLAIN (*Campi Catalaunici*), the ancient name of the wide plain surrounding Chalons-sur-Marne, in the old province of Champagne, France, celebrated as the field of battle where the west Goths, and the forces under the Roman gen. Aëtius, gained a great victory over Attila in 451 A.D. A wild tradition (made the subject of a striking picture by Kaulbach, "Die Hunnenschlacht," or "The Battle of the Huns") tells that three days after the great fight, the ghosts of the fallen myriads appeared on the plain, and renewed the conflict.

CATALEPSY (*katalepsis*, a taking possession of), a state of more or less complete insensibility, with absence of the power of voluntary motion, and statue-like fixedness of the body and limbs in the attitude immediately preceding the attack, a like position being also retained, unless altered by force, until the return of consciousness. Such is the abridged description of C., as commonly given in works of authority. The patient is usually in good health at the time of seizure, or subject only to nervous affections, such as hysteria (q.v.); sometimes the attack is preceded by disappointment, fear, violent exciting or depressing passions, or even religious emotions, being in such cases only an extreme form of what is otherwise called trance, reverie, or ecstasy (q.v.); on other occasions, the apparent cause is more purely physical, as in some of the hysterical cases, depending on suppressed menstruation. In all cases of cataleptic rigidity and insensi-

bility, it may be presumed that the brain, as the organ of consciousness, is disturbed; but it does not appear that in any considerable proportion there is structural disease. Patients rarely die during the attack, which may, however, be protracted for an indefinite period, and may even endanger life indirectly by the debility consequent on imperfect nourishment. The circulation and respiration are, in most instances, little affected; cases, however, have been recorded in which, in consequence of their failure, the patient has been supposed to be dead. See DEATH. Many of the recorded cases of C. are little worthy of credit, and it has even been doubted whether this curious disease can ever be said to exist exempt from some degree of deception, or at least voluntary and conscious regulation of the muscles on the part of the person affected. The combination of C. with hysteria, and its frequent association with what are called the higher phenomena of mesmerism (see ANIMAL MAGNETISM), are undoubtedly circumstances of great suspicion; but it would certainly be wrong to suppose that all the cases described were fictitious, and not less so to classify them all under the head of pure imposture. Epidemic C. has been described, and in such cases it would appear plain that the principle of imitation, so powerful in producing nervous disease, must have been at work. The remedies of C. are the same as those of the states to which it is so nearly allied, and of which it may be said to form a part. Moral means form a large part of the treatment, as in hysteria. In some cases, it may become necessary to administer food by means of the stomach-pump, and this even for weeks or months.

CATALOGUE (Gr. a list). See BIBLIOGRAPHY, BRITISH MUSEUM, LIBRARY, STARS.

CATALONIA (Spanish, *Cataluña*), an old province and principality of Spain, now divided into the provinces of Barcelona, Tarragona, Lerida, and Gerona, the total area being 12,180 m., and the pop. '87, 1,838,799. C. occupies the north-eastern corner of Spain, having France on the n., and the Mediterranean on the e. and s.e. It is watered by the Llobregat and the Ter, and by some of the affluents of the Ebro, the last-mentioned river having its embouchure in Catalonia. The coast is rugged, its boldest promontories being capes Creus and San Sebastian, and its deepest indentations the bays of Rosas and Tarragona. With the exception of a few low plains of limited extent, the soil of C. is that of a wild mountainous region formed by numerous offsets or terraces of the Pyrenees, one great ridge or series of ridges extending through the center of the province.

The terraces, sloping abruptly down to the coast, or to the narrow coast plains, are divided by the valley of Llobregat into the lower and the upper Catalonian mountains.

The climate of C., though fog and rain are frequent, and extreme and rapid changes of temperature prevail, is on the whole healthy and favorable to vegetation. Near Barcelona, oranges flourish in the open air; the fields in some parts are bounded by aloe-hedges, and olives grow on Montserrat. Cork-trees grow on the mountains, and thickets of thorn-apple, laurel, myrtle, pomegranate, box, rosemary, etc., extend where the cork has its limits. Northern upper C. has a more severe winter than the s.; but everywhere vineyards and olive-gardens cover the slopes, and cornfields extend in the valleys. Among the other products are hemp, flax, madder, barilla, and saffron. Hazel-nuts, a variety called Barcelona nuts, are extensively grown. Meadow-lands and pastures are comparatively rare, and horned cattle are, therefore, mostly confined to the districts bordering on the Pyrenees; while few horses and mules are kept; but sheep, goats, and swine are bred in considerable numbers. Silk-worms and bees are also reared. The coasts abound with fish, and game is plentiful. The minerals are coal, copper, manganese, zinc, lead, cobalt, salt, sulphur, and many varieties of marble.

C. is the principal manufacturing province of the kingdom—is, in fact, “the Lanca-shire of Spain.” The inhabitants are neither French nor Spaniards, their language, costume, and habits being quite distinct from those of either; they have also local coins, weights, and measures. In energy, industry, and intelligence, they greatly surpass the rest of the Spaniards. On their language see SPANISH LANGUAGE AND LITERATURE.

C., under the name of *Hispania Tarraconensis*, was one of the earliest, and remained among the last of the Roman provinces. It was invaded and captured by the Alans, who were followed by the Goths, hence its name *Gothalamia*, changed into Gothermalunia or Catalonia. In the 8th c., the Arabs gained possession of the southern part. When Charlemagne, in 788, subjugated Spain as far as the Ebro, C. formed the central portion of the Spanish mark, governed by French counts, having Barcelona as their residence. They soon made themselves independent of France. In 1137, earl Raymund Berengar, by his marriage, united C. with Aragon; and the marriage of Ferdinand and Isabella (1469) united both with Castile, and so C. became a portion of the Spanish monarchy, but never a very peaceable one. In modern times it has repeatedly taken a prominent share in Carlist or other insurrections. See Balaguer, *Historia de Cataluña* (Madrid, 9 vols., 1885-87).

CATALPA, a genus of trees of the order *bignoniaceæ*. The *catalpa syringifolia* is a native of the s. portion of the United States, and is cultivated there and in the cities of the northern states as an ornamental shade-tree. It may be known by silver-gray bark, wide-spreading but few branches, and the fine pale green of its large heart-shaped leaves. The flowers are white, tinged with violet or purple, and dotted with the same colors. The flowers are succeeded by long bean-like pods, that sometimes hang on the

otherwise bare limbs all winter. The wood is light and of fine texture, and useful in cabinet work. There is a catalpa in London said to have been planted by lord Bacon.

CATALYSIS (Gr. dissolution) is a term applied in chemical physics to a force supposed to be exerted by one substance upon a second, whereby the latter is subjected to change or decomposition, whilst the former, or acting substance, remains comparatively unaltered, and does not combine with it. The force, indeed, has been ascribed to the mere "action of contact." Fermentation is an example of this force (see **BEER**), when one part of yeast acting upon the sugar of the sweet worts, without entering into combination with it, compels 100 parts of sugar to pass into alcohol and carbonic acid. Germination, or the sprouting of grain when placed in the ground, is another example where one part of *diastase* changes 1000 parts of starch into sugar.

CATAMARAN, in its original form, consists of three logs—the middle one being longest—lashed together; used by the natives of the Coromandel coast, particularly Madras; also used in the West Indies, and coast of South America. The Fiji Islanders developed this idea in their war-canoes, which consist of two parallel logs joined together with a platform on which a mast is placed. These boats are safe and very swift, having a speed of about fourteen miles an hour. This again is surpassed by the flying proa of the Ladrone Islanders, a boat with two hulls of unequal size. The larger hull, which carries all the rigging, is perfectly flat on one side and rounded on the other. On this are placed bamboo poles projecting beyond the rounded side, and to their ends is fastened a boat-shaped log, one-half or one-third the size of the larger hull. This prevents capsizing as effectually as the Fiji double canoe. Both ends of the proa are made alike and the boat is sailed with either end first; but the outrigger is always on the windward. The flat side of the hull, being always on the lee-side, acts as a centre-board. Against a head-wind the proa is kept away till the stern approaches the wind, when the yard is swung round, and what was the stern becomes the bow. Proas are from forty to sixty-five feet long and six or seven feet wide, and are said to attain a speed of twenty miles an hour. See **CANOE**.

Double boats, or catamarans, have often been built in this country, but have almost always proved very slow, because the water between the two bows is compressed into a narrowing space and offers great resistance. This defect is illustrated in the English twin steamer *Castalia*, which in spite of her great engine-power was a slow boat. Another example of a steam catamaran is the *Henry W. Longfellow*, built about 1880. Two iron cylinders two hundred feet long, shaped like cigars, sharp at both ends, were fastened to each other at a distance of nine feet. On them rested a deck 125 feet long, like a ferryboat. She could carry 475 passengers, had 500 horse-power, a displacement of 75 tons, and her entire weight was only 43 tons. In 1876 the *Amaryllis* was designed and built by Herreshoff. She consisted of two slender tubes connected by cross-beams loosely fastened together, and supporting a deck hardly more than large enough for two men. She was entered at the Centennial Regatta, at New York, and easily beat all competitors, but was ruled out on account of her construction. In spite of her great speed, she was very uncomfortable and very unsafe. In 1877 Herreshoff patented a double-hulled boat combining the greatest stability with least weight. The hulls were united by ball and socket joints, which obviated the unevenness in position of the two hulls in a rough sea, and were set sixteen feet apart, each having a centre-board and rudder. The boat had a sloop-rig, and with a strong wind abeam and a smooth sea, made twenty miles an hour. Many catamarans have been built since, but generally with rigid connections, and prove unsatisfactory in rough water. In a racing catamaran 25 feet long the proportion is one foot canvas to eight pounds of water displacement. This shows the sailing powers of the catamaran. If in construction iron cylinders were used, in shape like the hulls of the flying proa, and placed with the flat sides toward each other, great speed would be secured with safety. Under proper conditions the catamaran is well adapted to summer sailing in smooth waters, being easy to handle, fast, and safe.

CATAMARCA, a province in the Argentine republic, between 25° and 29° s., and 66° and 69° w., lying at the foot of the Andes; 31,500 sq.m.; pop. '95, 90,187; the greater portion being of pure Indian blood. The province is intersected by several mountain-chains; and by many small streams, most of them dry in the summer, but in winter subject to destructive floods. Some of the plains are sandy deserts, while others are periodically inundated; and when the water dries away, it leaves a coating of salt, which is gathered for home use and for trade. Gold, silver, and copper are found, the latter in abundance; and nearly all the fruits and grains of tropical and temperate regions are grown. The cotton of C. is especially esteemed.

CATAMARCA, the capital of the province of Catamarca, in the Argentine republic, 28° 20' s., 66° 25' west. It is a regular and moderately well-built town of about 7500 inhabitants. Of public buildings, there are a town-house, a Franciscan monastery, and a convent. There is considerable import-trade of European goods, and the place is a center of distribution for a flourishing district. Dried figs, wines, brandy, and cotton are the principal articles of export.

CATAMENIA. See **MENSTRUATION**

CATAMOUNT. See **PUMA**.

CATANIA, or **CATANEA**, a city and seaport of Sicily, situated on the e. coast, near the foot of Mt. Etna, 31 m. n.n.w. of Syracuse. The fertile and well-cultivated neighborhood of C., extending along the s.e. base of Mt. Etna, is styled "the granary of Sicily," and has given to C. the title, "La Bella Catania." By eruptions of the great volcano and attendant earthquakes, the city has been several times almost entirely destroyed, especially in the year 1693; but out of its ruins it has always risen with increased beauty, and it is now the finest city in Sicily, being built throughout on a beautiful and consistent plan, from which no deviation is allowed. The harbor of C., formerly good, was choked by a stream of lava in 1693, and the mole was partly destroyed, so that now it has only a roadstead, which is guarded by a fort, and serves as a landing-place. It has several squares, the finest of which, in front of the cathedral, has a statue of an elephant sculptured in lava. Among its chief public buildings are the Benedictine convent and church of San Nicolo, with one exception the grandest structure of the kind in Europe; the town-hall; the cathedral, with its noble granite columns; and the university, founded in 1445. It has besides many handsome churches and convents, and several educational and charitable institutions, and is the seat of one of the three high courts in the island. The inhabitants, formerly much more numerous, amounted in 1894 to 123,100, and are distinguished by their commercial spirit and industry. C. has manufactures of silk and linen goods, and of articles in amber, lava, wood, etc. Among the remains of ancient times, that earthquakes have spared, are those of a theater, an odeium, a temple of Ceres, Roman baths, and an aqueduct. C., anciently known by the name of *Catana*, was founded by a Greek colony of Chalcidic origin, in the latter part of the 8th c. B.C.; and as early as the beginning of the 5th c. B.C. it was esteemed one of the most flourishing towns in Sicily. It was taken by the Athenians under Nicias, and was desolated by Dionysius I.; but again rose under the Roman sway into its former importance. Augustus here founded a Roman colony. It suffered at the hands of the Goths, but once more, under the Byzantine empire, became one of the principal cities in the island. C. gives name to the province of which it is the capital, and which is one of the richest in Sicily, with an area of 1917 sq. miles, and a pop., in 1895, of 672,025.

CATANIA, **GULF OF**, an inlet of the Mediterranean, on the e. coast of Sicily, extends in the form of a semicircle from La Trezza bay to cape Santa Croce, a distance of 18 miles. It is about 10 m. deep, and receives the river Giaretta.

CATANZARO, a city of s. Italy, in the province of the same name, is beautifully situated on the declivity of a rocky hill, near the gulf of Squillace. On account of its agreeable climate, many wealthy families have made it their residence. It has a cathedral. Pop. about 25,000. Pop. of province in 1895, 467,136.

CATAPLASM (a Greek term for a poultice), an application to diseased or painful parts, for the purpose of promoting suppuration, relieving pain, and stimulating or soothing the skin, according to circumstances. A C. may be composed of any moist pulpy substance of sufficient consistence to retain the water without dripping or soaking through the thin muslin covering in which it is generally wrapped. The making of a poultice well is a matter of some nicety, and unless the proper consistence is given to the mass, the application is apt to do more harm than good. The linseed-meal poultice is the most easily made, and most satisfactory of all soothing applications. The meal is stirred gradually into a sufficient quantity of boiling water, placed in the bottom of a small basin or teacup, until a perfectly smooth pulp is formed of the proper consistence, and in quantity sufficient to cover completely, to the thickness of three quarters of an inch, the whole pained part. The pulp is then folded up in muslin or thin calico, and applied as soon as the heat will permit it to be borne. The bread and milk, or even bread and water poultice, is also very good; as is also the oatmeal-porridge poultice, to which a little butter may be added with advantage. A spoonful or two of yeast may be added, if there are foul discharges, or peat charcoal may be sprinkled on the surface of the poultice before it is applied. Carrot poultices are in great favor with the people in some parts of the country. Hemlock poultices, made of the fresh leaves, or of the dried leaves, with the aid of some powder of the leaves, form a valuable sedative application in painful diseases; and poppy-heads, or even opium, are sometimes infused in the water of which a poultice is made, for the same purpose. A stimulating C. or poultice may be made by sprinkling oil of turpentine, or chloroform, or mustard in moderate quantity on the surface of any ordinary poultice. When considerable irritation of the skin in a short time is desirable, a mustard C. or sinapism (*sinapi*, mustard) is used.

CATAPULTA, an engine of war used by the ancients, somewhat resembling the crossbow. In the C., a string or rope, suddenly freed from great tension, gave a powerful impulse to an arrow placed in a groove. There were great catapultas fixed upon a scaffold with wheels, which were used in sieges, and small ones, carried in the hand, which were employed in the field. See **BALISTA** AND **ARBALEST**. See illus., **BATTERING RAMS**, vol. II.

CATARACT, an opaque condition of the lens of the eye. It is readily distinguished from opacities of the cornea, or clear front part of the eye, by its position just behind the pupil—that round and varying aperture in the iris through which light is admitted

into the back of the eye. C. may affect the lens alone (lenticular C.), or the front or back of the capsule of the lens (capsular C.), or both lens and capsule (capsulo-lenticular cataract). Its whiteness varies from that of half-boiled white of egg to that of snow. Heat will produce a like change on the lens out of the body, just as it changes white of egg from transparent to opaque. The rounded lens of the fish is seen at table in this opaque condition.

C. is painless, and unaccompanied by inflammation. It occasions blindness simply by obstructing the passage of the light; but C. alone does not produce so complete blindness but that the patient can tell light from darkness. It may occur at any age, but is most common in elderly persons, and is not unfrequent in children, who may be even born with it. The catoptric test, now disused, was an ingenious method of distinguishing incipient C. from certain other deep affections of the eye. When a lighted candle is held before the eye of a person whose back is to the window, three candles are seen in the healthy eye. Two are erect—the large front one caused by the convex cornea, the smaller and fainter one behind by the convex front of the lens. The third, occasioned by the concave back of the lens, is in the middle; is small, bright, and turned upside down; and, when the candle is moved, goes in the opposite direction, while the two erect images move with the candle. When the back of the lens becomes opaque, the inverted image is obscured, or disappears; and when the front of the lens is affected, only the great front image, caused by the cornea, remains. At the present time, cataract is accurately detected by concentrating light upon the eye and illumining its interior by means of the ophthalmoscopic mirror, the eye being previously dilated by some mydriatic, such as duboisine or atropine. No difficulty then arises in determining at once the nature of the disease.

No medical or other treatment has any influence in arresting the progress of C., nor can it be cured but by a surgical operation. A clever imposture used to be practiced by quacks. By applying belladonna to the eye—as the surgeon does when he wishes to dilate the pupil for an examination or operation—some little light was temporarily admitted through the less opaque edge of the lens. The patient beginning to see somewhat better, after long and increasing dimness of vision, began to congratulate himself on a cure; the quack, of course, hastened to get his money without waiting for the further result, which was sure to be blank disappointment. So long as there is fair vision with one eye, the operation on the other may be delayed. It is a mistake to delay the operation in children on account of their tender age. The sooner it is done the better, both for the eye and the education of the child.

Three methods of operation are practiced. 1. For *Absorption* or solution. This is suitable for children, in whom the C., like the natural lens, is soft, and in all other cases in which there is reason to suppose that the C. is soft. An appropriate needle is passed through the cornea; made to open and lacerate the front of the capsule, the rags of which curl out of the way behind the iris, so that their subsequent opacity does not obstruct the light; then the soft cataractous lens is punctured and picked so as more effectually to admit the aqueous humor, which naturally fills the space between the lens and the cornea, and which has the remarkable property of absorbing or dissolving the lens or cataract when admitted within the capsule. This operation may require to be repeated several times, at intervals of a few weeks, before the whole C. is dissolved. 2. *Displacement*. A needle is passed through the fore part of the white of the eye, until it is seen through the upper part of the pupil, lying across the front of the upper part of the lens. This is now pressed back, so as to make the lens sink down and back into the vitreous humor, when it is either slowly absorbed, or may in part permanently remain. The older method of displacement, termed couching, in which the lens was pushed more directly downwards, is now abandoned, as more likely to press on the retina, and cause subsequent evil to the eye. 3. *Extraction*. Half the cornea, through nearly its whole breadth, is divided by an incision, an operation requiring great skill; the front of the capsule is opened, and disposed of with a needle; and the lens is gently assisted out of its place, through the pupil, and out of the opening in the cornea, great care being taken not to allow the vitreous humor to follow. Displacement and extraction are both applicable to hard cataracts, the form it generally takes in old age, as the lens itself becomes naturally harder with age, as well as more flat and amber-tinted. Displacement is more likely to be followed by bad consequences, some time after, from the presence of the displaced lens, while the risk of extraction is greater at the operation. The surgeon must decide which is best for each case. Though not so simple and successful as the operation for absorption through the cornea for soft C., displacement and extraction are generally very successful in restoring vision. The place of the lens is supplied by fluid humor, the refracting power of which is nearly equal to that of the lens, and the restoration of vision may be perfect. All of these operations require minute anatomical knowledge (see EYE), and great nicety and skill in the use of the instruments,

CATARACTS AND RAPIDS. See WATERFALLS.

CATARRH (Gr. *katarreo*, I flow down), a disease of great frequency in temperate latitudes, especially in changeable moist climates in the winter season. From its well-known connection with sudden falls of temperature, and other epidemic or atmospheric causes (see INFLUENZA), as also from the chill often experienced at the commencement

of the disease, it is popularly called a *cold*—a term, however, perhaps somewhat less definite in its meaning than *C.*, which word is usually restricted to the case of a cold affecting the chest, and attended with discharge of mucus by coughing. A “cold in the head” is termed, in strict scientific language, *coryza*; we shall, however, keep both forms in view in the present article. *C.*, or cold, commonly begins with a feeling of chilliness, which may or may not be attributable to external causes. Sometimes this is absent, there being only a sense of languor and indisposition; not unfrequently there is no sensation of an unusual kind, until a stuffing is experienced in the nostrils, or severe headache, or hoarseness with cough, or oppression of the breathing. The regular form of a cold is to attack the nostrils first, and afterwards the air-passages leading to the chest. When it habitually attacks the chest, without running through its ordinary course as indicated above, there is often some special cause of delicacy in the lungs, or some constitutional tendency towards consumption (q.v.). The discharge is in the beginning watery, becoming afterwards more abundant, glairy, and of yellowish color; the early stages of the disease are attended by considerable irritation of the surfaces affected, and probably no one of the little miseries of life is more prostrating and discouraging for the time than a bad cold in the head. The tendency of *C.* to attack the chest, and thus to pass into bronchitis or pneumonia (q.v.), or to lay the foundation of tubercular disease, constitutes almost its only danger. See CHEST.

The treatment of a cold is commonly a simple matter, so far as the particular attack is concerned. Confinement to the house, and, in severe cases, to bed, or to the sofa, for a day or two; a warm hip or foot bath, to remove the chill; light farinaceous diet, and, if the stomach and bowels are at all loaded, a dose or two of some gentle laxative, are commonly sufficient to subdue the disease. Some persons cure their colds by entire abstinence from food, and as much as possible from drink; others by a large opiate, or by a succession of doses of Dover's powder; others by spirit of mindererus and paregoric; some even profess to carry out the popular maxim, “stuff a cold, and starve a fever,” and maintain that a good dinner, and a tumbler of whiskey or brandy toddy, are the best specifics. That colds get well under all these methods, needs not be denied; but that any violently perturbative or specific practice assists the cure, or shortens the disease, has yet to be proved; and multiplied experience has shown, that “stuffing a cold” is by no means to be commended. In the later stages, however, a more liberal diet than at first, and in some cases even a moderate allowance of stimulants, affords considerable relief from the feeling of depression that remains for a time on the subsidence of a catarrh. The tendency to this disease, when habitual, and when not dependent on any form of constitutional disorder requiring special means for its cure, is best met by the daily use of the cold bath, with frequent exercise in the open air, and proper ventilation of the sleeping-apartment; also by friction of the skin, and by clothing, which, without being oppressive, is comfortably warm. Exposure to draughts or sudden chills, when the surface is perspiring, is to be avoided; but a close confined air habitually breathed in a workshop or bedroom, is a fruitful predisposing cause of the disease.

CATASAU'QUA, a borough in Lehigh co., Pa., on Lehigh river, 3 m. n. of Allentown; pop. '90, 3704. The Lehigh Valley and the New Jersey Central railroads unite here. It has water-works, electric lights, blast furnaces, machine-shops, silk mills; and a high school, national bank, and weekly newspapers.

CATASTROPHISM, the doctrine that vast geological changes, with the correspondent changes in living forms, were sometimes due to catastrophes, such as the upheaval of mountains, the sudden disturbance of seas, strata, etc.: opposed to Uniformitarianism. The advocates of *C.* claim that the changes which have taken place in types are not sufficiently explained by evolution and natural selection, as taught by Huxley, Darwin, and many others; and that the importance of environment as a factor in these changes has been overlooked. The “moments of great catastrophes become moments of creation,” and out of plastic organisms the new forms are born.

CATAW'BA, a name of wines, both still and sparkling, produced in various parts of the United States. They are made from a grape called the Catawba grape, “first found growing wild near Washington, D. C., by Major Adlum.” This wine, which is scarcely known in England, is now in extensive use in North America, where it is gradually superseding the importation of the Rhenish and French sparkling wines, to which, in general character, it bears a resemblance. See AMERICAN WINES.

CATAW'BA, a co. in w. North Carolina, on the Catawba river, on the Chester and Lenoir and the Southern railroads; 388 sq. m.; pop. '90, 18,689. Co. seat, Newton.

CATAW'BA, or **GREAT CATAW'BA**, a river rising in the Blue Ridge, in n.w. North Carolina, and flowing e. and s. through the gold region of that state into South Carolina, where it takes the name of the Wateree and joins the Congaree, the two forming the Santee. The *C.* is about 250 m. long.

CATAW'BAS, Indians of North Carolina, once a large tribe in the region of Catawba river, but now a mere remnant. At the time of the early white settlements, they could muster many thousands of warriors, and as late as the revolution were able to furnish a valuable contingent to the Carolina troops. They occupied several towns

along the river that still bears their name; but at last leased the lands to the whites, and removed into the territory of the Cherokees, with whom they had been at war. After a short residence they returned to a reservation in their original district. Their language is closely allied to that of the Waccos and the Carolina tribe. Peter Harris, a revolutionary soldier, was said to be the last full-blooded survivor of the Catawba tribe.

CATBALO'GAN, or CADVALONGA, a t. of the Philippines, capital of the island of Samar, on a small bay on the w. coast. The houses are mostly constructed of nipa palm, but there are some of stone. Pop. about 7,000.

CAT-BIRD, *Turdus felivox*, an American thrush, of the same group with the mocking-bird, which it resembles in its vocal powers. It is a bird of passage, making its way northward in spring through Georgia and Carolina as far as Massachusetts. It feeds on fruit and berries of all kinds, worms, and insects; builds a large nest of dry twigs, weeds, etc., without any attempt at concealment, in a bush or tree, often in the immediate vicinity of human habitations, and shows extraordinary boldness in the defense of its young. It has its name from a mewling cry which it utters when annoyed by an intruder approaching too near its nest.

CAT-BOAT, a small sailboat, usually not more than thirty feet in length, rigged with a large fore-and-aft mainsail only, set on a boom and gaff, and having the mast stepped as far forward as possible. Such a rig as this is called a *cat-rig*.

CATCH, a species of musical composition peculiar to England, and in the canon style. The words of the C. are generally humorous, and intended to be sung in social parties over a glass. The music is generally for three voices, of which there exist hundreds of specimens from the time of Purcell to the present day. As in the canon, each voice takes up the subject at a certain distance after the first has begun. One of the best specimens of a C. is by Calcott, on Hawkins's and Burney's histories of music, where the humor lies in one of the parts repeating "Burney's history"—sounding like "burn his history"—while the others are advocating Hawkins. See **ROUND**.

CATCH-DRAINS, open drains, and sometimes covered drains, along a declivity to intercept and carry off surface water.

CATCHFLY, the common English name of several plants of the natural order *caryophyllaceæ*—as *silene armeria*, *S. Anglica*, *lychnis viscaria*, etc.—which being clammy, in consequence of a peculiar exudation, on the calyx, on the joints of the stem, etc., often prove fatal to insects settling upon them. See **LYCHNIS** and **SILENE**.—The name is sometimes employed by botanists as a sort of popular equivalent to *silene*.—*Dionæa muscipula* is also sometimes called the Carolina catechism. See **DIONÆA**.

CATCHPOLL, a sheriff's officer, or bailiff, is so called in England, probably because he was in use to catch his victim by the *poll*, or head.

CATEAU, LE, or CATEAU-CAMBRESIS, a t. of France, in the department of Nord, situated on the Selle, 14 m. e.s.e. of Cambrai. C. has manufactures of shawls, merinoes, calicoes, and leather; it has also breweries and distilleries. Pop. '86, 9686.

CATETHETICAL SCHOOLS, the name given to the ancient Christian schools of theology, of which the chief were those of Antioch and Alexandria. Clement and Origen were the most famous of the teachers.

CATECHISM, from a Greek word, *katecheō*, which means to resound, or sound into one's ears; hence to instruct by word of mouth. Persons undergoing instruction in the principles of Christianity were hence called *catechumens* (*katechoumenoi*), and the teacher appointed for this purpose was called a *catechist*. Hence any system of teaching by question and answer is called a catechism.

Catechisms have long formed one of the principal means employed for popular instruction in the truths and duties of the Christian religion. The composition of the first catechisms was, in all probability, suggested by the ordinary oral instruction of catechumens, and was intended for the help both of teachers and pupils. It appears to have been in the 8th and 9th centuries that the first regular catechisms were compiled, of which that by Kero, a monk of St. Gall, and that ascribed to Otfried of Weissenburg, are among the most noted. At later periods, the use of catechisms prevailed chiefly among the opponents of the hierarchy, as among the Waldenses, the Albigenses, the Wickliffites, and, above all, among the Bohemian brethren. The term C. appears to have been first employed in its present sense among the latter. At an early period in the history of the reformation, the reformers began to avail themselves of this method of popular instruction, and their catechisms became important instruments in that great religious movement. In 1520, Luther published his first short catechism. In 1525, Justus Jonas and John Agricola were intrusted with the preparation of a catechism. In 1529, Luther published his larger and smaller catechisms, which found a place among the symbolical books or standards of the Lutheran churches. A number of catechisms were published also by the Swiss reformers, and by those of England and other countries. The Geneva catechisms, larger and smaller, were the work of Calvin. They were published in 1536, were speedily translated into various languages, and became acknowledged standards of the reformed churches, not only in Switzerland but in the low countries, in France, and

in Hungary. The church of Geneva has set aside the authority of these catechisms.—The Zurich C. is received as a standard in the church of Zurich.—The Heidelberg or palatinate C. is of greater importance, however, than any other as a standard of the Swiss reformed churches. It was compiled by the Heidelberg theologians, Caspar Olevian and Zacharias Ursinus, at the request of the elector Frederic III. of the palatinate; it was published in 1563, was approved by several synods, and was subjected to a revision by the synod of Dort.—In the church of Rome, the Romish or Tridentine C. is of high authority. It was prepared in accordance with the decrees of the council of Trent, by archbishop Leon. Marino, bishop Ægidius Foscorari, and the Portuguese dominican, Francis Fureiro; revised by cardinals Borromeo, Sirlet, and Antonian, and sanctioned by pope Pius V. It was published at Rome in 1566.—The C. of the Orthodox Greek church was prepared by Peter Mogilas, metropolitan in Kiev, and published in 1642. It received authority as a standard or symbolical book from a synod at Jerusalem in 1672. It is often called the larger Russian C., to distinguish it from the smaller C., prepared by order of Peter the Great.—Besides these catechisms, which have a historic interest, or are of importance from their symbolical character, there have appeared at all periods, since the reformation, many others, both Protestant and Roman Catholic, some doctrinal, some controversial, some devoted to particular subjects, as the sacraments, or to particular purposes, as the preparation of candidates for admission to the Lord's supper, some adapted to the mental capacity of very young children, etc. The opinion, however, has become prevalent, that doctrinal abstracts are not the best form in which religion can be presented to the young, and the use of catechisms has accordingly been in some measure relinquished in favor of other methods of instruction.

The C. of the church of England, with which we are most familiar, is the smaller one published in the book of Common Prayer. It is in two parts: the first contains and explains the baptismal covenant, the creed, the ten commandments, and the Lord's prayer; the second explains the two sacraments, baptism, and the Lord's supper. It is not known with absolute certainty who was the author of the first part; probably Cranmer and Ridley had the principal hand in framing the questions and answers. It was originally put forth with the 42 articles in the reign of Edward VI., and condemned as heretical in the reign of Mary. It must not be confounded with Cranmer's C., which was a larger work, differently arranged, and translated chiefly from the German C. used in Nuremberg. This first part of the church C. is spoken of as the *shorter* catechism.

There was a *larger* church C. compiled also in the reign of Edward VI., by Ponet, as is supposed, and it corresponds in some degree with the smaller work above described. It was afterwards revised and enlarged by Noel, dean of St. Paul's, and published in 1570; and though never officially promulgated by the church, it has some authority from having been approved by the lower house of convocation. At the Hampton court conference, in the reign of James I., the *shorter* C. was considered too short, and the larger one of Noel's too long; and accordingly, at the king's suggestion, an addition was made to the former of that explanation of the two sacraments which now forms the second part of the church catechism. This was drawn up by Dr. Overall. The whole is a work much esteemed by all sections of the church, as remarkable for its simplicity, truth, and catholicity. It, however, states the baptismal theory in a way that is not very acceptable to the extreme low church party. The rubrics in the Common Prayer book enjoin the teaching of the C. in the church on Sundays and holidays after the 2d lesson at evening prayer; and the 59th canon contains a like injunction, imposing penalties on the clergy who neglect this. The custom of catechizing in the church had fallen into almost universal disuse, but in many parishes it has been revived with excellent results.

The larger and shorter catechisms, which, with the Westminster confession of faith, constitute the standards or symbolical books of the Presbyterian churches throughout the British empire and the United States of America, were compiled by the assembly of divines at Westminster: the shorter C. "to be a directory for catechizing such as are of weaker capacity;" the larger, "for catechizing such as have made some proficiency in the knowledge of the Christian religion." The shorter C. was presented to the English house of commons on 5th Nov., 1647; the larger on the 14th April, 1648; and in July, 1648, both received the sanction of the general assembly of the church of Scotland—the general assembly, in the act approving of the larger C., declaring it to be "a rich treasure for increasing knowledge among the people of God," and that "they bless the Lord that so excellent a catechism has been prepared." The shorter C. has, however, been far more generally used for the purpose of instruction than the larger, which has been generally felt to be too minute in its statements, and too burdensome to the memory to be employed as a catechism. Even the shorter C. is regarded by many, who substantially adhere to its doctrine, as carrying the statement of dogmatic theology beyond what is proper for elementary instruction, whilst it has been long felt to be unsuitable for the very young and the very ignorant, and its use is now almost always preceded by that of catechisms more adapted to their capacity. Its influence, however, has been very great in forming the religious opinions, and in exercising and training the intellectual faculties, wherever Presbyterianism has prevailed; for it has been, and still

is, in almost universal use among Presbyterians speaking the English language, and to a considerable extent among Independents or Congregationalists both in Britain and America. In Holland also, a translation of it has been much used. It is very generally regarded, by those whose doctrinal views are in accordance with it, as an admirable compend of Christian doctrine and duty.—The authorship of the Westminster assembly's catechisms has been the subject of much debate, or at least the authorship of the first drafts of them; it being admitted that they were prepared with great care by committees of the assembly. But the probability appears to be, that their authorship is to be ascribed entirely to these committees; and that, like the Westminster confession of faith, they are thus the result of the joint labors of many. From discoveries made by the late Dr. M'Crie, it seems probable that at least the plan or scheme of the shorter C. is to be ascribed to Mr. Palmer.

CATECHU, a substance employed both as a coloring matter and medicinally as an astringent. The C. of commerce is obtained chiefly from East Indian trees, such as the C. tree (*acacia catechu*), betel-nut, etc.; but the greater part of that which is exported from India is made from the C. tree. It is known in India by the name *knitt*; and C. is said to be a name compounded of two words signifying the *juice of a tree* (*cate*, a tree, and *chu*, juice). Cutch is another form of one or other of these names, and is a common commercial name. The heart-wood alone of the tree yields C., which is obtained by cutting it into small chips, and boiling it in water, straining the liquid from time to time, and adding fresh supplies of chips, till the extract is of sufficient consistence to be poured into clay molds, which are usually of a square shape; or when of the thickness of tar, it is allowed to harden for two days, so that it will not run, and is formed into balls about the size of oranges, which are placed on husks of rice or on leaves, and appear in commerce enveloped in them. The C. manufacturers in Northern India move to different parts of the country at different seasons, and erect temporary huts in the jungles, where they carry on their operations. The C. tree abounds chiefly in the Bombay and Bengal presidencies; it is a small, erect, thorny tree, with a roundish head of (generally) prickly branches. Its sapwood is yellow, the heart-wood dark red. C. is brittle, and can readily be broken into fragments; is soluble in water, and possesses an astringent taste, but no odor. It is a very permanent color, and is employed in the dyeing of blacks, browns, fawns, drabs, and greens. It contains much tannin, and an acid called catechuic acid, which can be isolated in white silky crystals. It is often adulterated with earthy substances, but its ready solubility in water and alcohol, should at once show the presence of such, by leaving them behind in an insoluble state.—The C. of the betel-nut is obtained by boiling first the nuts, and then the extract to a proper consistency. A first boiling of the nuts for some hours is said to yield a black kind of C., called *kassu*; and a second boiling, after the nuts are dried, a yellowish-brown kind, called *coury*, which is considered the best, and is sold for the highest price. The former appears in commerce under the name of colombo C. or Ceylon C. (or cutch) in the form of circular flat cakes, covered on one side with husks of rice. The latter does not seem to reach Europe.—Gambier may be regarded as a kind of catechu. Kino (q.v.) is sometimes confounded with catechu. *Terra Japonica*, or Japan earth, is an old name for C., not quite disused, which was given to it on the supposition of its being an earthy substance brought from Japan.

CATECHUMENS (Gr. persons undergoing a course of instruction; see CATECHISM), the appellation given, in the early Christian church, to those converted Jews and heathens who had not yet received baptism, but were undergoing a course of training and instruction preparatory to it. They had a place assigned them in the congregation, but were not permitted to be present at the dispensation of the Lord's supper. In the apostolic age, converts appear to have been at once admitted to the sacraments; but afterwards this ceased to be the case, and a period of probation was required. The C. were divided into different classes or grades, according to their proficiency—those of the lowest grade were not permitted to be present during the prayers of the congregation; and those only of the highest, and who had been declared fit to be baptized at the next administration of the ordinance, were permitted to witness the dispensation of the Lord's supper.—The term C. was afterwards employed to designate young members of the Christian church who were receiving instruction to prepare them for confirmation or for the Lord's supper, and it is still often used in this sense.

CATEGORIES. This designation has come down to us from Aristotle. One of the books of his *Organon* or Logical System is so named. The C., or predicaments, as the schoolmen called them, are to be understood as an attempt at a comprehensive classification of all that exists, for the purposes of logical affirmation, proof, or disproof. The entire universe may be classified in various ways—as into things celestial and terrestrial; into matter and spirit; into organized and unorganized; into minerals, plants, animals, etc. But the classification contemplated under the C. proceeds on the very general properties or attributes that most extensively pervade all existing things, although in unequal degrees. A good example is quantity, which pertains to every thing that we know or can think of. We give the Aristotelian enumeration—the first column is the

original Greek; the second, the Latin rendering of the schoolmen; the third, the nearest corresponding English words:

Οὐσία,	Substantia,	Substance.
Ποσόν,	Quantitas,	Quantity.
Ποιόν,	Qualitas,	Quality.
Πρός τι,	Relatio,	Relation.
Ποιεῖν,	Actio,	Action.
Πάσχειν,	Passio,	Passivity.
Πού,	Ubi,	Position in space.
Πότε,	Quando,	Position in time.
Κεῖσθαι,	Situs,	Situation.
Ἐχειν,	Habitus,	Possession.

Mr. J. S. Mill has the following remarks on the above scheme: "The imperfections of this classification are too obvious to require, and its merits are not sufficient to reward, a minute examination. It is a mere catalogue of the distinctions rudely marked out by the language of familiar life, with little or no attempt to penetrate, by philosophical analysis, to the *rationale* even of these common distinctions. Such an analysis, however superficially conducted, would have shown the enumeration to be both redundant and defective. Some objects are admitted, and others repeated several times under different heads. It is like a division of animals into men, quadrupeds, horses, asses, and ponies. That, for instance, could not be a very comprehensive view of the nature of Relation, which could exclude action, passivity, and local situation from that category. The same observation applies to position in time and position in space; while the distinction between the latter and situation is merely verbal."—*Logic*, book i., chap. iii. § 1. Some writers have endeavored to save the C. from these objections, by declaring that the fourth, Relation, is to be looked upon as a general head, comprehending the remaining six under it. But there is no evidence that Aristotle had this view in his mind; on the contrary, it appears almost certain that his idea of Relation was too narrow and limited to admit of his giving it so great a comprehension.

Mr. Mill gives us the result of his own analysis, the following enumeration and classification of existences or describable things:

1. Feelings, or states of consciousness; which are the most comprehensive experience that the human mind can attain to, since even the external world is only known as conceived by our minds.

2. The minds which experience those feelings.

3. The bodies, or external objects, which are supposed to excite all that class of feelings that we denominate sensations.

4. The successions, and coexistences, the likenesses and unlikenesses, between feelings or states of consciousness. Although the relations are considered by us to subsist between the bodies, or things, external to our minds, we are driven in the last resort to consider them as really subsisting between the states of each one's own individual mind.

Mr. Mill shows that all possible propositions—and it is with the truth or falsehood of propositions that the science of logic has chiefly to do—affirm or deny one or other of the following properties or facts: Existence—the most general attribute of all—Co-existence, sequence or succession, causation—a peculiar case of succession—and resemblance. It is to arrive at this classification of propositions, for the purposes of logic, that the foregoing analysis, corresponding to the Aristotelian C., was made. The properties affirmed of any thing or things, or the things of which any properties are affirmed, come under some one or other of the four heads above given.

The C. of Kant, which are sometimes brought into comparison with those of Aristotle, are conceived under a totally different point of view. See sir W. Hamilton's *Discussions on Philosophy*, 2d edit., p. 26. They refer to certain forms supposed to be inherent in the understanding itself, under which the mind embraces the objects of actual experience. The Kantian philosophy supposes that human knowledge is partly made up of the sensations of outward things—color, sound, touch, etc.—and partly of intuitions existing in the mind prior to all experience of the actual world. This is the point of difference between the school of Locke—who rejected all innate ideas, conceptions, or forms—and the school of Kant. No such question was raised under the Aristotelian categories. Kant's enumeration of his innate forms is as follows: 1. Quantity, including unity, multitude, totality; 2. Quality, including reality, negation, limitation; 3. Relation, including substance and accident, cause and effect, action and reaction; 4. Modality, which includes possibility, existence, necessity. These indicate the elements of our knowledge *a priori*; it being the opinion of the author, that such notions, as causation, necessity, etc., cannot be obtained from the exercise of our senses and intelligence upon the world of realities, but must have been somehow or other imprinted upon the mind originally. See ANTINOMY: KANT.

CATEL, FRANZ, 1778-1856; a German artist who first gained reputation by his illustrations of Goethe's *Hermann and Dorothea*. He labored in Paris and Rome, and his works found their way all over the continent. He left all his fortune for the benefit of poor artists.

CATENARY. The C. is the curve formed by a flexible homogeneous cord hanging freely between two points of support, and acted on by no other force than gravity. If the cord is not homogeneous, and the density varies in any regular way, the cord hangs in a curve slightly different in shape from that of the ordinary catenary. The C. possesses several remarkable properties, one of which is, that its center of gravity (q.v.) is lower than that of any curve of equal perimeter, and with the same fixed points for its extremities. Where the cord is such that the weight of any part of it is proportioned to its horizontal projection, the curve is a parabola (q.v.). The latter curve and the ordinary C. are of importance chiefly in the theory of suspension bridges (q.v.).

CATENIPORA, a genus of fossil lamelliferous corals peculiar to paleozoic strata, confined in Britain to the Silurian measures. The genus is easily recognized. The cells are terminal and oval, arranged like a loose net-work of chains, hence called "chain coral." Vertical anastomosing lamellæ united the cells together, and formed a hemispherical polypidom, sometimes of great size. See illus., SILURIAN AND DEVONIAN FOSSILS, vol. XIII.

CATERAN or **CATHERAN**. (Gaelic and Irish *ceatharnach*, a soldier), originally an Irish or Highland soldier; frequently, however, used of a robber or freebooter.

CATE'RNA, SANTA, a t. of Sicily, in the province of Caltanissetta, and 7 m. n.n.w. of the town of that name. It is situated on a hill near the river Salso. Pop. 7200.

CATERPILLAR, the name given to the larvæ of lepidopterous insects—butterflies, moths, and hawk-moths. Caterpillars exhibit as great differences as subsist among the perfect insects into which they change, and the family, genus, and species may be determined by the characters of the C., as well as of the perfect insect. Their body is generally long, nearly cylindrical, soft, and consisting of 12 rings or segments besides the head, with nine spiracles or small openings for respiration on each side. The head is much harder than the rest of the body, of a sort of almost horny substance, and has 6 small shining points on each side, which are regarded as simple or *stematic* eyes, and is also furnished with two very short rudimentary antennæ. The mouth is adapted for tearing, cutting, and masticating the substances on which the C. is destined to feed, which are very various in the different species, although in all extremely different from the food of the perfect insect; it is provided with two strong *mandibles*, or upper jaws: two *maxillæ*, or lower jaws; a *labium*, or lower lip; and four *palpi*, or feelers. In the mouth also is situated the *spinneret* of those species which, when they change into the chrysalis or pupa state, envelop themselves wholly in silken cocoons. See SILK. The first three segments of the body are each furnished with a pair of feet, which are hard and scaly, and represent the 6 feet of the perfect insect; some of the remaining segments are also furnished with feet, varying in all from 4 to 10 in number, the last pair situated at the posterior extremity of the body; but these feet are soft and membranous or fleshy, and armed at their extremity with a sort of circlet of minute hooks. All the feet or legs are very short. Those caterpillars in which the *pro-legs*, as they are sometimes called, or supplementary soft feet, are pretty equally distributed along the body, move by a sort of regular crawling motion; but those which have only four such feet situated near the posterior extremity, move by alternately taking hold by what may be called their fore-feet and their hind-feet, now stretching the body out to its full length, and now bending it into an arch, whilst the hinder part is brought forward almost into contact with the forepart. Caterpillars which move in this way are called *geometers* or *loopers*. Some caterpillars have the power of fixing themselves by the two hind feet to a twig, and stretching themselves out as straight as a rod, so that being in color very like a twig of the tree on the leaves of which they feed, they are not readily observed. The muscular power required for this position of rest is very great, and Lyonnet found the number of muscles in a C. to be more than 4,000. The skin of some caterpillars is naked, that of others is covered with hairs, spines, or tubercles. Some make for themselves nests or tents of silk, under which they dwell in societies, protected from the inclemency of the weather. Many construct cases or sheaths by agglutinating various substances together, as the C. of the common clothes-moth. Some roll together leaves, and fix them by threads, so forming a dwelling for themselves; and a few burrow and excavate galleries in the substance of leaves. Many feed on leaves; many being limited to a particular kind of plant, or to a few nearly allied plants. Some feed on flowers, some on seeds, some on roots, and some even on the woody portions of stems; some on wool, hides, furs, and other animal substances; a few on lard, and other kinds of fat. Among the admirable arrangements which make all nature harmonious, is the adjustment of the time of each kind of C.'s appearance to that of the leaf or flower on which it is to feed. See illus., BUTTERFLIES, ETC., vol. III.

CATERPILLAR FUNGUS, or FUNGOID PARASITES, a species of fungus that attacks insects, particularly the larvæ of moths and beetles, filling their bodies and sending shoots beyond the skin so that the creature takes the appearance of a vegetable growth. These growths vary in length from a slight projection to nearly a foot, and in diameter from a hair to a quarter of an inch.

CATES'BY, MARK, 1680-1749; an English naturalist who was seven years in the American colonies, returning to England in 1719 with a fine collection of plants. Ho

made another journey in 1722, exploring South Carolina, Georgia, Florida, and the Bahamas. He published *Natural History of Carolina, Florida, and the Bahama Islands*, in which the figures were etched by himself from his own paintings, etc.

CAT-FISH, a name given to several species of the family *Siluridæ*, dwelling in American rivers and lakes. The common cat-fish, or horned pout, of the Atlantic slope, is preferred above most river fish for food. They are from 7 to 9 in. long, dusky brown in color on the back and sides, and white underneath. The upper jaw is the longest; the tail is rounded; skin without scales and commonly covered with a slimy secretion. It has two fleshy barbels (long beard-like spines) on the top of the nose, and others at the angles of the jaws. Its mouth is very large. Immense cat-fish are found in the great lakes and western rivers, more than 4 ft. long and weighing 60 to 150 lbs. See *illus.*, *FISHES*, vol. VI.

CATGUT is employed in the fabrication of the strings of violins, harps, guitars, and other musical instruments; as also in the cords used by clockmakers, in the bows of archers, and in whip-cord. It is generally prepared from the intestines of the sheep, rarely from those of the horse, ass, or mule, and *not* those of the cat. The first stage in the operation is the thorough cleansing of the intestines from adherent feculent and fatty matters; after which they are steeped in water for several days, so as to loosen the external membrane, which can then be removed by scraping with a blunt knife. The material which is thus scraped off is employed for the cords of battle-doors and rackets, and also as thread in sewing the ends of intestines together. The scraped intestines are then steeped in water, and scraped again, when the large intestines are cut and placed in tubs with salt, to preserve them for the sausage-maker; and the smaller intestines are steeped in water, thereafter treated with a dilute solution of alkali (4 oz. potash, 4 oz. carbonate of potash, and 3 to 4 gallons of water, with occasionally a little alum), and are lastly drawn through a perforated brass thimble, and assorted into their respective sizes. In order to destroy any adherent animal matter, which would lead to putrefaction and the consequent development of offensive odors, it is customary to subject the C. to the fumes of burning sulphur—sulphurous acid, which acts as an antiseptic (q.v.), and arrests decomposition. The best strings are used for musical instruments; and those which come from Italy, and are known as *Roman strings*, are the strongest. They are remarkable for their clearness and transparency. Cord for clockmakers is made from the smallest of the intestines, and occasionally from larger ones, which have been split longitudinally into several lengths. Whip-cord is fabricated from C. which has been twisted in a manner somewhat similar to single-corded ropes. The C. obtained from the intestines of horses, asses, and mules is principally made in France, and is employed instead of leather-belts for driving machinery.

CATHA, a genus of the natural order *celastraceæ*. The fruit is a three-cornered capsule.—*C. edulis*, sometimes called **ARABIAN TEA**, the **KHÂT** of the Arabians, is a shrub with erect smooth branches, elliptical obtusely serrated leaves, and small flowers in axillary cymes. It is a native of Arabia, and the Arabs ascribe to its leaves, even carried about the person, extraordinary virtues as a preventive of plague, with probably about as much reason as our forefathers had for esteeming the rowan tree formidable to witches. When fresh, they are stimulant, narcotic, and intoxicating, and are eaten with greediness by the Arabs. They are very antiseptific, so that a man, after using them, may keep watch for a whole night without drowsiness.

CATHARI, or **CATHARISTS** (Gr. pure), a name very generally given to various sects which appeared in the church during the middle ages. It appears to have been sometimes assumed in profession of a purity of doctrine and morals superior to that which generally prevailed in the church, sometimes bestowed ironically in ridicule of such a profession, and perhaps was first used as a designation of the Paulicians (q.v.). It became a common appellation of sects which appeared in Lombardy in the beginning of the 11th c., and afterwards in France and the w. of Germany. Having some connection with the Bulgarian Paulicians, they were sometimes called *Bulgarians*; sometimes also *Patarenes* or *Patarines*, sometimes *Publicans* or *Popelicans*, and in the Low Countries, *Pipholes*. The names *Albigenses* and C. are often used as equivalent to one another; but we are under the disadvantage of having to depend entirely on the writings of very bigoted adversaries for our knowledge of their doctrines and practices, and considerable obscurity rests on all this interesting part of ecclesiastical history. Manicheism, Gnosticism, and Montanism are ascribed to the C.; but there is much reason to think that the errors of a few were often indiscriminately charged upon all, and that such charges indeed sometimes rested on ignorant or willful misconstruction. It appears quite certain, that the C. differed considerably in their doctrines and in the degree of their opposition to the dominant church. Some of them advocated and practiced a rigid asceticism. There is no good evidence that any of them nearly approached to the doctrines of the reformation; although in their rejection of tradition, of the authority of Rome, of the worship of saints and images, etc., there are notable points of agreement with the views of the reformers.

CATH'ARINE is the name of six saints of the Roman Catholic church. The simple designation of *Saint C.*, however, is given to a virgin, said to have been of royal descent

in Alexandria, who, publicly confessing the gospel at a sacrificial feast appointed by the emperor Maximinus, was put to death in 307 A.D., after being tortured on a wheel. Hence the name of "St. Catharine's wheel." Very extraordinary legends exist as to her converting 50 philosophers sent by the emperor to convert her in prison, besides a multitude of other persons; the conveyance of her head by the angels to Mt. Sinai, etc. She is regarded as the patroness of girls' schools.—*Saint C. of Siena*, one of the most famous saints of Italy, was the daughter of a dyer in Siena, and was born there in 1347 A.D.; practiced extraordinary mortifications; and was said to be favored with extraordinary tokens of favor by Christ, whose wounds were impressed upon her body, etc. She became a Dominican, and, therefore, afterwards a patron saint of the Dominicans. She wrote devotional pieces, letters, and poems, which have been more than once printed: the best edition appeared at Siena and Lucca, in 1707-13, in 4 vols. 4to, under the title of *Opere della serafica Santa Catarina*.—*St. C. of Bologna* and *St. C. of Sweden* are of less note.

CATHARINE I., Empress of Russia, was originally by name Martha Rabe, and was the posthumous daughter of John Rabe, a Swedish quarter-master in Livonia. Her mother died in 1685, when she was but three years old. Left hopeless and destitute, a parish-clerk took compassion on her, and supported her, and a Lutheran clergyman in Marienburg, afterwards received her into his house as an attendant on his children. In 1701, she married a Swedish dragoon, who next year was called to active service; and Marienburg being taken by the Russians, she became for some time the mistress of gen. Bauer; and afterwards entering the service of the princess Menschikoff, she attracted the notice of Peter the Great. In 1703, she went over to the Greek church, and took the name of Catharina Alexiowna. After being for some years the emperor's mistress, she was privately married to him in 1711; the marriage was publicly avowed in 1712; she was proclaimed empress in 1718, and was crowned at Moscow in 1724. She bore eight children to the emperor, all of whom died in childhood, except two daughters, Anne and Elizabeth, the latter of whom was afterwards empress of Russia, and the former married the duke of Holstein, and was the mother of the emperor Peter III. When Peter the Great and his army seemed entirely in the power of the Turkish army on the Pruth in 1717, C., who was with him, sought an interview with the grand vizier, and, by employing her jewels to bribe his attendants, succeeded in procuring the deliverance of the Russians. Her conduct on this occasion excited so much admiration and gratitude in the emperor, that he resolved to appoint her his successor. Yet in the end of the year 1724, she became the object of his displeasure and suspicion, on account of an alleged intimacy with a chamberlain, whom he caused to be beheaded. Menschikoff, who had always been attached to her interests, was at this time in disgrace. But she had contrived in a great measure to recover her position, when, on 28th Jan., 1725, Peter the Great died. His death was kept secret as long as possible, that everything might be arranged for her taking possession of the throne; and the archbishop of Pleskow came forward and declared before the troops and people, that the emperor, on his death-bed, had declared her alone worthy to be his successor. The hostility and hesitation of the nobles were at once overcome, and C. was acknowledged as empress and sole ruler of all the Russias. Under Menschikoff's directions, the affairs of government went on well enough for a time; but the empress ere long began to yield to the influence of a number of favorites, addicted herself to drunkenness, and lived such a life as could not fail to hurry her to the grave. She died, however, unexpectedly, 17th May, 1727.

CATHARINE II., empress of Russia, was b. at Stettin on 25th April, 1729. Her father, the prince of Anhalt-Zerbst, was a Prussian field-marshal, and governor of Stettin. She received the name of Sophia Augusta; but the empress Elizabeth of Russia having selected her for the wife of her nephew and intended successor, Peter, she passed from the Lutheran to the Greek church, and took the name of Catharina Alexiowna. In 1745, her marriage took place. She soon quarreled with her husband, and each of them lived a life of unrestrained vice. Among his attendants was a count Soltikow, with whom her intimacy soon became scandalous; and Soltikow was sent on an embassy abroad. But the young Polish count, Stanislaus Poniatowski, almost immediately supplied his place. After the death of the empress Elizabeth in 1761, Peter III. ascended the Russian throne; but the conjugal difference became continually wider. C. was banished to a separate abode; and the emperor seemed to entertain the design of divorcing her, declaring her only son, Paul, illegitimate, and marrying his mistress, Elizabeth Woronzow. The popular dislike to Peter, however, rapidly increased; and at length, he being dethroned by a conspiracy, C. was made empress. A few days afterwards Peter was murdered (July, 1762). What participation his wife had in his murder, has never been well ascertained.

C. now exerted herself to please the people, and among other things, made a great show of regard for the outward forms of the Greek church, although her principles were, in reality, those of the infidelity then prevalent among the French philosophers. The government of the country was carried on with great energy; and her reign was remarkable for the rapid increase of the extent and power of Russia. Not long after her accession to the throne, her influence secured the election of her former favorite, Stanislaus Poniatowski, to the throne of Poland. In her own empire, however, discontentment

was seriously manifested, the hopes of the disaffected being centered in the young prince Ivan, who was forthwith murdered in the castle of Schlüsselburg. From that time, the internal politics of Russia long consisted in great part of intrigues for the humiliation of one favorite and the exaltation of another. The first partition of Poland in 1772, and the Turkish war, which terminated in the peace of Kainardji in 1774, vastly increased the empire. The Turkish war which terminated in the peace of Jassy in 1792, had similar results, and also the war with Sweden, which terminated in 1790. The second and third partitions of Poland, and the incorporation of Courland with Russia, completed the triumphs of C.'s reign. She began a war with Persia, however, and cherished a scheme for the overthrow of the British power in India; but a stroke of apoplexy cut her off on Nov. 9, 1796. She was a woman of great ability; but, utterly devoid of principle, she shrunk from no crime; and sensuality and ambition governed all her actions. She was shameless in vice; and always had a paramour, who dwelt in her palace, and might be regarded as filling an acknowledged office of state, with large revenues and determinate privileges. Yet distinguished authors flattered her; and she invited to her court some of the literati and philosophers of France. She was ever ready to commence great undertakings, but most of them were left unfinished; and little was really accomplished in her reign for the improvement of the country, or the progress of civilization. On a visit to the southern provinces of the empire in 1787, she was gratified by a perpetual display of fictitious wealth and prosperity along the whole route. This imperial progress was also a triumphal procession of her vile favorite Potemkin (q.v.).

CATHARINE DE' MEDICI, the queen of Henri II. of France, was the daughter of Lorenzo de' Medici, duke of Urbino, and was b. at Florence in 1519. In her 14th year she was brought to France, and married to Henri, the second son of Francis I. The marriage was a part of the political schemes of her uncle, pope Clement VII., but as he died soon after, she found herself friendless and neglected at the French court. In these circumstances, she conducted herself with a submission which seemed even to indicate a want of proper spirit, but which gained her the favor of the old king, and in some measure also of her husband. It was not till the accession of her eldest son, Francis II., in 1559, that her love of power began to display itself. The Guises at this time possessed a power which seemed dangerous to that of the throne, and C. entered into a secret alliance with the Huguenots to oppose them. On the death of Francis II. in 1560, and accession of Charles IX., the government fell entirely into her hands. Caring little for religion in itself, although she was very prone to superstition, she disliked the Protestants, chiefly because their principles were opposed to the absolute despotism which she desired to maintain. Yet she sought to rally the Protestant leaders around the throne, in order to remove the Guises. This attempt having failed, and the civil war which ensued having ended in the peace of Amboise, highly favorable to the Protestants, she became alarmed at the increase of their power, and entered into a secret treaty with Spain for the extirpation of heretics; and subsequently into a plot with the Guises, in which at first only the murder of the Protestant leaders was contemplated, but which resulted in the fearful massacre of St. Bartholomew's day. This event brought the whole power of the state into the hands of the queen-mother, who boasted of the deed to Roman Catholic governments, and excused it to Protestant ones, for she now managed all the correspondence of the court. About this time she succeeded, by gold and intrigues, in getting her third son, afterwards Henri III., elected to the Polish throne. But her arbitrary and tyrannical administration roused the opposition of a Roman Catholic party, at the head of whom was her own fourth son, the duke of Alençon, who allied themselves with the Protestants. It was very generally believed that she was privy to the machinations that led to his death. When, after the death of Charles IX., Henri III. returned from Poland to be king of France, his mother still ruled the court, and had the principal share in all the intrigues, treacheries, and political transactions of that woful period. Having betrayed all who trusted them, she and her son found themselves at last forsaken and abhorred by all. The league and the Guises had no more confidence in them, than had the Protestants and Henri of Navarre. Vexation on this account preyed on the proud heart of the queen-mother in her last days; and, amidst the confusion and strife of parties, she died at Blois, on 5th Jan., 1589, unheeded and unlamented. Her ruling passion was ambition, and to this she was ready to sacrifice everything. Her unprincipled policy had almost subverted the French monarchy; her extravagance and luxury exhausted the finances of the country. Her influence was powerful in increasing the demoralization of the court and of society. She unscrupulously employed beauties of her train to corrupt men whose power she feared.

CATHARINE OF ARAGON, Queen of England, the first wife of Henry VIII., and fourth daughter of Ferdinand and Isabella, king and queen of Castile and Aragon, was b. Dec., 1485. She occupies a prominent place in English history, not for what she herself was, but for what she was the occasion of—the reformation. Married when scarcely 16, to Arthur, prince of Wales, son of Henry VII., she was left a widow within a year; and in the course of a few months more a second marriage was projected for her by her father-in-law, with his second son Henry, as yet a boy of only 12 years old. The pope's dispensation enabling such near relatives to marry was

obtained in 1503, and the marriage took place in June, 1509, immediately after Henry's accession to the crown as Henry VIII. Although Henry was very far from being a model husband, he appears to have treated queen C., who had borne him several children, with all due respect, until about 1527, when he conceived a passion for Anne Boleyn (q. v.). He now expressed doubts as to the legality of his marriage, and set about obtaining a divorce. Pope Clement VII. would readily have annulled the marriage permitted by his predecessor, had he not feared queen C.'s powerful nephew, the emperor Charles V. He, however, granted a commission to Campeggio and Wolsey, to inquire into the validity of the marriage; but before these prelates queen C. refused to plead, and appealed to the pope. The king craved judgment. The legates cited the queen, and declaring her contumacious when she appeared not, went on with the cause; but the wily Campeggio, anxious only for time for his master when the king expected an answer, prorogued the court until a future day. The king consulted the universities of Europe, many of which declared the marriage invalid. The pope now summoned the king to Rome, but Henry haughtily refused to appear either himself, or by deputy, which he maintained would be to sacrifice the prerogatives of his crown; and setting the pope at defiance, married Anne Boleyn. Cranmer, shortly afterwards (1533), declared the first marriage void, and pope Clement annulled Cranmer's sentence, making the separation from Rome complete. Queen C. did not quit the kingdom, but took up her residence first at Amptill, in Bedfordshire, and afterwards at Kimbolton castle, Huntingdonshire, where she led an austere religious life until her decease in Jan., 1536. Queen C.'s personal character was unimpeachable, and her disposition sweet and gentle.

CATHARINE PARR, the sixth wife of Henry VIII., was the daughter of sir Thomas Parr, and was b. in 1512. Married first to lord Burgh, and afterwards to lord Latimer, she, in July 12, 1543, became queen of England by marriage with Henry VIII. She was distinguished for her learning and her knowledge of religious subjects, her discussion of which with the king had well-nigh brought her to the block, like so many of her predecessors. Her tact, however, saved her, and brought rebuke on her enemies; for she made it appear to the king's vanity, that she had only engaged him in discourse about the reformation, in order to derive profit from his majesty's speech. She persuaded Henry to restore the right of succession to his daughters, and interested herself on behalf of the universities. After Henry's death, she married, 1547, sir Thomas Seymour, and died the following year, not without suspicion of poison.

CATHARINE'S, ST., COLLEGE, or **HALL**, Cambridge, was founded by Robert Wode-larke, provost of King's college, 1473, for a master and three or more fellows. The visitors sent down to the university by Edward VI. ordered that there should be then six fellows, and in future a greater or less number as the revenues permitted. The statutes confirmed in May, 1860, provide that there shall be a master and nine fellows.

CATHARTES AURA, a vulture known as the turkey-buzzard, from its resemblance to the domestic turkey. Its home is in the southern Atlantic and gulf states, though it is sometimes found in the West Indies. The full-grown bird is 30 in. long, with a spread of wings of 6 ft., and the color black and brown. This greedy bird acts as the scavenger for southern cities, devouring refuse matter that might otherwise be injurious to the public health. For this purpose they are deemed so valuable that in some places their destruction is forbidden. There is a small species known locally as the carrion-crow.

CATHARTIC ACID, a very unstable colloid glucoside, black and uncrystallizable, which appears to be the active purgative principle of senna (q. v.).

CATHARTICS (Gr. *kathairō*, I purify), a name originally for all medicines supposed to purify the system from the matter of disease (*materies morbi*), which was generally presumed by the ancients to exist in all cases of fever and acute disease (see *CRISIS*), and to require to be separated or thrown off by the different excretions of the body. Ultimately, the term C. became limited in its signification to remedies acting on the bowels, which are popularly called *purgatives*—a mere translation of the Greek word. The principal C. are aloes, gamboge, colocynth, rhubarb, scammony, jalap, senna, Epsom, and other salts, and castor oil. Sulphur and cream of tartar forms a well-known mild laxative; magnesia is also useful in many cases of indigestion with acidity. Croton oil and elaterium belong to a more dangerous class of C., as also does the favorite remedy of the ancients—the black hellebore. The doses and use of the more ordinary remedies of this class are explained in all works on medicine. See *CONSTIPATION*.

CATHARTINE, or **BITTER OF SENNA**, is the essential principle in senna which possesses laxative or purgative properties. It can be isolated as a yellowish-red uncrystallizable solid, which is deliquescent, soluble in water and alcohol, insoluble in ether, has a very bitter nauseous taste, a characteristic odor, and possesses great purging powers, accompanied by nausea and griping. Three grains of C. are a full dose.

CATHAY. See *CHINA*.

CATHCART, Sir **GEORGE**, son of William, Earl Cathcart, was b. in London, 1794. Educated at Eton and Edinburgh, he, in 1810, joined the 2d life guards, and fought with the grand army in the campaigns of 1812 and 1813; and as aid-de-camp to the duke of Wellington, was present at Quatre Bras and Waterloo. In 1828, he was made lieut.

col., and served in British America and the West Indies for about 8 years; and in 1837 he proved himself an energetic and efficient officer in quelling the outbreak in Canada, where he remained for more than 6 years. In 1852, having held the appointment of deputy lieut. of the tower for some years, he was made governor of the Cape of Good Hope, with command of the forces, and in this capacity succeeded in bringing to a successful end the harassing Kafir war. He returned to England in time to be sent out to the Crimea as general of division. His bravery here was conspicuous, especially in the battle of Inkermann, where the odds were so terribly against the British forces, and where he was slain, Nov. 5, 1854. He was buried where he fell, and the place was named Cathcart's Hill after him. C. was the author of a very valuable work, entitled *Commentaries on the War in Russia and Germany in 1812 and 1813* (Lond. 1850).

CATHCART, WILLIAM SHAW, Earl, a British gen. and diplomatist, son of baron Cathcart of Cathcart, co. of Renfrew, was b. Sept. 17, 1755. Having studied at Glasgow, he entered the army, took a prominent part in the American war, and fought with distinction in Flanders and n. Germany. In 1801, he was made lieut. gen., and in 1803, commander-in-chief for Ireland. In 1805, he was engaged on a diplomatic mission to the czar Alexander. In July, 1807, he received the command of the land forces employed to co-operate with the fleet in the attack on Copenhagen, and, for his services in this capacity, was made a British peer, with the title of viscount, and received a vote of thanks from both houses of parliament, Jan. 28, 1808. In 1812, he was sent as ambassador to St. Petersburg, accompanied the czar Alexander in the campaigns of 1813 and 1814, and was present at the congresses of Chatillon and Vienna. He was raised to the rank of earl, June 18, 1814. The latter years of his life were chiefly spent at his country residence, Cartside, near Glasgow, where he died June 17, 1843.

CATHEAD. See CAT (on shipboard).

CATHEDRAL, from a Greek word *cathedra*, signifying a *seat*. Thus, "to speak *eo cathedrâ*," is to speak as from a *seat* of authority. The C. city is the seat of the bishop of the diocese, and his throne is placed in the C. church, which is the parish church of the whole diocese. The diocese was, in fact, anciently called *parochia*, until the application of this name to the smaller portions into which it was derived. A C. town has generally been understood to be entitled to the honors of a city, even although the town be not a borough incorporate; but in the case of Manchester, the claim was disallowed by a court of law. The distinction between C. and collegiate churches consists principally in the see of the bishop being at the former. The governing body of a C. is called the dean and chapter—i.e., the dean and canons who meet for corporate purposes in the chapter-house of the cathedral. The property of the C. vests in this body. They elect the bishop of the diocese on the issue of a *congé d'élire* from the crown, but as the person to be elected is always named, and they may be compelled by a mandamus to elect that person and no other, the election is merely a form.

The bishop is "visitor" of the dean and chapter. In England, by the act of 1840, all members of cathedrals, except the dean, are styled canons. Their *seat* in the C. is called their *stall*. They are no longer called prebends. Canons must reside 3 months in each year. The act allows to the canons of Durham, Manchester, St. Paul's, and Westminster, an income of £1000 per annum; to those of every other C. in England, £500. The bishop was always considered of common right to have the patronage of the canonries, but formerly there were exceptions. Now, the appointment to all canonries is vested either in the bishop, or in the crown. Where the bishop is patron, he "colates," and the dean and chapter "induct," by placing the new canon in a stall in the church. The crown appoints by letters-patent, and the canon is installed without collation. Honorary canons have no emoluments, but rank after the canons. Minor canons, of whom there are from 2 to 6 in each C., perform the daily choral services. The C. service is the usual church of England service intoned, with an anthem and the Psalms chanted. For the general plan of C. buildings, see CHURCH. The more remarkable cathedrals will be noticed under the names of the towns in which they are situated. In England and Wales the number of cathedrals is 34—the most famous for architectural beauty being those at Salisbury, Canterbury, Lincoln, Ely, Peterborough and York. An interesting series of papers on the English cathedrals from the pen of Mrs. Schuyler Van Rensselaer will be found in the *Century Magazine* for 1888-9.

History of Cathedrals.—As Christianity was first established chiefly in cities, the churches that grew up adjacent to them were, either originally or eventually, included in the diocese of the city bishop. Throughout the Roman empire the ecclesiastical divisions were the same as the civil, and the bishop's seat was placed in the same city with the governor's chair of state. From this point the transition was easy to the formal decree requiring that a C. as the seat of a bishop should be established in cities only. In Britain, however, where in the early days of Christianity cities were few and small, this rule could not be enforced. The bishop was over a district or tribe rather than a city, and naturally placed his seat where he found it most convenient and safe. Often he was compelled to remove it from one place to another. As the country became more settled this necessity ceased to exist, and at the close of the 11th century a law was passed requiring that the sees of bishops should be removed from villages to walled cities. In the early missionary work, especially of Britain, instead of beginning with a bishop,

companies of priests were organized, with the church as their center of work and the monastery as their home. After sufficient progress had been made, a bishop was appointed over them, and the church became a cathedral. The revival of missionary work by the church of England, at the beginning of the present century, led to a renewal of this system. The bishop followed the missionaries, and placed his seat in a church not originally designed for the honor. In colonial and foreign missionary work, within the last 25 years, there has been a return to the earlier plan. In the dioceses of Africa, New Zealand, and elsewhere, the bishop takes the lead in the date of his appointment as well as in rank, and his cathedral church is at once erected and manned. In this way the original design of such an establishment as described by bishop Stillingfleet is accomplished. "Every C., in its first institution, was as a temple to the whole diocese, where the worship was to be performed in the most decent and constant manner; for which end it was necessary to have such a number of ecclesiastical persons there attending as might still be ready to do all the offices which did belong to the Christian church—such as constant offering of prayer, singing, preaching, and administering sacraments—which were to be kept up in such a church as the daily sacrifice was in the temple." The bishop in his church was surrounded by his college of presbyters, of which he was the head, and the design of which was: 1. To strengthen him by wise counsel. 2. To maintain public worship with reverence and dignity. 3. To go forth at his command, as evangelists, whithersoever he might send them. In this way the chapter of the C. was established, originally in closest connection with the bishop, and having no corporate existence separate from him. It sometimes consisted of "secular clergy," who were not bound by monastic vows, and had separate homes of their own; and sometimes of "regulars," who were under monastic rule and lived in buildings common to all. Of both kinds of chapters the bishop was the head: of the latter, as the abbot of the monastery to which his cathedral church belonged; and of the former, as having sole authority over it. In early times, there was an arch-presbyter, who had chief authority among the cathedral clergy, always in strict subordination to the bishop. He was gradually supplanted by the archdeacon, who was followed in the 8th and 9th centuries by the "præpositus" or provost. The "dean," the present head of all English cathedral chapters, first appears in the 10th or 11th century. Gradually, as the bishop's diocesan duties increased and important political functions also were assigned him, he was obliged to leave the affairs of his C. to the head of the chapter, who consequently, in time, became the actual chief; and when the chapter was organized as an independent corporation, the bishop, seldom present, sank into a mere "visitor," called in occasionally to correct abuses or settle disputes. This is the explanation of the strange anomaly, witnessed in modern times, that in his own cathedral church, of which he is the titular head, and which is dignified by the presence of his seat, the bishop has less authority than in any other church of his diocese. Under the bishop as its *nominal* head, the chapter of a fully organized C., formed of secular priests, consisted of four chief dignitaries and a body of canons. I. The four high officers were: 1, the "dean," as the general head of the chapter charged with its internal discipline; 2, the precentor, presiding over the choir and musical arrangements; 3, the chancellor, who superintended the religious and literary instruction of the younger members, took care of the library, and wrote the letters; 4, the treasurer, to whom were intrusted, not the money of the church (as might appear from the modern use of the word), but its sacred vessels, altar-furniture, reliquaries, and similar treasures. II. In addition to these dignitaries, a cathedral chapter consisted of a board of officers called canons, because they were inrolled on the *list* and perhaps because they were subjected to the *rules*; some of them who enjoyed a separate estate (*præbenda*) in addition to their share of the corporate funds, were called prebendaries. A prebendary was always a canon, but a canon was not always a prebendary. Each canon had his own house and personal establishment. In the middle ages an attempt was made to impose on them, in part, monastic rules with dining-hall and lodging-rooms in common; but the restriction was never acceptable, and was gradually given up. Monastic cathedrals closely resembled other monasteries, except that in the almost constant absence of the bishop—their nominal abbot—they were governed by a prior. At the reformation the distinction between secular and monastic cathedrals was maintained under the titles of cathedrals of the old and new foundations.

In 1888, the following dioceses of the Protestant Episcopal church in the United States had cathedrals: Albany, Arkansas, Central Pennsylvania, Chicago, Colorado, Easton, Fond du Lac, Georgia, Iowa, Kansas, Long Island, Maine, Minnesota, Nebraska, Northern Texas, Quincy, Tennessee, Utah, Western Texas, Wisconsin; and funds are now being raised towards the erection of noble C. buildings in New York city for the diocese of New York. The finest specimen of cathedral architecture at present existing in this country is found in St. Patrick's Roman Catholic cathedral, in New York city, begun in 1858 and practically completed in 1889, at a cost of some \$2,500,000.

The most imposing and magnificent Gothic cathedral in the world is that at Cologne, begun in 1248. Other noble structures are the Duomo in Florence, the Cathedral at Milan, Strasburg cathedral, Notre Dame at Paris, and the Ulm cathedral, the last having the highest spire in the world; completed in 1890. The cathedral church of the Pope is not, as is generally supposed, St. Peter's, but the church of St. John Lateran.

CATHELINEAU, JACQUES, general of the army in La Vendée, in the w. of France, was b. Jan. 5, 1759, in very humble life, at Pin-en-Mauges, in lower Anjou. Horrified at the atrocities and despotic acts of the convention, he placed himself in opposition to

It, and soon collected around him a body of loyal peasantry, whom he led against and defeated the republicans in several conflicts. After the victory of Saumur (q.v.), the council of generals appointed him, as having the greatest influence over his countrymen, commander-in-chief. He immediately determined to make an attack upon Nantes, and managed to penetrate into the town, where he was wounded by a musket-ball, and his troops immediately dispersed. He was carried to St. Florent, where he died July 11, 1793. He was a man of great simplicity and honesty of character, and his piety was such, that he was called the saint of Anjou.

CATHERINE OF BRAGANZA, 1638-1705; queen of Charles II. of England, daughter of John, duke of Braganza, the rightful heir to the throne of Portugal, then under Spanish rule. John headed the revolt of 1640, and after years of fighting succeeded in reaching his throne. The mother of Catherine was a woman of ability, and governed Portugal for several years after the death of her husband. She foresaw the coming restoration in England, and proposed the marriage of Catherine with Charles mainly to gain a powerful ally against Spain. The latter power vainly tried to prevent the marriage, and when it was agreed upon, Portugal promised a dowry of £500,000, and the towns of Tangier and Bombay (the latter being the first of the now enormous English possessions in the east), besides many privileges of trade. On the marriage at Plymouth, May 13, 1663, Charles appeared to be well pleased with his bride; but the union proved unhappy. Catherine had been brought up in a convent, and had none of the manners required by the most fashionable and profligate court of Europe. The chief trouble, however, was the heartless and shameless profligacy of her husband, who brought his mistresses into the court, and, when the queen expressed her indignation at the insult, lectured her upon the duty of submission. After repeated humiliations of this kind, the queen's spirit was broken, and alienation naturally followed. As she was a Roman Catholic, she was an object of suspicion outside of the court, and her name was subjected to calumny. The only satisfaction she could experience in her unfortunate connection was the great aid rendered by England against Spain in the struggle of her native power with that kingdom. After a life of entire seclusion during the reign of James II. and the first years of William III., she returned to Portugal in 1692, where, for a time before her death, she acted in capacity of regent to her brother, Don Pedro. She had no children.

CATHERINE FIESCHI ADORNO, SAINT, 1447-1510; a daughter of the viceroy of Naples, who, at the age of 13, devoted herself to a religious life, but three years later, in obedience to parental desire, married Julian Adorno, a gay young nobleman of Genoa—a reckless fellow, who spent her fortune and gave her a life of misery for many years. After his death she became mother-superior in the hospital, and extended her care to the sick throughout the city. She wrote several works, two of which, *Purgatory*, and *Dialogue Between the Soul and the Body*, are evidently records of her own experience. She was canonized in 1737. In her, a piety contemplative, mystical, and almost ecstatic, had an accompaniment not always found of active beneficence.

CATHERINE OF VALOIS, or OF FRANCE, 1401-37; Queen of Henry V. of England. She was unfortunate in her childhood, her father, Charles VI. of France, being subject to prolonged fits of insanity, while her mother—who was one of the most abandoned women of the time—neglected her children to such an extent that they were often without suitable food or clothing. She was at last taken away from her mother and educated in a convent. When she was only 12 years old, Henry asked her hand in marriage, coupling the proposal with a demand for a large dowry in money, and the restitution to England of the French provinces once held by the English crown. The proposition was indignantly rejected, and Henry soon afterwards invaded France and asserted his claims in a manner that was not to be resisted. All his claims were admitted, and when he married Catherine at Troyes in 1420 he received immediate possession of the provinces claimed, the regency of France during the life of the father-in-law, and the reversion of the sovereignty after the death of Charles. In 1421, Catherine was crowned at London, and in Dec. of that year she became the mother of Henry VI. The next year she was in France, where her husband died, and she returned to London with the funeral cortège; but after the funeral little is heard of her history, the only notable event being her secret marriage to Owen Tudor, the heir of a princely house in Wales, who had distinguished himself for bravery at Agincourt. His position in England, however, was low, and the marriage was long kept secret—a necessity that caused Catherine much vexation and probably hastened her death. Her son by Tudor was made earl of Richmond, and married Margaret Beaufort, heiress of the house of Somerset, and junior representative of the branch of John of Gaunt, and she became the mother of Henry VII., and consequently the ancestress of the Tudor line of English kings.

CATHERINE-WHEEL is a device which is frequently used as a charge in coats of arms, when it is represented with teeth. See also **PYROTECHNY**.

CATHETER (Gr. *kathienai*, to thrust into) was a name applied indifferently to all instruments used for passing along mucous canals. In modern times, however, it has generally been reserved for tubular rods through which fluids or air may pass, and which may give free exit to the accumulated contents of such organs as the urinary bladder. The

C. for the latter purpose is a very old surgical instrument. The ancients made theirs of copper, which accumulated verdigris. In the 9th c. silver was substituted by the Arabian surgeons as a cleaner metal, and is still used by all who are not obliged, for economical reasons, to have their catheters made of German silver or pewter. The urinary C. for the male varies in length from 10 to 11 in.; the female C. need not be more than 4 or 5 inches. The form is a matter of indifference, but most surgeons prefer an instrument straight to within the last few inches of its length; the latter should be curved into the segment of a small circle. Others, however, use a double curve, and, indeed, nearly every surgeon has a peculiar fancy in this respect.

Flexible catheters are made of gum elastic, which may be used either alone or supported on a wire. Many other materials have been proposed. Of late years, vulcanized rubber has been very generally employed.

CATHODE RAYS. See PHOTOGRAPHY; ROENTGEN.

CATHOLIC AND APOSTOLIC CHURCH, the title of a body of Christians generally but improperly known as Irvingites (q. v.).

CATHOLIC CHURCH. The term catholic literally signifies *universal*. The phrase C. C. is therefore equivalent to "universal church," and cannot properly be applied to any particular sect or body, such as the Roman, Anglican, Genevan, Reformed Lutheran, or Presbyterian, all of which form merely portions more or less pure of the "church universal." It was first employed to distinguish the Christian church from the Jewish; the latter being restricted to a single nation, whereas the former was intended for the world in general. Afterwards, it served to mark the difference between the orthodox Christian church and the various sects which sprang from it, such as the Cerinthians, Basilidians, Arians, Macedonians, etc. The name has been retained by the church of Rome, which was the visible successor of the primitive one; and although Protestant divines have been careful to deny its applicability to a church which they consider buried under the corrupt accretions of centuries, yet the term catholic is still used by the populace of almost every Protestant country as synonymous with Roman Catholic, so that from their minds all conception of the literal meaning of the word has vanished. For an account of the church of Rome, see art. ROMAN CATHOLIC CHURCH.

CATHOLIC, or UNITED COPTS, a body of about 10,000 native Egyptians who acknowledge the authority of the pope of Rome. In 1855, one of their priests was appointed vicar apostolic and bishop *in partibus*.

CATHOLIC CREDITOR, in the law of Scotland, is one whose debt is secured over several or the whole subjects belonging to the debtor—e.g., over two or more heritable estates for the same debt. The C. C. is bound so to exercise his right as not unnecessarily to injure the securities of the other creditors. Thus, if he draw his whole debt from one of the subjects, he must assign his security over the others to the postponed creditors.

CATHOLIC (ROMAN) EMANCIPATION ACT (10 Geo. IV. c. 7). To render this famous measure intelligible, and still more to convey a conception of its importance to younger readers, it is necessary that we should preface our account of it by a slight sketch of the position of Roman Catholics in Great Britain, before it was passed. From first to last, the sufferings of the Roman Catholics were the fruit of political tyranny quite as much as of religious rancour or fanaticism, and their release was effected by a change in the political rather than in the religious views or feelings of the dominant party. The first occasion on which even a promise of a different line of policy from that which had been originally adopted was held out to the Roman Catholics of Ireland, was on the termination of the revolutionary war in 1691; and had king William been able to carry out the views which his personal enlightenment and liberality dictated, it is probable that Catholic emancipation would have been hastened by more than a century. But the English parliament, which was intensely anti-Roman Catholic, enacted, on the 22d of Oct. 1691, that Irish members of both houses should take the oaths of supremacy; and three years later, a set of acts were passed, which placed the Roman Catholics in a worse position than at any previous period of their history. The whole population was disarmed, and the priests banished from the country. But what must have been still more intolerable, was the interference with the private arrangements of their families. All Roman Catholics were prohibited from acting as guardians not only to Protestant but to Catholic children. At a somewhat later date (1704), it was enacted that if a son chose to turn Protestant, he should be entitled to dispossess his father, and at once to take possession of the family estate. Though Catholics were not directly declared incapable of holding land, they were deprived of the right of acquiring it by purchase, or even by long lease; and if a Catholic chanced to occupy a place in a line of entail, he was passed over in favor of the next Protestant heir. No office of trust, civil or military, was now open to a Catholic; he was forbidden to vote at elections, to intermarry with a Protestant, or even to dwell in Limerick or Galway, except under certain conditions. But perhaps the most demoralizing provision of all, was that which empowered the son of a Catholic to bring his father into chancery, to force him to declare on oath the value of his property, and to settle such an allowance on him as the court should determine, not only for the father's life, but the son's.

Amongst the other burdens of this heavy time, may be mentioned the exclusion of Catholics from the profession of the law, and the regulation that if a Protestant lawyer married a Catholic, he should be held to have gone over to her faith: the prohibition against Catholics acting as schoolmasters, under the penalty of being prosecuted as convicts, by which the whole body was virtually excluded from the benefits of education; and the still more summary enactment, that if a priest celebrated marriage between a Protestant and a Catholic, he should be hanged. But as years passed away, the memory of the foul deeds of the inquisition and the confessional, and of the other enormities of which Roman Catholics had been guilty in their days of power, waxed fainter; milder feelings began to prevail; and when Grattan appeared as the champion of their rights, the field was already in some degree prepared for his labors. Favored by such influences, of which no one knew better how to avail himself, he succeeded, in 1780, in carrying, in the Irish parliament, the famous resolution, "that the king's most excellent majesty, and the lords and commons of Ireland, are the only competent power to make laws to bind Ireland." Many of the disqualifying statutes were now repealed, and the claim for complete equality with Englishmen and Protestants, or complete separation from the sister-country, was now formally urged. From this period to the final liberation was achieved, there was no rest. The Irish rebellion of 1798 brought home to the English nation the dangers to which it would constantly be exposed till the question was finally adjusted. The act of union of 1800 was the immediate consequence of that outbreak; and to this act the Irish were induced to consent by a virtual pledge entered into by Mr. Pitt, to the effect that the Catholic disabilities should be at once removed. But, like William of Orange, Pitt had pledged himself to more than he was able to accomplish. The king was seized with scruples regarding the obligations imposed upon him by his coronation oath, and made a vigorous stand against the proposals of his minister.

At a subsequent period, efforts were made in the direction of emancipation by Mr. Canning and Lord Castlereagh. About 1824, the press began to take up the question warmly; a Catholic association was formed, to prepare petitions to parliament; the Irish priests stimulated their flocks to subscribe for the purposes of agitation; O'Connell rapidly became a power; and as early as March, 1825, the importance of the question was so deeply felt, that sir F. Burdett ventured to introduce a relief bill, which passed the commons by a majority of 268 to 241, but was rejected by the lords. A slight temporary reaction now took place, the superstitious fears of ignorant Protestants being excited by a "no-papery" cry, and in consequence, a new relief bill, introduced in 1827, though supported by the last effort of Canning's eloquence, was lost in the commons by a majority of 4. But the liberal view of the Roman Catholic claims was essentially the popular one—at least among the enlightened classes; and as a proof of this, under the hostile administration of the duke of Wellington, the very same resolution which had lost in 1827 by a minority of 4, was carried in 1828 by a majority of 6. The duke himself now began to waver in opinion, so that the beginning of the end was manifestly near. During O'Connell's famous canvass for the county of Clare, the duke declared in the house of lords, "if the public mind were now suffered to be tranquil, if the agitators of Ireland would only leave the public mind at rest, the people would become more satisfied, and I certainly think it would then be possible to do something." O'Connell's return for Clare, notwithstanding the existence of the oaths which precluded him from taking his seat in the house, and the events which now followed in quick succession, made it clear that the "something" of which the duke had spoken must be the passing of the emancipation bill in the ensuing session. The king's speech, which was read on the 5th Feb. of the following year, accordingly contained a recommendation to parliament, to consider whether the civil disabilities of the Catholics could not be removed, "consistently with the full and permanent security of our establishments in church and state."

On the 5th Mar., Mr. Peel brought forward the great measure. The majority on the motion in the commons for going into committee was 188, in a house of 508 members; the debate on the second reading issued in a majority of 180; and the final majority, after the bill had passed through committee, in which not one of the many amendments proposed was carried, was 178 in a house of 462. In the lords, the debate lasted three nights, the majority being 106 in favor of the second reading of a bill which, nine months before, the same house had refused, by a majority of 45, even to entertain—so rapid and threatening had been the progress of the agitation. On the 13th April, 1829, this famous measure became the law of the land. It now only remains that, by mentioning the provisions of the act, we sum up the results of one of the most important controversies that ever agitated the inhabitants of this country. For the oath of supremacy, another oath was substituted, by which all Catholic members of parliament bound themselves to support the existing institutions of the state, and not to injure those of the church. Catholics were admitted by the same act to all corporate offices, and to an equal enjoyment of all municipal rights. The army and navy had already been opened to them. On the other hand, they were excluded from the offices of regent, of chancellor of England or Ireland, and of viceroy of Ireland; from all offices connected with the church, its universities and schools, and from all disposal of church patronage. The most important security related to the franchise, in which a £10 was substituted for a 40s. qualification in Ireland. The clergy of the R. C. church were left

in the position of other dissenters, the government having declined either to endow them, or to introduce any machinery for prying into their relations to the pope. But the public use of their insignia of office, and of episcopal titles and names, was denied them; the extension of monachism was prohibited.

CATHOLIC EPISTLES, the name given, according to Clemens Alexandrinus and Origen, to certain epistles, addressed not to particular churches or individuals, but either to the church universal or to a large and indefinite circle of readers. Originally, the C. E. comprised only the first epistle of John and the first of Peter, but, at least as early as the 4th c. (as evinced by the testimony of Eusebius), the term was applied to all the apostolic writings used as "lessons" in the orthodox Christian churches. But this included the epistle of James, of Jude, the 2d of Peter, and the 2d and 3d of John. These seven thus constituted the C. E., although the genuineness and authenticity of the last-mentioned five were not universally acknowledged; but this very incorporation with epistles whose canonicity was not questioned, naturally had the effect of confirming their authority, so that in a short time the entire seven came to be considered a portion of the canon.

CATHOLIC MAJESTY, HIS MOST. One of the formal designations of the King of Spain.

CATHOLICS, OLD. See OLD CATHOLICS.

CATHOLICOS, the title of the patriarchs or chief ecclesiastics in the hierarchy of the Armenian church, and of the Christians of Georgia and Mingrelia.

CATHOLICS, ROMAN. See ROMAN CATHOLIC CHURCH.

CATILINA, LUCIUS SERGIUS, descended from a patrician but impoverished family, was b. about the year 108 B.C. During his youth, he attached himself to the party of Sulla. His bodily constitution, which was capable of enduring any amount of labor, fatigue, and hardship, allied to a mind which could stoop to every baseness and feared no crime, fitted him to take the lead in the conspiracy which has made his name infamous to all ages. In the year 68 B.C., he was elected prætor; in 67 B.C., governor of Africa; and in 66 B.C., he desired to stand for the consulship, but was disqualified on account of the accusations brought against him of maladministration in his province. Disappointed thus in his ambition, and burdened with many and heavy debts, he saw no hope for himself but in the chances of a political revolution, and therefore entered into a conspiracy, including many other young Roman nobles, in morals and circumstances greatly like himself. The plot, however, was revealed to Cicero by Fulvia, mistress of one of the conspirators. Operations were to commence with the assassination of Cicero in the Campus Martius, but the latter was kept aware of every step of the conspiracy, and contrived to frustrate the whole design. In the night of Nov. 6 (63 B.C.), Catiline assembled his confederates, and explained to them a new plan for assassinating Cicero; for bringing up the Tuscan army (which he had seduced from its allegiance), under Manlius, from the encampment at Fesulæ; for setting fire to Rome, and putting to death the hostile senators and citizens. In the course of a few hours, everything was made known to Cicero. Accordingly, when the chosen assassins came to the house of the consul, on pretense of a visit, they were immediately repulsed. On the 8th of Nov., Catiline audaciously appeared in the senate, when Cicero—who had received intelligence that the insurrection had already broken out in Etruria—commenced the celebrated invective beginning: *Quousque tandem abutere, Catilina, patientia nostra?* etc. ("How long now, Catiline, will you abuse our patience?") The scoundrel was abashed, not by the keenness of Cicero's attack, but by the minute knowledge he displayed of the conspiracy. His attempt at a reply was miserable, and was drowned in cries of execration. With curses on his lips, he abruptly left the senate, and escaped from Rome during the night. Catiline and Manlius were now denounced as traitors, and an army under the consul, Antonius, was sent against them. The conspirators who remained in Rome, the chief of whom was Lentulus, were arrested, tried, condemned, and executed, Dec. 5. The insurrections in several parts of Italy were meanwhile suppressed; many who had resorted to Catiline's camp in Etruria, deserted when they heard what had taken place in Rome, and his intention to proceed into Gaul was frustrated. In the beginning of Jan. (62), he returned by Pistoria (now Pistoja) into Etruria, where he encountered the forces under Antonius, and, after a desperate battle, in which he displayed almost superhuman courage and enthusiasm, was defeated and slain. The appearance of Catiline was in harmony with his character. He had a daring and reckless look; his face was haggard with a sense of crime; his eyes were wild and bloodshot, and his step unsteady, from nightly debauchery. The history of the Catiline conspiracy is given by Sallust in a remarkably concise and nervous style.

CATI-NEAU-LAROCHE, PIERRE MARIE SÉBASTIEN, 1772-1828; a French philologist who emigrated to San Domingo, where his antislavery sentiments were so obnoxious that he was prosecuted and saved from death only by the interference of the home government. He went to Cape Haytien, where in the great massacre he alone of 17 Frenchmen was saved. He returned to Paris by way of the United States, set up a printing-office, and produced several dictionaries. In 1819, he was sent by the government to study the climate of French Guiana.

CAT ISLAND. See **BAHAMAS.**

CATKIN, *Amentum*, in botany, a spike of numerous, small, unisexual flowers, destitute of calyx and corolla, and furnished with scale-like bractæ instead, the whole inflorescence finally falling off by an articulation in a single piece. Examples are found in the willow, hazel, oak, birch, alder, and other trees and shrubs, forming the natural order amentaceæ (q.v.). In some, as in the oak and hazel, the male flowers only are in catkins.

CATLIN, GEORGE, 1796-1872; b. Penn.; an artist celebrated for his travels, writings, and portraits of American Indians. He was bred to the law and practiced for a year or two in Philadelphia, but having a taste for art he established himself in New York as a portrait-painter. About 1832, he became impressed with the fact, that the most remarkable American Indians were fast disappearing, and resolved to rescue at least the portraits of some of them from oblivion. In pursuit of this object he traveled and dwelt among the aboriginal tribes in North and South America, acquiring their languages, and thoroughly studying their manners and customs, traditions, history, and modes of life. After collecting many portraits, and many sketches of life and scenery, he published in London, in 1841, a large work on the *Manners, Customs, and Condition of the North American Indians*, with 800 illustrations. In 1844, followed the *North American Portfolio of Hunting Scenes*; in 1848, *Eight Years' Travels and Residence in Europe*, in which he gives the stories of several Indians whom he had introduced to various European courts. In 1864, he published a little monograph which created much interest among medical men, entitled *The Breath of Life*, in which he argued the importance of keeping one's mouth closed when sleeping—an idea doubtless suggested by the fact that the Indians use special care in this respect. His last work was *Last Rambles among the Indians of the Rocky Mountains and the Andes*.

CATMANDOO, **KATMANDU**, or **KHATMANDU**. See **NEPAUL**.

CATMINT, *Nepeta cataria*, a plant of the natural order *labiata*, pretty common in England, in chalky and gravelly soils, but rare in Scotland and Ireland, widely diffused throughout Europe and the middle latitudes of Asia, and of North America; remarkable for the fondness which cats display for it. It appears to act upon them in a similar way to valerian root; and when its leaves are bruised so as to be highly odoriferous, they are at once attracted to it, rub themselves on it, tear at it, and chew it. Its odor has been described as intermediate between that of mint and that of pennyroyal. It has erect stems, 2 to 3 ft. high, dense whorls of many whitish flowers, tinged and spotted with rose-color, and stalked heart-shaped leaves of a velvety softness, whitish and downy beneath.—Other species are numerous in the s. of Europe, and middle latitudes of Asia.

CATNIP. See **CATMINT**.

CATO, **DIONYSIUS**, is the name prefixed to a little volume of moral precepts in verse, which was a great favorite during the middle ages. Whether or not such a person ever existed, is a point of the greatest uncertainty. The title which the book itself commonly bears, is *Dionysii Catonis Disticha de Moribus ad Filium*. Its contents have been differently estimated: some scholars have considered the precepts admirable; others, weak and vapid: some have found indications of a superior scriptural knowledge; others, of a deep-rooted paganism. The style has been pronounced the purest Latin and the most corrupt jargon. The truth would seem to be, that on a ground-work of excellent Latin of the silver age, the illiterate monks of a later period have, as it were, inwoven a multitude of their own barbaric errors, which preclude us from determining precisely the period when the volume was composed. It begins with a preface addressed by the supposed author to his son, after which come 56 injunctions of rather a simple character, such as *parentem ama*. This is followed by the substance and main portion of the book—viz., 144 moral precepts, each of which is expressed in two dactylic hexameters. During the middle ages, the *Disticha* was used as a text-book for young scholars. In the 15th c., more than 30 editions were printed. The best edition, however, is that published at Amsterdam in 1754 by Otto Arntzenius. Caxton translated it into English.

CATO, **MARCUS PORCIUS**, surnamed *Censorius* and *Sapiens* ("the wise"), afterwards known as **CATO PRISCUS** or **CATO MAJOR**—to distinguish him from Cato of Utica—was b. at Tusculum in 234 B.C. He inherited from his plebeian father a small farm in the country of the Sabines, where he busied himself in agricultural operations, and learned to love the simple and severe manners of his Roman forefathers, which still lingered round his rural home. Induced by Lucius Valerius Flaccus to remove to Rome when that city was in a transition epoch, from the old-fashioned strictness and severe frugality of social habits, to the luxury and licentiousness of Grecian manners, C. appeared to protest against this, to denounce the degeneracy of the Philo-hellenic party, and to set a pattern of sterner and purer character. He soon distinguished himself as a pleader at the bar of justice, and after passing through minor offices, was elected consul. In his province of Nearer Spain, where an insurrection had broken out after the departure of the elder Scipio (206 B.C.), C. was so successful in quelling disturbances and restoring order, that in the following year he was honored by a triumph. C. exhibited extraordinary military genius in Spain; his stratagems were brilliant, his plans of battle were

marked by great skill, and his general movements were rapid, bold, and unexpected. In 187 B.C., a fine opportunity occurred for the display of "antique Roman" notions. M. Fulvius Nobilior had just returned from Ætolia victorious, and sought the honor of a triumph. C. objected. Fulvius was indulgent to his soldiers, a man of literary taste, etc., and C. charges him, among other enormities, with "keeping poets in his camp." These rude prejudices of C. were not acceptable to the senate, and C.'s opposition was fruitless. In 184 B.C., C. was elected censor, and discharged so rigorously the duties of his office, that the epithet *Censorius*, formerly applied to all persons in the same station, was made his permanent surname. Many of his acts were highly commendable. He repaired the water-courses, paved the reservoirs, cleansed the drains, raised the rents paid by the publicans for the farming of the taxes, and diminished the contract prices paid by the state to the undertakers of public works. More questionable reforms were those in regard to the price of slaves, dress, furniture, equipage, etc. His despotism in enforcing his *own* idea of decency may be illustrated from the fact, that he degraded Manilius, a man of prætorian rank, for having kissed his wife in his daughter's presence in open day. C. was a thoroughly dogmatic moralist, intolerant, stoical, but *great*, because he manfully contended with rapidly swelling evils; yet not *wise*, because he opposed the bad and the good in the innovations of his age with equal animosity.

In the year 175 B.C., C. was sent to Carthage to negotiate on the differences between the Carthaginians and the Numidian king Masinissa; but having been offended by the Carthaginians, he returned to Rome, where, ever afterwards, he described Carthage as the most formidable rival of the empire, and concluded all his addresses in the senate-house—whatever the immediate subject might be—with the well-known words: "*Ceterum censeo, Carthaginem esse delendam*" ("For the rest, I vote that Carthage must be destroyed").

Though C. was acquainted with the Greek language and its literature, his severe principles led him to denounce the latter as injurious to national morals. He died 149 B.C., at the age of 85. C. was twice married. In his eightieth year, his second wife, Salonia, bore him a son, the grandfather of Cato of Utica. C. treated his slaves with shocking harshness and cruelty. In his old age, he became greedy of gain, yet never once allowed his avarice to interfere with his honesty as a state-functionary. He also composed various literary works, such as *De Re Rustica* (a treatise on agriculture)—much corrupted, however. The best editions are by Gesner and Schneider in their *Scriptores Rei Rusticæ*. His greatest historical work, *Origines*, has, unfortunately, perished; but some few fragments are given in Krause's *Historicorum, Romanorum Fragmenta* (Berlin, 1833). Fragments of C.'s orations—of which as many as 150 were read by Cicero—are given in Meyer's *Oratorum Romanorum Fragmenta* (Zürich, 1842).

CATO, MARCUS PORCIUS, named CATO THE YOUNGER, or CATO UTICENSIS (from the place of his death), was born 95 B.C. Having lost, during childhood, both parents, he was educated in the house of his uncle, M. Livius Drusus, and, even in his boyhood, gave proofs of his decision and strength of character. In the year 72 B.C., he served with distinction in the campaign against Spartacus, but without finding satisfaction in military life, though he proved himself a good soldier. From Macedonia, where he was military tribune in 67, he went to Pergamus in search of the Stoic philosopher, Athenodorus, whom he brought back to his camp, and whom he induced to proceed with him to Rome, where he spent the time partly in philosophical studies, and partly in forensic discussions. Desirous of honestly qualifying himself for the quæstorship, he commenced to study all the financial questions connected with it. Immediately after his election, he introduced, in spite of violent opposition from those interested, a rigorous reform into the treasury offices. He quitted the quæstorship at the appointed time amid general applause. In 63 B.C., he was elected tribune, and also delivered his famous speech on the Catiline conspiracy, in which he denounced Cæsar as an accomplice of that political desperado, and determined the sentence of the senate. Strongly dreading the influence of unbridled greatness, and not discerning that an imperial genius—like that of Cæsar—was the only thing that could remedy the evils of that overgrown monster, the Roman republic, he commenced a career of what seems to us blind pragmatic opposition to the three most powerful men in Rome—Crassus, Pompey, and Cæsar. C. was a noble but strait-laced *theorist*, who lacked the intuition into circumstances which belongs to men like Cæsar and Cromwell. His first opposition to Pompey was successful; but his opposition to Cæsar's consulate for the year 59 not only failed, but even served to hasten the formation of the first triumvirate between Cæsar, Pompey, and Crassus. He was afterwards forced to side with Pompey, who had retired from his connection with Cæsar, and become reconciled to the aristocracy. After the battle of Pharsalia (48 B.C.), C. intended to join Pompey, but hearing the news of his death, escaped into Africa, where he was elected commander by the partisans for Pompey, but resigned the post in favor of Metellus Scipio, and undertook the defense of Utica. Here, when he had tidings of Cæsar's decisive victory over Scipio at Thapsus (April 6, 46 B.C.), C., finding that his troops were wholly intimidated, advised the Roman senators and knights to escape from Utica, and make terms with the victor, but prohibited all intercessions in his own favor. He resolved to die rather than surrender, and, after spending the night in reading Plato's *Phædo*, committed suicide by stabbing himself in the breast.

CAT'ODON and CATODON'TIDÆ. See CACHOLOT.

CAT-O'-NINE-TAILS. See FLOGGING.

CATOO'SA, a co. in n.w. Georgia, watered by affluents of the Tennessee river, and crossed by the Western and Atlantic railroad; 149 sq.m.; pop. '90, 5431, incl. colored. The region is hilly, with much woodland. The productions are chiefly agricultural. Co. seat, Ringgold.

CATOP'TRICS. The divisions of the science of optics are laid out and explained in the article OPTICS (q.v.). C. is that subdivision of geometrical optics which treats of the phenomena of light incident upon the surfaces of bodies, and reflected therefrom. All bodies reflect more or less light, even those through which it is most readily transmissible; light falling on such media, for instance, at a certain angle, is totally reflected. Rough surfaces scatter or disperse (see DISPERSION of LIGHT) a large portion of what falls on them, through which it is that their peculiarities of figure, color, etc., are seen by eyes in a variety of positions; they are not said to *reflect* light, but there is no doubt they do, though in such a way, owing to their inequalities, as never to present the phenomena of reflection. The surfaces with which C., accordingly, deals, are the smooth and polished. It tracks the course of *rays* and *pencils* of light after reflection from such surfaces, and determines the positions, and traces the forms, of images of objects as seen in mirrors of different kinds.

A ray of light is the smallest conceivable portion of a stream of light, and is represented by the line of its path, which is always a straight line. A pencil of light is an assemblage of rays constituting either a cylindrical or conical stream. A stream of light is called a converging pencil when the rays converge to the vertex of the cone, called a focus; and a diverging pencil, when they diverge from the vertex. The axis of the cone in each case is called the axis of the pencil. When the stream consists of parallel rays, the pencil is called cylindrical, and the axis of the cylinder is the axis of the pencil. In nature, all pencils of light are primarily diverging—every point of a luminous body throwing off light in a conical stream; converging rays, however, are continually produced in optical instruments, and when light diverges from a very distant body, such as a fixed star, the rays from it falling on any small body, such as a reflector in a telescope, may, without error, be regarded as forming a cylindrical pencil. When a ray falls upon any surface, the angle which it makes with the normal to the surface at the point of incidence is called *the angle of incidence*; and that which the reflected ray makes with the normal, is called *the angle of reflection*.

Two facts of observation form the ground-work of catoptrics. They are expressed in what are called the laws of reflection of light: 1. In the reflection of light, the incident ray, the normal to the surface at the point of incidence, and the reflected ray, lie all in one plane. 2. The angle of reflection is equal to the angle of incidence. These laws are simple facts of observation and experiment, and they are easily verified experimentally. Rays of all colors and qualities follow these laws, so that white light, after reflection, remains undecomposed. The laws, too, hold, whatever be the nature, geometrically, of the surface. If the surface be a plane, the normal is the perpendicular to the plane at the point of incidence; if it be curved, then the normal is the perpendicular to the tangent plane at that point. From these laws and geometrical considerations may be deduced all the propositions of catoptrics. In the present work, only those can be noticed whose truth can in a manner be exhibited to the eye, without any rigid mathematical proof. They are arranged under the heads *plane surfaces* and *curve surfaces*.

Plane Surfaces.—1. When a pencil of parallel rays falls upon a plane mirror, the reflected pencil consists of parallel rays. A glance at the annexed figure (fig. 1),

Fig. 1.

Fig. 2.

Fig. 3.

where PA and QB are two of the incident rays, and are reflected in the directions AR and BS respectively, will make the truth of this pretty clear to the eye. The proposition, however, may be rigidly demonstrated by aid of Euclid, book xi., with which, however, we shall not presume the reader to be acquainted. The reader may satisfy himself of its truth practically by taking a number of rods parallel to one another and inclined to the floor, and then turning them over till they shall again be equally inclined to the floor, when he will again find them all parallel.—2. If a diverging or converging pencil is incident on a plane mirror, the focus of the reflected pencil is situated on the opposite side of the mirror to that of the incident pencil, and at an equal distance from it. Suppose the pencil to be diverging from the focus Q (fig. 2), on the

mirror of the surface of which CB is a section. Draw QNq perpendicular to CB and make $qN=QN$, the q is the focus of the reflected rays. For let QA, QB, QC be any of the incident rays in the plane of the figure; draw the line AM perpendicular to CB, and draw AR, making the angle MAR equal to the angle of incidence, MAQ. Then AR is the reflected ray. Join qA. Now it can be proved geometrically, and indeed is apparent at a glance, that qA and AR are in the same straight line; in other words, the reflected ray AR proceeds as if from q . In the same way, it may be shown that the direction of any other reflected ray, as BS, is as if it proceeded from q ; in other words, q is the focus of reflected rays; it is, however, only their *virtual* focus. See art. Focus. If a pencil of rays converged to q , it is evident that they would be reflected to Q as their real focus, so that a separate proof for the case of a converging pencil is unnecessary. The reader who has followed the above will have no difficulty in understanding how the position and form of the image of an object placed before a plane mirror—as in fig. 3, where the object is the arrow AB, in the plane of the paper, to which the plane of the mirror is perpendicular—should be of the same form and magnitude as the object (as ab in the fig.), and at an equal distance from the mirror, on the opposite side of it, but with its different parts inverted with regard to a given direction. The highest a , for instance, in the image, corresponds with the lowest point, A, in the object. He will also understand how, in the ordinary use of a looking-glass, the right hand of the image corresponds to the left hand of the object.

When two plane mirrors are placed with their reflecting surfaces towards each other, and parallel, they form the experiment called the endless gallery. Let (in fig. 4) the arrow, Q, be placed vertically between the parallel mirrors, CD, BA, with their silvered faces turned to one another, Q will produce in the mirror CD the image q^1 . This image will act as a new object to produce with the mirror BA the image q^2 , which, again, will produce with the mirror CD another image, and so on. Another series of images, such as q', q'' , etc., will similarly be produced at the same time, the

Fig. 4.

Fig. 5

first of the series being q' , the image of Q in the mirror BA. By an eye placed between the mirrors, the succession of images will be seen as described; and if the mirrors were perfectly plane and parallel, and reflected all the light incident on them, the number of the images of both series would be infinite. If, instead of being parallel, the mirrors are inclined at an angle, the form and position of the image of an object may be found in precisely the same way as in the former case, the image formed with the first mirror being regarded as a new (virtual) object, whose image, with regard to the second, has to be determined. For a curious application of two plane mirrors meeting and inclined at an angle an aliquot part of 180° , see art. KALEIDOSCOPE.—3. The two propositions already established are of extensive application, as has partly been shown. They include the explanation of all phenomena of light related to plane mirrors. The third proposition is one also of considerable utility, though not fundamental. It is: When a ray of light has been reflected at each of two mirrors inclined at a given angle to each other, in a plane perpendicular to their intersection, the reflected ray will deviate from its original course by an angle double the angle of inclination of the mirrors. Let A and B (fig. 5) be sections of the mirrors in a plane perpendicular to their intersection, and let their directions be produced till they meet in C. Let SA, in the plane of A and B, be the ray incident on the first mirror at A, and let AB be the line in which it is thence reflected to B. After reflection at B, it will pass in the line BD, meeting SA, its original path, produced in D. The angle ADB evidently measures its deviation from its original course, and this angle is readily shown to be double of the angle at C, which is that of the inclination of the mirrors. It is on this proposition that the important mathematical instruments called the quadrant and sextant (q. v.) depend.

Curved Surfaces.—As when a pencil of light is reflected by a curved mirror, each ray follows the ordinary law of reflection, in every case in which we can draw the normals for the different points of the surface, we can determine the direction in which the various rays of the pencil are reflected, as in the case of plane mirrors. It so happens that normals can be easily drawn only in the case of the sphere, and of a few

"surfaces of revolution," as they are called. These are the paraboloid, the ellipsoid, and the hyperboloid of revolution. The paraboloid of revolution is of importance in optics, as it is used in some specula for telescopes. See arts. *SPECULUM* and *TELESCOPE*. The three surfaces last named are, however, all of them interesting, as being for pencils of light incident in certain ways what are called surfaces of accurate reflection—i.e., they reflect all the rays of the incident pencil to a single point or focus. We shall explain to what this property is owing in the case of the parabolic reflector, and state generally the facts regarding the other two.

1. The concave parabolic reflector is a surface of accurate reflection for pencils of rays parallel to the axis or central line of figure of the paraboloid. This results from the property of the surface, that the normal at any point of it passes through the axis, and bisects the angle between a line through that point, parallel to the axis, and a line joining the point to the focus of the generating parabola. Referring to fig. 6, suppose a ray incident on the surface at P, in the line SP, parallel to the axis AFG. Then if F be the focus of the generating parabola, join PF. PF is the direction of the reflected ray. For PG, the normal at P, by the property of the surface, bisects the angle FPS, and therefore \angle (angle) FPG = \angle GPS. But SPG is the angle of incidence, and SP, PG, and FP are in one plane, and, therefore, by the laws of reflection, FP is the reflected ray. In the same way, all rays whatever, parallel to the axis, must pass through F after reflection. If F were a luminous point, the rays from it, after reflection on the mirror, would all proceed in a cylindrical pencil parallel to the axis. This reflector, with a bright light in its focus, is accordingly of common use in light-houses.

2. In the concave ellipsoid mirror there are two points—viz., the foci of the generating ellipse, such that rays diverging from either will be accurately reflected to the other. This results from the property of the figure, that the normal at any point bisects the angle included between lines drawn to that point from the foci.

3. Owing to a property of the surface similar to that of the ellipsoid, a pencil of rays converging to the exterior focus of a hyperbolic reflector, will be accurately reflected to the focus of the generating hyperbola.

The converse of the above three propositions holds in the case of the mirrors being convex.

Though the sphere is not a surface of accurate reflection, except for rays diverging from the center, and which on reflection are returned thereto, the spherical reflector is of great practical importance, because it can be made with greater facility and at less expense than the parabolic reflector. See art. *TELESCOPE*. It is necessary, then, to investigate the phenomena of light reflected from it.

4. *Spherical Mirrors*.—It is usual to treat of two cases, the one the more frequent in practice, the other the more general and comprehensive in theory. First, then, to find the focus of reflected rays when a small pencil of parallel rays is incident directly on a concave spherical mirror. Let BAB' (fig. 7) be a section of the mirror, O its center of curvature, and A the center of its aperture. AO is the axis of the mirror, and therefore of the incident pencil, because it is incident directly on the mirror; a pencil being

Fig. 6.

Fig. 7.

Fig. 8.

called oblique when its axis is at an angle to the axis of the mirror. As the ray incident in the line OA will be reflected back in the same line—OA being the normal at A—the focus of reflected rays must be in OA. Let SP be one of the rays; it will be reflected so that \angle qPO = \angle SPO. But \angle POq = \angle OPS by parallel lines. Therefore, \angle qPO = \angle qOP, and Pq and Oq are equal. If, now, the incident pencil be very small—i.e., if P be very near A—then the line Pq will very nearly coincide with the line OA, and Pq and Oq will each of them become very nearly the half of OA. Let F be the middle point of OA—the point, namely, to which q tends as the pencil diminishes. The F is called the principal focus of the mirror, and AF the principal focal length, which is thus = $\frac{1}{2}$ radius of the mirror. It will be observed that when AP is not small, q lies between A and F. Fq is called the aberration of the ray. When AP is large, the reflected rays will continually intersect, and form a luminous curve with a cusp at F. This curve is called the caustic (q.v.). We shall now proceed to the more general case of a small pencil of diverging rays, incident directly on a concave spherical mirror. Let PAP' (fig. 8) be a section of the mirror, A the center of its aperture, O of its curvature, and let F be its principal focus. Then, if Q be the focus of incident rays (as if proceeding from

a candle there situated), q , the focus of the reflected rays, lies on QOA, since the pencil is incident directly, and the ray QOA, being incident in the line of the normal OA, is reflected back in the same line. Let PQ be any other ray of the pencil. It will be reflected in Pq, so that $\angle QPO = \angle OPQ$; and on the supposition that PA is very small, so that QP becomes nearly equal to QA, and qP to qA , it can be shown, by Euclid, vi. 3, that $\frac{QO}{QA} = \frac{qO}{qA}$ very nearly. From this equation is deduced the formula $qA = \frac{QA \times AF}{QA - AF}$, which enables us to find qA , when QA and AF are known. Thus, let the radius of curvature be 12 in., and the distance of the source of the rays, or QA, 30 in., the focal length $qA = \frac{30 \times 6}{30 - 6} = 7\frac{1}{2}$ inches. If the rays had diverged upon q , it is clear they

Fig. 9.

would have been reflected to Q. The points Q and q , accordingly, are called conjugate foci.

If the mirror be convex, as in fig. 9, instead of concave, and a pencil of diverging rays be incident directly on it from Q, we should find, proceeding in exactly the same way as in the former case, the equation $Aq = \frac{QA \times AF}{QA + AF}$; or taking the

same numbers as before; $qA = \frac{30 \times 6}{30 + 6} = 5$ inches.

For information regarding the formation of images by spherical mirrors, the reader may consult Potter's *Elements of Optics*. See also MIRRORS.

By considering fig. 8, it is easy to see now the relative positions of the two conjugate foci, as they are called, Q and q , vary as the distance, AQ, of the origin of the rays is changed. As Q is advanced towards O, q also approaches O, since the angles QPO and qPO always remain equal; and when the source of the light is in the center, O, of the sphere, the reflected rays are all returned upon the source. As Q, again, recedes from O, q moves towards F, which it does not quite reach until the distance of Q is infinite, so that the incident rays may be considered as parallel, as in fig. 7. If Q is placed between O and F, then q will be to the right of O; and when Q coincides with F, the reflected rays will have no focus, but will be parallel. If Q is between F and A, the reflected rays will diverge, and will have their virtual focus to the left of A. The correctness of these deductions may easily be verified. The positions of the conjugates are traced in precisely the same way for the convex mirror.

CATOPTROMANCY, divination by the mirror or looking-glass. At Patras, in Greece, the sick foretold their death or recovery by means of a mirror let down with a thread until its base touched the water in a fountain before the temple of Ceres. The face of the sick person appearing healthy in the mirror, betokened recovery; if it looked ghastly, then death was sure to ensue. More modern superstitions attach ill-luck to the breaking of a looking-glass, and to seeing one's face in a glass by candle-light.

CATO STREET CONSPIRACY. A plot formed in 1820 by Thistlewood, Ings, Tid, Brunt and others, with the design of murdering Lord Castlereagh and the other ministers, setting fire to London, seizing the Bank and Mansion House, and proclaiming a provisional government. The conspirators had already fixed the day for the execution of their plans, when they were attacked by the police while they were arming themselves in a stable in Cato street. Thistlewood, the ringleader, was executed with four others. Five more were transported for life.

CAT-RIG. See CAT-BOAT.

CATS, JACOB, a Dutch statesman and poet, was b. at Brouwershaven, in Zeeland, in 1577, and after studying law, finally settled at Middelburg. He rose to high offices in the state, and was twice sent as ambassador to England, first in 1627, and again in 1652, while Cromwell was at the head of affairs. He died 1660. As a poet, he enjoyed the highest popularity. His poems are characterized by simplicity, rich fancy, clearness, and purity of style, and excellent moral tendency. The most highly prized of his productions were the *Huvelijk, Trouwringh* (a series of romantic stories relating to remarkable marriages), and the *Spiegel van den Ouden in Nieuwen Tyd*. The best edition of his works appeared at Amsterdam, in 19 vols., 1790-1800.

CATS-CRADLE. See CRATCH CRADLE.

CAT'S-EYE, a beautiful mineral, a variety of quartz receiving its name from the resemblance which the reflection of light from it, especially when cut *en cabochon*, or in a convex form, is supposed to exhibit to the light which seems to emanate from the interior of the eye of a cat. It has a sort of pearly appearance, and is *chatoyant* or characterized by a fine play of light, which results from the parallel arrangement of the minute fibers of the stone itself, or from an intimate mixture of some foreign substance, such as amianthus. It has been supposed that cat's-eye is silicified wood. It is of various colors, and is obtained chiefly from Malabar and Ceylon. The Singhalese are especially proud of it, believing it, although erroneously, to be only found in their island.

CATSKILL, village and co. seat of Greene co., N. Y., on the w. bank of the Hudson, at the mouth of Catskill creek, 34 m. s. of Albany. Pop. '90, 4,920. It is on the West Shore railroad; is the starting-point of a railroad to the Catskill mountains, and is connected with the Hudson River railroad by a ferry to Catskill station. It has a court-house, opera house, free academy, national banks, churches, public school library, daily and weekly newspapers, large hotels, several bridges, and manufactures of woollens, paper, etc.

CATSKILL GROUP, in geology, the name of rocks of the Devonian system seen in the northern counties of Pennsylvania. They are chiefly red sandstone and shale, and contain fossil scales of the earliest fishes. The Catskill mountains were formerly supposed to belong in this group, whence the name, now known to be inappropriate.

CATSKILL MOUNTAINS, a part of the Appalachian system w. of the Hudson river, mostly in Greene co., N. Y. The group, about 12 m. long, nearly parallel with the river about, 8 m. distant, turns westward in spurs extending many miles. Besides the Ulster and Delaware railroad, beginning at Kingston and leading w. into the mountains, there is a good wagon road from Catskill village to the "Mountain House," 12 m. w., which is a favorite summering place. The house stands on a terrace 2,231 ft. above the river, and almost at the edge of a perpendicular cliff several hundred ft. high. There is another public house on Overlook Mountain, a few miles to the s., which is estimated to be 3,500 ft. above tide. The views from these houses and from the neighboring peaks are wonderfully varied and beautiful, reaching from the Green mountains in Vermont to the highlands at West Point, and taking in nearly 100 m. of the Hudson river and valley, with numerous cities and villages, and a vast expanse of highly cultivated farming country. An immense number of summer boarders are accommodated through all this region, not only in hotels, but also in countless farm-houses and village homes. One of the highest points is the top of Overlook, 3800 feet. The other prominent elevations are Hunter Mountain, High Peak, and Round Top. One of the sights of the region is "The Clove," or ravine, and the falls therein. The ravine is about 5 m. long. At its head two rivulets unite and flow rapidly to a point where the mountain divides and forms a deep hollow into which the brook rushes over a cascade of 180 ft.; and further down are other falls, one of 80 and another of 40 feet. The ice formation in winter around the highest fall is particularly grand and beautiful. There are other ravines and water-falls in the region, but none equally important. The mountains are for the most part covered with thick forests of oak, hickory, ash, maple, beech, pine, etc.

CAT'S-TAIL. See **TYPHA**.

CAT'S-TAIL GRASS. See **TIMOTHY GRASS**.

CATTACK. See **CUTTACK**.

CATTARAUGUS, a co. in w. New York, on the Pennsylvania border, watered by the Allegheny and other rivers, and intersected by branches of the New York and Erie railroad; 1356 sq. m.; pop. '90, 60,866. The surface is undulating and the soil fruitful. The chief products are wheat, corn, oats, potatoes, hay, cheese, butter, wool, hops, and maple sugar. Iron, manganese, marl, peat, and sulphur are found. Co. seat, Little Valley.

CATTARO, a t. of Austria, in the crown-land of Dalmatia, is situated at the head of the gulf of Cattaro, about 86 m. s.e. of Ragusa. It is strongly fortified, and surrounded on all sides by mountains. The castle, a massive and almost inaccessible building, stands on a precipitous rock immediately behind the town. C. has a cathedral several churches and hospitals, and a population of 4,000. C., which was at one time the capital of a small republic, was in 1807 annexed to the kingdom of Italy, but was handed over to Austria in 1814 by the treaty of Vienna.—**CATTARO, GULF OF**, or **BOCCA DI CATTARO**, an inlet of the Adriatic, near the s. extremity of the Dalmatian coast. It consists of three basins or lakes, connected by straits of about half a mile in breadth. The outer entrance is only a mile and a half wide, and the total length of the gulf is about 30 miles. Mountains protect it from all winds, and it has a depth of from 15 to 20 fathoms.

CATTAGAT, or **KATTEGAT** (*Sinus Codanus*), the bay or arm of the sea situated between the e. coast of Jütland and the w. coast of Sweden, to the n. of the Danish islands. It is connected with the Baltic sea by the Great and Little Belt (q.v.), and by the sound. The Skager Rack (q.v.) connects it with the North sea. The length of the C. is about 150 m., and its greatest breadth 85 miles. It is of unequal depth, and has dangerous sand-banks. The principal islands are Lasøe, Samsøe, and Anhalt. The Danish shores of the C. are low, but the Swedish shore is very steep and rocky.

CATTERMOLE, GEORGE, one of the most distinguished of English painters in water-colors, was born at Dickleburgh, Norfolk, in 1800. His pictures, which embrace a wide range of subjects, are remarkable for their striking originality of conception, vigorous execution, and fine color and tone. One of his best known and greatest pictures is "Luther at the Diet of Spire," containing 33 portraits of the principal characters, copied from the authentic originals by the old masters. He also designed the engravings for his brother's *History of the Civil Wars*, and illustrated many scenes in Scott's novels and in Shakespeare. His later works are chiefly oil-paintings. He d. July 24, 1868.

CATTI, or **CHATTI**, a German people, included by Cæsar under the name *Suevi* (q. v.), who inhabited a country pretty nearly corresponding to the present Hesse. The south-western part of their territory, around *Mattiacum*, was conquered by the Romans under Drusus. The C. took part in the general rising of the Germans under Hermann. Tacitus praises them as excellent foot-soldiers. During the reign of Marcus Aurelius, in the end of the 2d c., they made incursions into Roman Germany and Rætia. Caracalla failed in an expedition against them and the Alemanni in the 3d century. About the middle of that century, their name began to give place to that of the Franks (q. v.), and is last mentioned by Claudian in the latter part of the 4th century.

CATTLE. See Ox.

CATTLE, in American law. See **CHATTEL**.

CATTLE-PLAGUE, **RINDERPEST** (Ger.), or **STEPPE MURRAIN**, is a contagious eruptive fever, or exanthema, of the bovine species; sheep, goats, deer, and other allied species occasionally, however, catch it from cattle. It occurs indigenously on the plains of western Russia, whence it has at various times overspread most parts of the old world. The specific virus from diseased or infected animals is the only source of cattle-plague; no filth, overcrowding, or other health-depressing cause has hitherto produced it. As in small-pox, scarlatina, and other eruptive fevers, an incubative stage, varying between two and twenty days, intervenes between the introduction of the virus into the system, either by inoculation or contagion, and the development of the characteristic symptoms. These consist essentially of congestion of the mucous and cutaneous surfaces, with a sort of apthous eruption, and thickening, softening, and desquamation of the superficial investing membrane. The disease runs a tolerably fixed and definite course, which is not materially altered by any known remedial measures. It seldom attacks the same individual a second time.

History.—The cattle-plague has been recognized for upwards of a thousand years. It appears to have destroyed the herds of the warlike tribes who overran the Roman empire during the 4th and 5th centuries. About 810, it traveled with the armies of Charlemagne into France, and about the same period is also supposed to have visited England. Several times throughout the course of every century it spread from the plains of Russia over the western countries of Europe, and is stated to have again visited England about 1225. Although occasioning, every few years, great losses on the continent of Europe, the plague does not appear to have again shown itself in England until 1714, when it appeared at Islington about the middle of July, was very destructive for about three months, but was again got rid of towards Christmas. In 1744, it was in Holland, destroying there, in two years, 200,000 cattle; in Denmark, from 1745–49, it killed 280,000; in some provinces of Sweden it spared only 2 per cent of the horned cattle. It made terrible havoc throughout Italy, destroying 400,000 beasts in Piedmont alone. In April, 1745, the plague was again imported into England, probably by some white calves from Holland, where, as already stated, it had for some time prevailed. It continued its devastations for twelve years, but it is now impossible accurately to discover the losses it occasioned. In the third and fourth years of its ravages, 80,000 cattle were slaughtered, and double that number are supposed to have died. In 1747, 40,000 cattle died in Nottingham and Lancashire alone; whilst, so late as 1757, 30,000 perished in Cheshire in six months. In March, 1770, the disease was brought with some hay from Holland to Portsoy, in the Moray firth; several cattle died, and others, to the value of £799, 12s. 2d., being destroyed, the further spread of the pest was prevented. By the wars which wasted Europe towards the close of the last and first eighteen years of the present century, cattle-plague was spread widely over the continent, and occasioned, wherever it occurred, terrible losses. Since then, at short intervals, it has spread—always being traceable to its source on the Russian plains—over Poland, Hungary, Austria, Prussia, portions of Germany and Italy, and has extended to Egypt. It has also reached China and Japan.

The British outbreak of 1865–67, like its predecessors, undoubtedly came from Russia. The steamer *Tonning*, from Revel, brought 331 cattle and 330 sheep into Hull on 29th May, 1865. A portion of the cattle had come from the interior of Russia, where the plague then was, or recently had been; the cargo was rapidly landed, and very hurriedly inspected. Nearly half of the cattle were distributed in various lots to butchers in Leeds, Derby, and Manchester, but, curiously, these do not appear to have left any contagion in their trail. One hundred and seventy-five came to London, remained from the Monday evening until Thursday's market in lairs at York road, adjoining the cattle-market. It was stated, in a leader in the *Times* of 15th Aug., that rinderpest was seen in the metropolitan market as early as 12th June. Certain it is that more than one lot purchased on 19th June carried the disease to several dairies in and about London. The first cases were mistaken for cases of poisoning, the cows they had stood beside were sent into market, and thus the subtle disorder in a few weeks spread into many dairies both in town and country. Twenty-three Dutch cattle, having stood over for several markets, were sent back to Holland on 2d July, carried with them the contagion, were placed in a field near Schiedam, but soon sickened and died, thus spreading the disease in Holland. During the next six months, plague was repeatedly reimported thence into England. Until 11th Aug., 1865, no restrictions whatever were

put upon the removal of cattle; diseased and infected animals were freely taken to fairs and markets, were openly traveled by road and rail; whilst the metropolitan market continued every week to send forth infected cases, not only to the neighboring counties, but to Southampton, Birmingham, Hereford, Liverpool, Edinburgh, and even to Aberdeenshire. As early as 18th July, the pest was brought from London to Huntly by four calves; subsequent outbreaks occurred in the same way. The stamping-out system was, however, early and rigidly enforced in Aberdeenshire, and eight distinct outbreaks were promptly got rid of.

In Edinburgh, it appeared probably about 9th Aug., was brought from London by some low-priced foreign cows; in six weeks, about 800, or one half the dairy cows in Edinburgh, had died—200 having been buried in one trench. By the end of Jan., four fifths of the dairy cows had perished, but Edinburgh was reported clear. In Glasgow, the first case occurred on 19th Aug., in a cow sent from Edinburgh. By 30th Sept., 432 cases were reported, and it continued to spread. By the middle of Oct., it was in Mr. Harvey's valuable stock of 800, of which 25 died in one night, and to save further loss, 50 healthy animals were in one day disposed of to the butcher. From Falkirk Trysts, as from Barnet, Norwich Hill, and other large English fairs, the disease was transmitted into fresh localities. From the autumn trysts, it was carried into Perthshire, Forfarshire, and Fifehire. Diseased cattle passing along in railway trucks, appear to have spread the contagion over the fields adjoining the line at Thornton, Fifehire. Into West Lothian it was conveyed in early Sept. by lambs from the Edinburgh market.

The rapid spread of the insidious disorder may be gathered from the fact that, whilst, during the week ending 24th June, 1865, there was only one outbreak at Mrs. Nicholl's dairy at Islington, and 30 animals affected, by 30th Sept. there were 1702 farms, sheds, or other places in which the pest had appeared, and 13,263 animals had been attacked. Three months later, 8252 separate places had been visited, and 62,743 animals attacked. During six months, the aggregate of cattle attacked was 76,002. During the three months to 30th Mar., 13,443 farms and other premises had been infected, and 147,275 cattle attacked. In Dec., 1865, the fresh cases each week reached 9000; but in spite of remedial and preventive measures, of orders in council, and restrictions on the movement of stock, the number of weekly cases steadily increased to 15,706 in the third week of Feb. "The cattle diseases prevention act" passed 20th Feb., 1866, and the advantages flowing from the restrictions thus tardily imposed on the trade in cattle, and the slaughter of diseased and infected animals, were speedily apparent. In four weeks, the number of cases was reduced by one half. During the three months ending 30th June, 28,276 cases were reported; during the next three months to 30th Sept., the numbers fell to 2108; whilst, to 29th Dec., the three months' cases were but 149; to 30th Mar., 1867, 89 new cases were noted. Throughout April and May the number of cases continued steadily to decline; but during the week ending 25th May a fresh outbreak occurred in the Finsbury district of the metropolis, and 81 animals died, or were slaughtered to prevent the further spread of the pest. With the exception of an isolated outbreak in Essex, which was promptly stayed by slaughter of the ailing and suspected animals, the country was free of plague during August. The following are the records of its destructive career during 1865-67:

	Attacked.	Killed.	Died.	Recovered.
England.....	223,672	102,740	90,450	21,589
Wales.....	8,888	1,180	5,794	1,117
Scotland.....	46,863	6,263	28,088	10,707
Total... ..	278,923	110,183	124,332	33,413

To this sad total must be added 11,000 cases known to have been attacked and unaccounted for, and upwards of 60,000 healthy cattle slaughtered to prevent the spread of the disease. Plague was again imported into Hull in Aug., 1872; it was brought with cattle from Cronstadt; it spread into several districts of the East Riding, attacked 72 animals, 51 of which were killed, and 21 died. In 1877, an outbreak took place in Germany, but by energetic measures was speedily suppressed without extensive losses.

Causes.—The development of cattle-plague by filth, overcrowding, miasmata, hot weather, or other such causes, is untenable. Faulty hygiene, by lowering vitality, probably renders the animal more prone to the attack, and less able to bear up against it, but it cannot originate plague. Like hydrophobia, small-pox, or syphilis, it is developed only by the special virus, which appears to have its habitat on the Russian steppes. This virus occurs abundantly in the blood of every plague-stricken beast, in the discharges from its nostrils, mouth, or eyes, in the off-scourings from the bowels, probably even in the breath. It may be transferred to healthy beasts by inoculation. A little of the blood or nasal or other mucous discharges of a plague case, if introduced underneath the skin of a healthy cow, develops the disease within a few days. The transference of the virus or contagion from the sick to the sound animal, is not always so direct and evident. As with other catching diseases, the virus may be carried considerable distances in the air; its particles are minute, but they have powerful vitality; it may adhere to the food that has lain before infected beasts; to the litter from the stalls, or even after it has been heaped for weeks; to the clothes of attendants; to the floors, walls, or stalling of build-

ings; to imperfectly cleansed cattle-trucks. So subtle and potent is the plague poison, and so endowed with the power of self-multiplication and growth, that a very minute portion of it finding access to the blood of a healthy animal of the bovine race increases so rapidly, that to use the words of the commissioners' report, No. III. p. 4, "the whole mass of the blood, weighing many pounds, is infected; and every small particle of that blood contains enough poison to give the disease to another animal." It may gain access to the blood probably through the air-passages, perhaps also by absorption through the mucous surface of the bowels, or even through the skin.

Symptoms.—In from three to six days after an animal has been exposed to the virus of cattle-plague, or about 36 to 48 hours after being purposely inoculated, the temperature of the body is raised by several degrees. A delicate thermometer introduced into the vagina or rectum, instead of marking about 102° F., indicates 104° to 106°. As yet the appetite, secretion of milk, breathing, and pulse are scarcely if at all affected, and but for the elevation of temperature, accompanied sometimes by dullness, the animal might be supposed to be in the best of health. Two or three days later, or usually within six or eight days after the beast has taken in the subtle virus, the mucous membrane of the mouth is generally observed to be slightly reddened, and soon a granular yellowish-white eruption, consisting of thickened epithelium cells and granules, appears on the gums round the incisor teeth, and by and by on the lips and dental pad. Some hours later, the same eruption extends to the cheeks, tongue, and hard palate. Within 48 hours, or about the sixth day of attack, a crust of epithelium covers the gums, lips, and mouth, and when wiped away, or accidentally rubbed off, leaves the abraded membrane red and vascular, and exhibiting patches of erosion. The membrane lining the vagina indicates very similar appearances; it is reddened and vascular, dotted with grayish translucent elevations about the size of rape-seeds, covered with a whitish-yellow, usually sticky discharge, and occasionally marked with patches of excoriation. The skin, like the mucous surfaces, is congested; there is hence a perverted development of scarf skin, and of the oleaginous secretion of the irritated sebaceous glands. The skin is thus invested with a furfuraceous desquamation; whilst on its thinner portions about the lips, between the thighs, and on the udder, there are papular eruptions or elevations. About two, or even three days after the temperature has been increased, and usually one, or even two days after the appearance of the characteristic eruption on the gums, the constitutional symptoms present themselves. The animal is dull, hangs its head, arches its back, the eyes are leaden and watery, and from both eyes and nose there latterly comes a dirty slimy discharge. Appetite and rumination are irregular, and in dairy cows, the secretion of milk rapidly abates. The breathing, especially towards the sixth day, is oppressed, expiration is prolonged, and accompanied by a peculiar grunt. The pulse is small and thready, and quickened as death approaches. The bowels, usually at first confined, become, towards the sixth or seventh day, much relaxed; the discharges passed, often with pain and straining, are profuse and liquid, offensive, acrid, pale colored, and occasionally mixed with blood. The patient loses weight and strength, totters if it attempt to walk, and prefers to lie rather than to stand. Death usually occurs about the seventh day, and is preceded by muscular twitchings, a peculiar sickly, often offensive smell, a cold clammy state of body, moaning, grinding of the teeth, and rapidly increasing prostration.

Prognosis.—Cases usually terminate unfavorably when about the fifth or sixth day the animal temperature falls rapidly; the pulse becomes small, quick, and weak; the breathing more difficult, distressed, and moaning; the diarrhea increased; and the depression more notable. A more favorable termination may be anticipated when, after the fifth day, the heightened temperature, so notable even from the earliest stages, abates gradually; the breathing becomes easier; the pulse firmer; the visible mucous membranes appear healthier; and patches of extravasation or erosion speedily disappear.

Sheep do not take rinderpest spontaneously, and even when kept with diseased cattle, or inoculated with cattle-plague virus, they do not catch the disease so certainly as cattle do. When diseased, they exhibit, however, very similar symptoms, but professor Röhl, and other observers, record that upwards of 40 per cent recover. Goats, deer, antelopes, gazelles, yaks, and indeed all animals taking rinderpest, exhibit with tolerable uniformity the same characteristic symptoms.

Post-mortem Appearances.—The mucous membranes are generally deeper colored than natural, are congested, softened, marked in places with the same granular patches discoverable during life within the mouth and the vagina, and in bad cases exhibit œdema, hæmorrhage, and sloughing. The first three stomachs sometimes contain a good deal of food, but show less declension from health than the fourth stomach, of which the mucous membrane is dotted with spots of congestion and extravasation. The coats of the bowels are thinned and easily torn. The mucous coat, especially towards the middle of the small intestines, the opening into the cæcum, and posterior half of rectum, is much congested, bared of epithelium, and sometimes ecchymosed, but never ulcerated. Peyer's glands, so generally inflamed in the somewhat analogous typhoid fever of man, are perfectly healthy. The liver, spleen, and pancreas seldom present any special appearances. The respiratory mucous membrane, like the digestive, is vascular, and marked with submucous hæmorrhage; the lungs are generally emphysematous, the heart often marked with petechial spots. The urino-genital, like the other

mucous membranes, is congested in females, especially towards the lower part of the vagina and vulva; the kidneys are sometimes rather softened, the serous membranes and nervous centers are perfectly unchanged. Dr. Beale, by his microscopical observations, discovers in the capillaries a great increase of nuclear or germinal matter, and white blood-corpuscles, which he believes may account for the local congestion. The blood itself is dark in color; in the later stages it contains less water, probably owing to the draining diarrhoea, and about double its usual proportion of fibrine. The muscular tissues are softened, easily broken down, and contain an abnormal amount of soluble albumen. The urine is little altered in quantity, but from the first rise in the animal temperature, it contains an increase of urea varying from 5 to 15 per cent. The chief change in the milk is its rapid diminution in quantity, and the increase of its fatty matters. The bile is watery, offensive, and prone to decomposition.

Treatment.—Cattle-plague is proved to be an eruptive fever. When the specific poison, on which such disorders depend, has entered the body of a susceptible subject, no remedy has yet been discovered which can destroy it, or even materially shorten or mitigate its effects. Until such an antidote is found, there can be no hope of certain cure. The cattle-plague commissioners have collected information regarding the four following methods of treatment—namely, the antiphlogistic, the tonic and stimulant, the antiseptic, and the special. Diverse as are these systems, the percentages of recoveries, varying from 25.83 to 27.45, were so nearly alike, that it is fair to conclude that no one of the systems tried exercised any notable influence in checking the mortality. Partly, perhaps, from the varying virulence of the plague, partly from differences in the nursing and care bestowed on the animals, the proportion of recoveries has varied greatly in different localities. Up to the end of 1865, in Huntingdon they were only 4.668 per cent; in Norfolk they were 12.102; in Flint, 15.909; in Scotland, 19.889; whilst in Fifeshire they reached 24.552; and in Yorkshire, 29.731 per cent.

Like small-pox, measles, and other eruptive fevers in man, rinderpest runs a definite course which cannot safely be interfered with. Rational treatment is therefore limited to warding off untoward symptoms, to careful nursing, and husbanding the failing strength. It must, however, be remembered that throughout the progress of the disease there is constantly given off from the sick body minute particles, which are capable of developing the disorder in healthy cattle. Hence plague-subjects, by the orders in council, are very properly desired to be immediately destroyed. Except, therefore, for purely scientific purposes, and with careful precautions to prevent the spread of the poison, it is unwise to attempt remedial treatment. Where, however, a beast is to have a chance of recovery, so soon as the elevated temperature indicates the accession of the disease, solid indigestible food should be withheld, and the patient restricted to mash, gruel, boiled linseed, malt, and other food, which can be digested without the necessity for rumination. The paramount importance of such a dietary is clearly demonstrated in the returns of the Edinburgh cattle-plague committee to the government commissioners. The recoveries amongst 310 cattle “fed with dry food, and treated medicinally with drugs,” were 13.6. Amongst 303 cattle treated with mixed food and hay, 22.2 recovered. Where mashes were given during sickness, but dry food supplied during convalescence, the recoveries reached 51.5; whilst in 95 cottagers’ cows, whose chief ordinary dietary consisted of mashed food, and which were fed in the same manner throughout both sickness and convalescence, and were besides carefully nursed but not doctored, the recoveries reached 73.7. Where the bowels at the outset are costive, a dose of oil, or a very small quantity of some saline purgative, may be required. Cold water, gruel, mashes, or stale bread soaked either in water or beer, should be offered at short intervals throughout the attack. The animal, kept in an atmosphere of about 60°, should be comfortably clothed, and have its legs bandaged. The hot-air bath and wet-packing has been repeatedly tried, but although probably useful in the earlier stages, appear, when the disease is fully established, to harass and weaken the patient. Small and repeated doses of sulphite of soda have in some cases proved useful, and may be conjoined with carefully regulated moderate doses of such stimulants as ale, whisky and water, sweet spirit of niter, spirit of ammonia, or strong coffee. It is most important, however, that these and other such medicines should be drunk by the animal of its own accord in its gruel, water, or mashes, as the forcible horning over of drenches always disturbs the patient. The inhalation of chloroform, although temporarily relieving the distressed breathing, does not appear to exert any permanent benefit.

Prevention.—From what has been stated regarding the nature of cattle-plague, it must be evident that its prevention can only be effected by the destruction of the specific virus, or by removing beyond its influence all animals on which it might fasten. Sparks fall harmless where no inflammable materials lie within reach, and there are many such materials. Neither should sheep, fresh hides, hay, nor any other fodder and litter from countries where this ruinous plague exists, or has recently visited, be allowed to enter British ports. This very obvious precaution took strong hold of the public mind, and the practical result is, that importations of cattle-plague are guarded against by the provisions of the contagious diseases (animals) acts, 1869 and 1878. Neither cattle, sheep, nor pigs, fodder, litter, or hides, can be landed from countries where the plague exists, or from places in direct communication with such infected countries. All foreign stock is

inspected at the ports of debarkation, and inspectors have orders for the immediate slaughter and disinfection of cattle-plague subjects, and of any animals with which they have been in contact. But even with such precautions, foreign cattle frequently bring with them catching disorders, notably foot-and-mouth disease. Since they constitute, however, less than 5 per cent of the total cattle stock of the country, such risks should be removed by converting the foreign cattle traffic into a dead-meat trade.

Rinderpest being found to resemble smallpox in men and sheep, it was thought that its propagation and virulence might be abated by vaccination with cowpox lymph; but cattle, even when effectually vaccinated, which is often a difficult task, readily take rinderpest, often in its most mortal forms.

Several outbreaks of splenic, or "Texan" fever (rinderpest), have occurred in the U. S. during the last half of this century. An epidemic raged in Ohio in 1877, and the fever destroyed much valuable stock in New York in 1882. The herds were quarantined and the sale of meats from the infected districts was prohibited. In this disease the animals are covered with ticks whose bite is deadly, as it impregnates the blood which flows to the liver, destroying the membrane and damaging the functions of the kidneys and bladder. The symptoms of C. P. are: a decided diminution of milk, and the presence of blood in the urine. In 1883, the board of medical and scientific experts, appointed by the agricultural department to prepare a report on the epidemic diseases among cattle in the U. S., said that the propagation of splenic fever among cattle in the southern Atlantic and Gulf states occurs only in summer, or early autumn, and seldom after a heavy frost. The British market was closed in that year against importations of American cattle; and the Treasury cattle commission concluded its report thus: "Nothing short of the absolute and undeniable extinction of this disease in the U. S. will reopen the British market to our live cattle." This disease is frequently confounded with pleuro-pneumonia, which has, up to this time, confined its ravages to the states east of the Alleghenies. The seat of the plague, in pleuro-pneumonia, is the lung. The commission appointed, 1882, reported that the ultimate source of lung plague was unknown; that it had prevailed in Europe from time immemorial, that it was brought to this country, 1848, by an infected cow, landed in Brooklyn; that it is invariably epidemic, never sporadic; and that consequently, if once exterminated, it will not appear again, unless through fresh infection. Pleuro-pneumonia was very prevalent in N. J. and N. Y., 1879. Prof. Law, of Cornell univ., was commissioned by the governor of N. Y. to investigate the disease, and, in connection with Gen. Patrick, rendered valuable services in securing its extermination—the state appropriating \$10,000 for this purpose. Up to 1879, the British loss from C. P. was estimated at \$500,000,000; and Prof. Law claims that if the contagion in this country should ever become general, it would be more expensive than a civil war. Our yearly losses, from the lung plague alone, are estimated at from \$2,000,000 to \$3,000,000, and the prospective loss at \$50,000,000. Purulent discharge from the nose is always a sign of an aggravated attack of pleuro-pneumonia; and cattle showing this symptom should invariably be killed. Inoculation at the tail of healthy animals, as soon as the disease appears in a herd, has been practiced with success; but Prof. Law disapproves of the custom, as the virulent poison is apt to be diffused through the air in the process, lodging in the fodder, etc., while the inoculation gives immunity for two years only. Carbolic acid administered in a very diluted state, in drinking water, and sprinkled about, in a crude form, destroys infection, killing the virus, as well as acting as a disinfectant. It should be placed in water, in the proportion of one part of pure acid, with thrice its weight of sal soda, to 1000 parts of water. Some preventive legislation has been attempted on this important subject; but the prompt action of some states, as N. Y., in endeavoring to stamp out the disease, has been offset by the negligence of other commonwealths in not providing proper laws for the protection of cattle. During the epidemic of 1879, the absence of legislation in Va., Del., and Md., rendered the success of the efforts of the N. Y. authorities very dubious. A bill was before the U. S. senate, 1881, to prevent the introduction and dissemination of communicable diseases among domestic animals. It prohibited, under heavy penalties, the introduction of diseased meats from foreign countries, or their transfer from state to state; and it authorized absolute embargo against the importation of meats from infected states. A somewhat similar bill was passed by both houses of congress, 1883.

Authorities.—Reports of British commissioners, Nos. I., II., III., and IV.; *The Cattle Plague*, by Prof. Gamgee; *Die Rinderpest*, by Roloff.

CATTOLICA, a t. of Sicily, in the province of Girgenti, and 14 m. n.w. of the city of that name. It has extensive sulphur-works, and a pop. of 7,200.

CATTY (Malayan, *kati*; Japanese, *kin*), the unit of weight used throughout Chinese and Malayan Asia, and by the Chinese all over the world. American scales exported to Asia are graduated into catties. A catty is $1\frac{1}{2}$ pounds avoirdupois.

CATTYWAR. See **KATTYWAR**.

CATULUS, VALE'RIUS, a celebrated Roman lyrist, was b. at Verona, 87 B.C. His father was an intimate friend of Julius Cæsar, and the young poet must have frequently met the great warrior at the paternal residence, when the latter was on his way to Gaul. In early life, he went to Rome, where his career was that of an Epicurean, and the expense of this kind of living soon involved him in pecuniary difficulties. To release

himself from these, he followed the prætor Memmius to Bithynia, with the intention, like his superior, of wringing a fortune out of the provincials. This fashionable but felonious method of acquiring money did not succeed in C.'s case, mainly, however, through the more dexterous cupidity of Memmius. After his return, C. appears to have lived mostly in Rome, and in very straitened circumstances. When he died is unknown. His poems, 116 in number, chiefly consisting of lyrics and epigrams—first brought to light by Benvenuto Campesani of Verona in the beginning of the 14th c.—have always been justly admired for their exquisite grace and beauty of style; but are, in many places, grossly indecent. In higher styles of writing, C. was equally successful, especially in his odes, of which, unfortunately, only four have been preserved. His heroic or narrative poem on the marriage of Peleus and Thetis—consisting of more than 490 hexameter lines—and the wild enthusiastic poem entitled *Atys*, are especially worthy of notice. Most of the earlier editions of C. include the works of Tibullus and Propertius. The best modern editions are by Sillig (1833), Lachmann (1829), and Ellis (1867 and 1889). There are English translations by Lamb (1821), Martin (1861), Cranstoun (1867), etc. See Munro's *Criticisms* (1878).

CATULUS, **QUINTUS LUTATIUS**, d. 87 B.C.; consul of Rome with Caius Marius. Catulus was beaten by the invading Cimbri and driven across the Po, but Marius came to his aid, and the barbarians were defeated at Vercellæ in July, 101 B.C. In the civil war Catulus supported Sulla and was proscribed. Preferring death to capture, he suffocated himself over burning charcoal.

CATULUS, **QUINTUS LUTATIUS**, son of the consul; made consul in 78, and censor in 65, B.C. He put down a rebellion incited by Lepidus after the death of Sulla, and assisted Cicero in the suppression of Catiline's conspiracy.

CAUB, a t. of Nassau, n. Germany, on the right bank of the Rhine, 21 m. w.n.w. of Wiesbaden. It is noteworthy as the place where Blücher crossed the Rhine with his army, Jan. 1, 1814; and also as the place where, till 1866, toll was levied by the duke of Nassau—the only ruler who kept up this feudal privilege—from vessels navigating the Rhine. C. has underground slate-quarries; and opposite, on an island in the river, where Louis le Débonnaire died, 840, is a castle called the Pfalz, built in 1326, and which is said to have been resorted to for safety by the countesses Palatine during their confinement. C. is threatened with destruction by the disintegration of the mountains behind, and in Mar. 1876 a destructive landslip took place. Pop. about 8000.

CAUCA, a river of the United States of Colombia, in South America, which, after flowing 500 m. to the n.e., joins the Magdalena on the w., 150 m. from the Caribbean sea. It gives name to the department of Cauca.

CAUCA, one of the United States of Colombia, occupying the whole w. coast of the Caribbean sea to Ecuador, including the chain of the Andes and the valley of the Rio Cauca; 257,462 sq. m. (more than half of the republic); pop. '81, 621,000; later est., 641,000. The region is well cultivated, producing cereals, sugar, tobacco, coffee, cocoa, cotton, etc., and vast herds of horned cattle and mules. The capital is Popayan.

CAUCASIAN VARIETY OF MANKIND, an ethnological division adopted by Blumenbach, which included all the inhabitants, ancient and modern, of Europe (except the Finns); in Asia, the Hindus (of high class at least), Persians, Assyrians, Arabians, Jews, Phœnicians, inhabitants of Asia Minor and of the Caucasus, etc.; and in Africa, the Egyptians, Abyssinians, and Moors. What Blumenbach had called Caucasians, Dr. Prichard, who may be said to have laid the real foundation of ethnology, makes to consist of two independent groups or varieties, grounding on a radical difference of language. One of these is the Syro-Arabian or Shemitic (q.v.) race, and the other the Indo-European or Aryan (q.v.) race. The inhabitants of the Caucasus, so long held to be types of the European variety, are now by some excluded from it altogether, and classed with the shallow flat-faced Mongols, to which it is considered the nature of their language and other facts ally them more closely than the symmetry of their shape and complexion do to the European variety. The narrow basis upon which the theory of the Caucasian type was first formed is thus stated by Dr. Latham: "Blumenbach had a solitary Georgian skull; and that skull was the finest in his collection—that of a Greek being the next. Hence it was taken as the type of the skull of the more organized divisions of our species. More than this, it gave its name to the type, and introduced the term *Caucasian*. Never has a single head done more harm to science than was done in the way of posthumous mischief by the head of this well-shaped female from Georgia." See **ETHNOLOGY**.

CAUCASUS, a mountain range of great geographical and ethnographical importance, occupying the isthmus between the Black sea and the Caspian, its general direction being from w.n.w. to e.s.e.—from the peninsula of Taman on the Black sea, in lat. 45° 10' n., long. 36° 45' e., to the peninsula of Apsheron on the Caspian, in lat. 40° 20' n., long. 50° 20' e.—a length of about 750 miles. The breadth, including the secondary ranges and spurs, may be stated at about 150 m., but the breadth of the higher C. is much less, not much exceeding 60 or 70 miles. This range, formerly belonging entirely to Asia, now forms part of the boundary-line between Europe and Asia. The higher and central part of the range is formed of parallel chains, not separated by deep and wide valleys, but

remarkably connected by elevated plateaus, which are traversed by narrow fissures of extreme depth. The highest peaks are in the most central ridge or chain—Mt. Elburz attaining an elevation of 18,000 ft. above the sea, while Mt. Kasbeck reaches a height of more than 16,000 ft., and several others rise above the line of perpetual snow, here between 10,000 and 11,000 ft. high; but the whole amount of perpetual snow is not great, nor are the glaciers very large or numerous. This central chain is formed of trachyte. The secondary parallel chains are, on the inner side, mostly formed of argillaceous slate and plutonic rocks; on the outer side of limestone. The spurs and outlying mountains or hills are of less extent and importance than those of almost any other mountain-range of similar magnitude, subsiding as they do until they are only about 200 ft. high along the shores of the Black sea. Some parts are entirely destitute of wood, but other parts are very densely wooded, and the secondary ranges, near the Black sea, exhibit most magnificent forests of oak, beech, ash, maple, and walnut; grain is cultivated in some parts to a height of 8,000 ft., while, in the lower valleys, rice, tobacco, cotton, indigo, etc., are produced. As might be expected from the geographical situation of the C., the climate, though it is generally healthy, is very different on the northern and southern sides, the vine growing wild in great abundance on the s., which is not the case on the north. The s. declivity of the mountains, towards Georgia, presents much exceedingly beautiful and romantic scenery.

There are no active volcanoes in Mt. C., but every evidence of volcanic action. There are mud-volcanoes at each end of the range, and there are also famous naphtha springs in the peninsula of Apheron. See BAKU. Mineral springs also occur in many places. The bison, or aurochs, is found in the mountains; in the forests are many fur-bearing animals; and game abounds. Bears, wolves, and jackals are among the carnivorous animals. Lead, iron, sulphur, coal, and copper are found.

The waters of the C. flow into four principal rivers—the Kuban, and the Rion or Faz (the *Phasis* of the ancients), which flow into the Black sea; and the Kur and the Terek, which flow into the Caspian. The Russians have carried a military road, with great labor and danger, through a valley somewhat wider than most of the Caucasian valleys, between the sources of the Kuban and the Terek. This road passes over a height of about 8,000 ft., and is protected by many forts, but is exposed to other dangers besides those which arise from the hostility of the mountain tribes. The only other road is by the pass of Derbend, near the Caspian sea.

The resistance which the Caucasian tribes, for more than half a century, offered to the arms of Russia, attracted to them the attention of the world. But with the capture (1859) of the prophet-chief of the Lesghians—Schamyl, the most active and determined of the foes of Russia, who for a quarter of a century withstood and harassed the armies sent against him—the power of the Caucasians was greatly shattered; and after his death in 1871 the Russians regarded the territory as virtually subjugated. A large number of the Circassians elected to migrate to Turkish territory, where they were welcomed. The general name Circassians (q.v.) is often, but not very correctly, applied to the tribes which inhabit the Caucasus, and whose whole number is not above 1,300,000 or 1,500,000. From the situation of Mount C., there have gathered together in it tribes belonging to a greater number of distinct races than can perhaps be found within the same space anywhere upon the earth. There are more than 100 different languages or dialects spoken; the Turkish-Tartar language, however, serving for a general medium of communication. The different tribes inhabiting the C., long believed to be the purest type of the Indo-European family, are now considered not to belong to it at all, but to have more affinity with the Mongolian races. See CAUCASIAN VARIETY OF MANKIND. The principal tribes are the Tsherkesses or Circassians, Ossetes, Lesghians, Abchasians, Georgians, Suans, and Tchetches. The Georgians and Ossetes are at least nominally Christians; the Lesghians are fanatical Mohammedans. The Byzantine emperors and kings of Georgia planted Christian churches throughout this region, and many ruins of them remain, some of which are very beautiful. But the present Christianity of the nominally Christian tribes is more akin to heathenism than to true Christianity. In character, they are distinguished by their valor and love of freedom, but also by cruelty and treachery. They carry on a little agriculture, but live more by the care of their flocks, and by hunting.—The Russian lieutenantcy of the C. lying on both sides of the mountain range, has an area of 172,170 sq.m., and a pop. (1887) of 7,458,151. For type of people, see *illus.*, ETHNOLOGY, vol. V.

CAUCASUS, INDIAN. See HINDU-KUSH.

CAUCHON JOSEPH EDWARD, b. 1816; a Canadian journalist and legislator; was in the colonial or Dominion parliament, 1844–77. From 1867 to 1872 he was speaker of the senate. He established the *Quebec Journal*, 1842; was lieut.-gov., Manitoba, 1877–82; and d. in 1885.

CAUCHY, AUGUSTIN LOUIS, 1789–1857; a French mathematician; a member of the academy in 1816, and professor of mathematics in the polytechnic school. His reputation rests chiefly upon his residuary and imaginary calculus. In politics he was a firm legitimist, steadily refusing to take the oaths of allegiance from time to time proffered, and on that account resigning his chair of mathematics in the new university of Paris in 1852. He published several valuable works on the calculus, etc.

CAUCUS, a meeting, private or public, of citizens to select candidates for office; or of members of a legislative body for a similar purpose. Recently the meaning of the term has been extended to almost any conference previous to final action. Thus the people may hold a C. to ask or instruct their representative to support one or another measure; or the members of a party in congress, legislature, common council, or town-meeting may hold a C. to determine their course upon any subject. Legitimately, therefore, the term C. means a preliminary or preparatory meeting to arrange methods for some designated end. Much effort and ingenuity have been spent in trying to settle the origin of the term, but the most probable theory is that it came from Boston about the middle of the last century, and originally meant "the calkers' meeting," that is, the private gathering of the ship-calkers. The term was applied almost indiscriminately to meetings in the period preceding the revolution, and when the federal government was instituted it was accepted as the official term for what are now called "nominating conventions." Candidates for president of the United States were uniformly selected by a C. of the members of congress of the several parties, from 1789 to 1823. In the election of 1824, the regular democratic C. candidate, William H. Crawford, ran behind both Jackson and Adams, and but for some jugglery in New York would have run even behind Clay and come out the lowest of the four. This result ended the congressional C. system of presidential elections, and since that time candidates have been nominated by national conventions or political parties. Soon afterwards state conventions supplanted the legislative C. for the nomination of state officers, and now the C. is practically confined to the meetings of partisans in legislative bodies to decide upon a policy, or to select candidates for presiding and other officers of the particular body, or (by joint C. of senators and members of assembly) to settle upon nominees for U. S. senators. On the origin of the word see *Notes and Queries* (1885).

CAUDEBEC-LÈS-ELBEUF, a t. of France, in the department of Seine-Inférieure, 12 m. s. of Rouen. It has manufactures of cloth, and a pop. of (1876) 11,338.—**CAUDEBEC** is also the name of a t. in the same department, situated on the right bank of the Seine, 26 m. e. of Havre. It is one of the prettiest and most picturesque little towns on the Seine, with its old wooden houses and elm-shaded quays. It has a fine Gothic church of the 15th c., and manufactures of cotton, sail-cloth, leather, and soap. Formerly the capital of the Pays de Caux, C. was strongly fortified; and in 1419, so obstinate was its resistance, that it took the great English Gen., Talbot, 6 months to capture it. Pop. '91, 10,434.

CAUDE/TE, a t. of Murcia, Spain, 50 m. e.s.e. of Albacete. The inhabitants, 6,500 in number, are chiefly engaged in agricultural pursuits. C. is also the name of a small place in New Castile, a few miles from Teruel, where there are some of the largest bone-deposits, fossilized and unfossilized, in Europe.

CAUDINE FORKS (*Furcula Caudina*), two high, narrow, and wooded mountain gorges near the town of Caudium, in ancient Samnium, on the boundary towards Campania. These gorges are celebrated on account of the defeat here suffered by the Romans in the second Samnite war (321 B.C.). Four Roman legions commanded by the two consuls Titus Veturius and Spurius Postumius, after marching through a narrow pass, found themselves locked in a spacious valley, surrounded on all sides by lofty mountains, with no way out save that by which they entered, and another pass on the opposite side. Attempting to defile through the latter, they found it blocked up with trees and stones, and commanded by the Samnites, who had also in the mean time made themselves masters of the other pass. Consequently, the four legions were compelled to encamp in the valley. After some days, famine compelled them to surrender unconditionally. The Samnite gen., Caius Pontius, according to old custom, compelled the Romans to pass under the yoke, and then permitted them to march back. This submission was regarded as too ignominious for Rome, and consequently the two consuls and the other commanders were delivered again into the hands of the Samnites, who, however refused to have them.

CAUDLE LECTURES. Lectures like those delivered by Mrs. Caudle, the nagging wife in Douglas Jerrold's (q. v.) famous work, *Mrs. Caudle's Curtain Lectures*.

CAUGHNAWA'GA, a village in Laprairie co., Canada, 10 m. w. of Montreal, on the St. Lawrence, at the head of the Lachine rapids. It is inhabited exclusively by Indians, remnants of the once powerful Iroquois. Pop. '91, about 1700.

CAUL is a thin membrane encompassing the heads of some children when born, and is mentioned here on account of the extraordinary superstitions connected with it from very early ages down to the present day. It was the popular belief that children so born would turn out very fortunate, and that the C. brought fortune to those purchasing it. This superstition was so common in the primitive church, that St. Chrysostom felt it his duty to inveigh against it in many of his homilies. In later times, midwives sold the C. to advocates at enormous prices, "as an especial means of making them eloquent," and to seamen, as an infallible preservative against drowning. It was also supposed that the health of the person born with it could be told by the C., which, if firm and

crisp, betokened health, but if relaxed and flaccid, sickness or death. During last century, it was common to find advertisements in the newspapers of caul to be sold—from £10 to £30 being the prices asked for them. So recently as 8th May, 1848, there was an advertisement in the *London Times* of a C. to be sold, which "was with its late owner thirty years in all the perils of a seaman's life, and the owner died at last at the place of his birth." The price asked was six guineas. Sir John Offley, of Madeley manor, Staffordshire, by his will, proved at Doctors' Commons 1658, devised a C. set in jewels, which had covered him when he was born, to his daughter, thereafter to her son, and then to his own heirs-male. The C. was not to be concealed or sold out of the family. See Brand's *Popular Antiquities*, vol. iii.; *Notes and Queries*, 1st series, vol. vii.

CAULAINCOURT, ARMAND AUGUSTIN LOUIS DE, duke of Vicenza, a statesman of the French empire, was b. at Caulaincourt, a village in the department of Somme, Dec. 9, 1772. He entered the army at the age of fifteen, rapidly attained promotion, and, as col. of a regiment of carbineers, distinguished himself in the campaign of 1800. He was made a gen. of division in 1805, and shortly after created duke of Vicenza. In 1807, he was appointed ambassador at St. Petersburg, where he soon gained the confidence of the czar, who often made use of his advice. Disputes having arisen between Alexander and Napoleon, C. endeavored to restore amity and prevent war; but his proposals being rejected, he, in 1811, asked permission to resign his post, and received an appointment in the army of Spain. During the events of 1813, he was frequently employed as plenipotentiary in diplomatic affairs. In Nov. of 1813, he was made minister for foreign affairs, and in this capacity attended the congress at Chatillon, Jan., 1814. When Napoleon abdicated, C. endeavored to make use of his influence with Alexander to obtain the most favorable conditions for the fallen emperor, and, chiefly through his intervention, the island of Elba was ceded to Napoleon. During the hundred days, C. resumed office as minister of foreign affairs, and was made a peer. On the second restoration, he retired into private life. He died in Paris, Feb. 19, 1827. —His brother, AUGUST JEAN GABRIEL, count of Caulaincourt, b. 1777, served with distinction in all the campaigns from 1793 to 1812, when he fell in battle.

CAULIER, MADELEINE, a peasant girl of France who aspired to the military fame of the maid of Orleans. At the siege of Lille, in Sept., 1708, she conveyed into the city an important order to the officer in command, for which the duke of Burgundy offered her a large reward. This she declined, but received permission to raise a company of dragoons. She was killed in the battle of Denain, July 24, 1712, when Marshal Villiers defeated the imperialists.

CAULIFLOWER, a variety of the common kale or cabbage, affording one of the most esteemed delicacies of the table. It was cultivated as a culinary vegetable by the Greeks and Romans. Its culture was, however, little attended to in England till the end of the 17th c.; but after that time it rapidly increased, and prior to the French revolution, C. formed an article of export from England to Holland, whilst English C. seed is still preferred on the continent. The C. is entirely the product of cultivation. The leaves are not in this, as in other varieties of the same species generally, the part used, nor are they so delicate and fit for use as those of most of the others, but the flower-buds and their stalks, or, properly speaking, the inflorescence of the plant deformed by cultivation, and forming a head or compact mass generally of a white color. There are many subvarieties, but all of them are rather more tender than the ordinary forms of the species, and in Britain generally require more or less protection during winter, whilst the seed is sown on hotbeds, that the plants may be ready for planting out in spring. Later sowings are made in the open ground. The C. requires a moist rich loamy soil, with abundance of manure, and above all, very careful cultivation, which is directed to the object of having the heads not merely large, but as compact of possible. Great care is bestowed on the selection of proper plants for seed. In Scotland, C. plants almost always require the protection of the frame during winter. C. may be preserved for some time fit for use by pulling the plant up by the roots, and hanging it in a cold and dry place.—**BROCCOLI** (q.v.) may be regarded as another kind of cauliflower.

CAULKING is the operation of driving oakum or untwisted rope into the seams of a ship, to render them water-tight. The quantity thus driven in depends on the thickness of the planking; it varies from 1 to 13 double threads of oakum, with 1 or 2 single threads of spun-yarn. The caulker first *rains* or *reems* the seam—that is, drives a caulking iron into it, to widen the seam as much as possible, and close any rents or fissures in the wood; he then drives in a little spun-yarn or white oakum with a mallet and a kind of chisel, and afterwards a much larger quantity of black or coarse oakum. The fibers are driven in until they form a densely hard mass, which not only keeps out water, but strengthens the planking. The seam is finally coated with hot pitch or resin.

CAULONIA, an ancient Greek city in Italy near the gulf of Syllacium. It was a town of importance five centuries before Christ. In 389 B.C. it was captured by Dionysius the elder who removed its people to Syracuse. Porphyry asserts that Pythagoras sought refuge in Caulonia after his expulsion from Crotona.

CAULOP'TERIS, a generic name for the stems of fossil tree-ferns found in the carboniferous and triassic measures. They are hollow, and covered with the markings similar to the leaf-scars on recent tree-ferns. Twelve species have been described.

CAUS, or **CAULX**, SALOMON DE, 1576-1626; a French engineer and physicist who resided in England and in Heidelberg, and later in Paris. Little was known of him until Arago exhumed his works, from which he considered him to have been the real inventor of the steam engine, for in one of these works he gave the plan of an apparatus for raising water by the power of steam. Some critics believe that it was from Caus that the marquis of Worcester got the idea, printed in his *Century of Inventions* in 1633, of the "exact and true deposition of the most stupendous water-commanding engine, invented by the right honorable Edward Somerset, lord marquis of Worcester."

CAUSE. The words "Cause," "Causality," and "Causation," although familiar and intelligible in ordinary speech, have given rise to some of the most subtle questions in philosophy and theology. We shall here advert briefly to the chief meanings of these terms, and in so doing, we shall indicate the disputes that have arisen in connection with them.

In common language, we are accustomed to describe as the C. of an event, the one event immediately preceding it, and but for which it would not have happened. A man slips his foot on a ladder, falls, and is killed: we give the slipping of the foot as the C. of the fatality. A legislative assembly decides a question of great moment by the casting vote of the president, who is then not unfrequently spoken of as the C. of all the good or evil that followed on the decision. Now, a slight examination shows that this mode of speaking is defective, as not expressing the whole fact, or, in other words, presumes a great deal that is not stated. In the supposed death from a fall, there are many conditions necessary to the result besides the slipping of the foot: the weight of the body, the height of the position, the hardness of the ground, the fragility of the human frame, all enter into the C. strictly represented; but for practical purposes, we leave out of account all those elements that are not at the moment under our control, and allude to the one that is so. And when we speak of the decision of an assembly being the effect of the president's vote, we mean that his share in the responsibility is peculiarly great, or that, in order to turn the vote in one way, all that is necessary is to secure his individual opinion. If we do not enumerate all the conditions of the event, it is because some of them will, in most cases, be understood without being expressed, or because, for the purpose in view, they may without detriment be overlooked.

When, however, we aim at strict accuracy, as in the investigations of science, we must not be content with singling out the one turning event, but must enumerate everything that is necessary to the result. A *scientific C.* is the full assemblage of *conditions*, failing any one of which, the effect would not happen. In a full explanation of the phenomenon of the tides, we must enumerate all the circumstances connected with their production—the attraction of the sun and moon, the motions of the earth and the moon in their orbits, the globular form and rotation of the earth, the liquidity of the sea, the mode of distribution of the sea over the earth—every one of which facts is an essential in the full causation. The effect cannot be adequately accounted for without adverting to every one of those conditions, and it is therefore the sum-total of them that is rightly described as the C. of the tides. Taking this complete view of causation, it is found that every event that happens is the sequel to some previous event, in whose absence it would not have been, but which being present it is sure to occur. Between the phenomena existing at any instant, and the phenomena existing at the succeeding instant, there is an invariable order of succession; to certain facts, certain facts always do, and, as we believe, will continue to succeed. The invariable antecedent is termed the C.; the invariable consequent, the effect. What is termed the *law of universal causation*, consists in this, "that every consequent is connected in the manner now described with some particular antecedent, or set of antecedents."—Mill's *Logic*, book iii. chap. 5.

The physical philosopher—the chemist or physiologist—trusts to the uniformity with which the same C. yields the same effect; and if he can find out the true succession in one instance, he is satisfied that the same succession will always hold. In the physical sciences, therefore, there is no dispute as to the law of causation itself; the controversies on that head occur only in *metaphysics*. It is made a serious problem by mental philosophers, and also by theologians, to determine how we come by the irresistible belief that we are said to possess, that every event has and must have a cause. There are many answers to this question: *eight* are enumerated by sir William Hamilton (*Discussions on Philosophy*, p. 611, 2d edit.). It is only necessary, however, to advert to the two radically opposite points of view from which the subject is now surveyed.

The one view is, that we have an instinct or *intuition* of the mind by which we are compelled to recognize this law, so that to us it is a necessary truth, which we cannot escape from if we would. Our experience of the outer world, doubtless, shows us that things follow one another in an orderly and uniform manner, that the stone that sinks in water to-day does not float to-morrow, but no experience could give us the sense of commanding necessity that we have of the law of C. and effect. "Causation is not the mere invariable association of antecedent and consequent; we *feel* that it implies

something more than this." The philosophers who maintain this side give forth two different affirmations; the *one*, that we actually possess an intuitive belief of necessary causation; the *other*, that our possession of the belief is a sufficient proof that the law actually pervades the universe. Experience operates to confirm us in those instinctive tendencies, but no amount of experience would have been able to create them.

The latest modification of the theory that ascribes our belief in causation to an intuition of the mind, is the doctrine promulgated by sir W. Hamilton, to the effect that "we are unable to think that the quantity of existence, of which the universe is the conceived sum, can be either amplified or diminished. We are able to conceive, indeed, the creation of a world; this, in fact, as easily as the creation of an atom. But what is our thought of creation? It is not a thought of the mere springing of nothing into something. On the contrary, creation is conceived, and is by us conceivable, only as the evolution of existence from possibility into actuality, by the fiat of the Deity. And what is true of our concept of creation, holds of our concept of annihilation. We can think no real annihilation—no absolute sinking of something into nothing."—*Discussions*, p. 619. Thus, every effect must have a C., and every C. must have its effect, because, if it were not so, there would be either a pure creation or a pure annihilation, neither of which, according to sir W. Hamilton, is thinkable or conceivable by the human mind. This doctrine, however, has not found acceptance even by those who, if not actual disciples of the author, are most disposed to receive his philosophy generally, as may be seen by referring to Prof. Fraser's *Essays in Philosophy*, p. 170; M'Cosh *On the Divine Government*, p. 529, 4th edition; and Mansel, art. metaphysics, *Encyclopædia Britannica*. So far from the creation or annihilation of matter or force being inconceivable, it may be said with truth that until the end of last century it was not known as a fact that the materials of the globe are absolutely indestructible. The effects of combustion and evaporation could hardly suggest anything else than the annihilation of a certain portion of material. Combustion merely transformed the material consumed into other shapes, nothing being absolutely lost. So much for ponderable matter. As regards force, or moving power, the demonstration that this is never absolutely lost, even on the many occasions when it is so to all appearance, is a still later result of laborious scientific inquiries, being, in fact, one of the conclusions arrived at within the last few years. See FORCE. To represent, therefore, one of the latest achievements of experimental science as a primitive intuition of the human mind, is to violate, in the strongest manner, our sense of propriety and consistency.

As opposed to the intuitional doctrine of causation, we have a variety of views by Hume, Dr. Thomas Brown, and others, which need not be specified in detail. One may be given as an example. It has been seen that there are two affirmations in the theory just discussed; that the mind possesses an intuitive belief of causation, and that the possession of this belief is evidence of the existence of the law. Now, one or both of these affirmations may be denied; and the *denial* of either, by even a small minority of the human race, is held to be fatal to the theory, because *unanimity* is essential to the establishment of a universal instinct. Now, many men may possess an instinctive belief in the necessity of a cause to all effects, and of an effect to all causes; some, it is affirmed, do not; it cannot, therefore, be a universal or essential part of human nature.

In like manner, the second affirmation—namely, that the possession of an instinctive belief is a proof of the truth of the thing believed—is denied, on the ground that our instincts often dispose us to believe things that experience shows to be untrue. We have a strong natural tendency to believe in the universality and continuance of the exact order of things that we are ourselves born into, and are only put right by seeing the contrary. "A mere disposition to believe, even if supposed instinctive, is no guarantee for the truth of the thing believed. If, indeed, the belief ever amounted to an irresistible necessity, there would be then no *use* in appealing from it, because there would be no possibility of altering it. But even then the truth of the belief would not follow: it would only follow that mankind were under a permanent necessity of believing what might possibly not be true; just as they were under a temporary necessity—quite as irresistible while it lasted—of believing that the heavens moved, and the earth stood still. But, in fact, there is no such permanent necessity. Many of the propositions of which this is most confidently stated, great numbers of human beings have disbelieved. The things which it has been supposed that nobody could possibly help believing, are innumerable; but no two generations would make out the same catalogue of them."—*Mill's Logic*, book iii. chap. 21. Mr. Mill and others hold that the proof of the law of causation rests exclusively on the uniform and growing experience of the human race. This, however, is not inconsistent with our possessing the natural instinct above alluded to, by which we are led to suppose that what is will continue, and what has been will be repeated; an instinct that *coincides*, to a certain extent, with the law of C. and effect, and is therefore a predisposition on our part to accept what experience teaches on this head. It is only maintained that the instinct is of itself *no proof*, although useful in so far as it prepares us for what there is real evidence for believing. By yielding to the instinct in its crudest shape, the inhabitant of the tropics scouts the idea that water can ever be solid; the African would deny the existence of white men; and even an intelligent European could not be persuaded that any metal would float. Experience must correct the instinctive tend-

encies, otherwise no reliance can ever be placed upon them; by which we acknowledge it as the sole test of truth, while intuitive dispositions are no test whatever.

Even those who maintain the instinctive necessity of the conviction we are discussing, admit two great exceptions—viz., the existence of a FIRST C., itself uncaused, and the liberty of the will, or the exemption of human actions from the rule that applies so strictly to physical nature.

It is further contested between the two opposite schools of philosophy, whether or not MIND be the sole ultimate C. of all phenomena, as it is the C. most familiar to us—namely, the source of our voluntary exertions. On one side, it is affirmed to be “inconceivable that dead force could continue unsupported for a moment beyond its creation. We cannot even conceive of change or phenomena without the energy of a mind.” “The word action has no real significance, except when applied to the doings of an intelligent agent.” “Phenomena may have the semblance of being produced by physical causes, but they are in reality produced by the immediate agency of a mind; if they do not proceed from the human, they are the result of the divine will.” To this it is replied, that we are here taking for granted that every kind of power is analogous to that which we happen to be first acquainted with; but it is a pure assumption without proof or relevance, to suppose that all modes of energy must conform to this one type. Mill, book iii. chap. 5. It is further pointed out that even in ourselves, pure mind, or mind acting by itself, is not known to be an efficient C.; it must be mind together with body. The laborer cannot sustain a day’s toil merely because of his *wish* to do so; he must be fed, and rested, and have all his bodily organs in good condition, in order to do his work.

The subject of causation was very particularly studied by Aristotle. He enumerated four different kinds of causes, which have ever since had a place in philosophy. These are the *material*, the *formal*, the *efficient*, and the *final*. The first, or *material*, is what anything is made of; brass or marble is the material C. of a statue. The *formal* is the form, type, or pattern according to which anything is made; the drawings of the architect would be the formal C. of a house. The *efficient* is the power acting to produce the work, the manual energy and skill of the workmen, or the mechanical prime mover, whether that be human or any other. The *final* C. is the end or motive on whose account the work is produced, the subsistence, profit, or pleasure of the workman. Aristotle mentions the case of a physician curing himself, as exemplifying all the causes in one and the same subject. It is obvious that these are what we should now term the aggregate of *conditions* necessary to the production of any work of man; it being essential that there should be a motive for the work (final), a material to operate upon (material), a plan to proceed by (formal), and an exertion of energy to do what is wanted (efficient). When nature is viewed as the result of a creative mind, these causes are considered as inhering in the Divine contriver.

CAUSE CÉLÈBRE, a convenient French term for an especially interesting and important legal trial, criminal or civil, such as the Douglas case (1769–71), the Dred Scott case in the United States as to the possession of a negro (1856), the famous Tichborne case in England (1871–74), and that of the Parnell inquiry (1889). There is a French collection of *Causes Célèbres et Intéressantes* (22 vols. 1737–45), by Gayot de Pitaval, with later continuations.

CAUSERIE. (French, chat, gossip.) This term was first used in a literary way by Sainte-Beuve (q. v.) in his famous *Causeries du Lundi*, and signifies a short, familiar article on any subject, usually published in magazines or newspapers. As the writer is generally well known, its style is convenient where readers are interested in the author as well as in what he says. It is less formal than the generally accepted style of essay.

CAUSTIC (Gr. burning), in medicine and in chemistry, is the term applied to such substances as exert a corroding or disintegrating action on the skin and flesh. *Lunar C.* is nitrate of silver, and *common C.* is potash. When used as a C. in medicine, the substance is fused and cast into molds, which yield the C. in small sticks the thickness of an ordinary lead pencil, or rather less.—*C.* is also used in chemistry in an adjective sense—thus C. lime, or pure lime, CaO, as distinguished from mild lime, or the carbonate of lime, CaCO₃, C. magnesia, MgO, and mild magnesia, MgCO₃, etc.

CAUSTIC, **CATACAUSTIC**, and **DIACAUSTIC**. In optics, C. is the name given to the curved line formed by the ultimate intersections of a system of rays reflected or refracted from a reflecting or refracting surface, when the reflection or refraction is inaccurate. When the C. curve is formed by reflection, it is called the catacaustic—sometimes simply the C.; when formed by refraction, it is called the diacaustic curve. In mathematical language, a curve formed by the ultimate intersections of a system of lines drawn according to a given law is called the *envelope*, and is such that the lines are all tangents to it. As in a system of rays reflected or refracted by the same surface all follow the same law, it follows that the C. is the envelope of reflected or refracted rays.

An example of the catacaustic is given in the annexed figure for the case of rays falling directly on a concave spherical mirror, BAB', from a point so distant as to be practically parallel. The curve may be said to be made up of an infinite number of points, such as C, where two very near rays, such as P, Q, intersect after reflection. This catacaustic is an epicycloid. The curve varies, of course, with the nature of the

reflecting surface. In the case represented in the figure, the cusp point is at **F**, the principal focus. No such simple example can be given of the diacaustic curve as that above given of the catacaustic. It is only in the simplest cases that the curve takes a recognizable form. In the case of refraction at a plane surface, it is shown that the diacaustic curve is the evolute either of the hyperbola or ellipse, according as the refractive index of the medium is greater or less than unity.

The reader may see a catacaustic on the surface of tea in a tea-cup about half full, by holding the circular rim to the sun's light. The space within the caustic curve is all brighter than that without, as it clearly should be, as all the light reflected affects that space, while no point without the curve is affected by more than the light reflected from half of the surface.

CAUTERETS, a watering place in Hautes-Pyrénées, France, 26 m. from Tarbes. It is in a basin 3254 ft. above tide, and is noted for its many hot sulphur springs, ranging from 102° to 140° F. Pop. 1800.

CAUTERY. See BLEEDING, and MOXA.

CAUVERIPURAM, a t. of the district of Coimbatore, in the presidency of Madras, on the right bank of the Cauvery, in lat. 11° 54' n., and long. 77° 48' east. It takes its name from the neighboring gorge of 80 m. in length through the eastern Ghauts, along which the Cauvery finds a passage. Pop. of C. (or *Kaveripuram*), 7,000.

CAUVERY, or **KAVERI**, a river in the s. of Hindustan, rising in Curg, and flowing through Mysore and Madras, with a course of 472 m., into the bay of Bengal by various mouths. Its delta, with a coast of 80 m., and a depth of 70, lies almost wholly in the district of Tanjore. The C. is peculiarly available for irrigation. During the rainy season, the stream is navigable for small craft.

CAVA, a t. of Italy, in the province of Salerno, 3½ m. n.w. of the town of Salerno. It is a flourishing place, with manufactures of silk, cotton, linen, and pottery. About a mile from C. is the celebrated Benedictine monastery of the Trinity, with its magnificent archives, containing numerous MSS. and parchment rolls. Its library, at one time also rich in MSS. and rare printed books, has been dispersed. Pop. of commune, 21,000.

CAVAGNARI, Sir **LOUIS**, was born in France in 1841, educated at Christ's Hospital, London, and in 1857 became a British subject by naturalization. He had seen twenty-one years' military and political service in India when he was murdered on September 8, 1879, at Kabul. See **AFGHANISTAN**.

CAVAIGNAC, **ELÉONORE LOUIS GODEFROY**, 1801-45; a journalist of Paris, son of Jean Baptiste. He was an opponent of Louis Philippe and one of the prominent founders of the "Société des Amis du Peuple," and of the "Société des Droits de l'Homme." He was often arrested and sometimes imprisoned, but escaped in 1835 and went to Belgium. In 1841, he returned to Paris and became one of the editors of the *Réforme*, the ablest of the opposition newspapers.

CAVAIGNAC, **LOUIS EUGÈNE**, was b. in Paris, 1802, and was educated in the Polytechnic school, and the *École d'Application* at Metz. He first served in the Morea, and afterwards in Africa (whither he was sent in 1832 into a kind of honorable exile, in consequence of a too free expression of opinion in favor of republican institutions), where he acquired great distinction by his energy, coolness, and intrepidity. He was made chef de bataillon in 1837, and rose to the rank of brigade-gen. in 1844. In 1848, he was appointed governor-general of Algeria, but in view of the impending revolutionary dangers, was called to Paris, he having also been elected as a delegate to the national assembly by the two departments of Lot and Seine. In the insurrection of June which followed, C., as minister of war, had a most difficult task to play, and he displayed, during the four days and nights of the contest, remarkable presence of mind, firmness, and activity. His plan of action appeared strange and almost traitorous at the time. In opposition to the wishes of the national assembly, who desired that the troops should be dispersed over Paris, he divided his men into three separate bodies, which had to clear their several routes from obstacles in order to effect a reunion, streets and even quarters of the city being left for some time without military protection. Regarding the outbreak more as the beginning of a civil war than a mere insurrection, he, in fact, met the insurgents in true order of battle. His operations were successful, and his clemency was as remarkable as his generalship. When he had the power of assuming the dictatorship, he resigned it into the hands of the national assembly, which appointed him president of the council. As a candidate for the presidency of the republic, when Louis Napoleon was elected, he received about a million and a half of votes. On the *coup d'état* of Dec., 1851, C. was arrested, but released after a short detention; and though he consistently refused to give in his adhesion to the empire, he was permitted to reside in France without molestation. He died very suddenly of heart disease in Oct., 1857, at his country-house near Tours, and was buried in the cemetery of Montmartre, Paris, in presence of many thousand spectators, including several republican leaders. In debates, C. was remarkably unlike his countrymen, being not voluble and declamatory, but sober, clear, and moderate.

CAVAILLON, a t. and important railway junction in Vaucluse, France, 13 m. s.e. of Avignon. It is a poorly built and dirty place, but has a fine town-house, an old church of the 12th c., and the remains of a triumphal arch of about the time of Constantine; other relics of the Roman period are found in the neighborhood. There is considerable trade in dried fruits, madder, and the agricultural productions of the fertile region around. Pop., '91, 9077.

CAVALCANTI, GUIDO, abt. 1250-1300; an Italian poet and philosopher, son of the philosopher whom Dante pictured in torment among the Epicureans and Atheists—but himself a friend of the great poet. By marriage C. became the head of the Ghibellines, and after some years was banished with the other leaders, and died in exile. His poems are chiefly in honor of a French lady, by him called Mandetta. He also wrote on philosophy and oratory. See Bartoli's *Storia della Letteratura italiana*, vol. IV. (1881.)

CAVALIER, in fortification, is a defense-work constructed on the *terre-plein* or level ground of a bastion. It rises to a height varying from 8 to 12 ft. above the rampart, and has a parapet about 6 ft. high. Its uses are to command any rising ground.

CAVALIER (Fr. *chevalier*; Ital. *cavaliere*; Span. *caballero*, probably from the Latin *caballus*, a horse) originally meant any horse-soldier, but in English history is the name given to the party which adhered to King Charles I., in opposition to the round-heads (q. v.), or friends of the parliament.

CAVALIER, a county in northeastern North Dakota, formed in 1873 from part of Pembina and organized in 1884; 1512 sq. m.; pop. '90, 6471. Co. seat, Langdon.

CAVALIER, JEAN, about 1680-1740; a native of lower Languedoc, in southern France; the famous chief of the Camisards (who in some particulars seem to have been the precursors of the English and American shakers). He was a peasant's son, and was employed in sheep-keeping, afterwards as apprentice to a baker, and within that period trained by a pious Protestant mother. He was driven from his native place by the pitiless persecution of Protestants that followed upon the revocation of the edict of Nantes, and took refuge in Geneva. The murderous dragonnades of Louis XIV. drove the Protestants of the Cevennes at last to revolt, and C., inspired with the hope of being their deliverer, returned in 1702 to his own country, where he became one of the chosen leaders of the insurrection, which broke out in July of that year. It was Roland who was put in chief command, but C. soon rose to be his equal, and, though untrained in arms, he displayed not only fiery courage, but extraordinary military skill. Although these "children of God," as the insurgents were called, numbered at the most not more than 3,000 men-at-arms, they coped successfully again and again with the far greater forces of the king, and were never entirely conquered. After several conflicts, C. changed the seat of the war to the Vivarais; and Feb. 10, 1703, defeated the royal troops at Ardeche; but a few days later was himself defeated, but, recovering himself, was successful in subsequent encounters; invaded the region of the plains and even threatened Nismes. In April, 1704, he was defeated by Marshal Montrevel, but retreated with two-thirds of his forces. Marshal Villiers, being sent against him, proposed to negotiate instead of fighting, and although Roland refused to listen, C. agreed to treat, and received a captain's commission and a pension, while his father and other Protestant prisoners were liberated. As this treaty did not secure general liberty of conscience, C. was denounced as a traitor, and was so disheartened by his treatment everywhere, that he left France for Switzerland, and from thence passed to Holland, where he married. Having been authorized to recruit a regiment of Camisards to be sent to Spain, he proceeded to England, where he raised a regiment, and was sent by Queen Anne to Spain under the Earl of Peterborough and Sir Cloudsly Shovel, in May, 1705. At the battle of Almanza he was barely saved from death. After his return to England he was made a major-general and governor of Jersey, and finally governor of the Isle of Wight. He died at Chelsea. See CAMISARDS; also sketch in *Dictionary of National Biography* (1887).

CAVALIERI, EMILIO DE', composer, was born in Rome about 1550, and died in Florence about 1600. He was of excellent family, received a good education, and was called to the Medici court in Florence as general inspector of art. He had studied various instruments and the theory of music, and he wrote numerous madrigals and short musical plays. Although he imitated Caccini and Peri, of whom he was in reality the precursor rather than a follower, he took no active part in the Florentine music reform. His great work was a dramatic oratorio, *La rappresentazione dell' anima e del corpo*, which was performed in Rome in 1600.

CAVALIERÈ SERVENTE. See CICISBEO.

CAVALLI, FRANCESCO (Pietro-Francesco Caletti-Bruni), composer, born in Crema, near Venice, in 1600, and died at Venice in 1676. His father was *maestro di cappella* at the church of S. Maria, and the boy's talent attracted the attention of Federigo Cavalli, podestà of Crema, who became his patron and by whose name he was known. He studied under Monteverde and was his greatest pupil and follower. He was made organist in S. Marco in 1665, and in 1668 became *maestro di cappella*, holding this post until his death. Cavalli was for a short time in the service of the elector of Bavaria, and visited Paris twice in 1660 and 1662. A collection of Cavalli's church music was published in Venice in 1656, and some vespers for eight voices in 1675. But it is as a dramatic composer that Cavalli is celebrated. He treated the style developed by Caccini,

Peri, and Monteverde with greater freedom in rhythm, and though his harmony is crude he gave greater dramatic and declamatory expression to the whole. He prepared the opera for Alessandro Scarlatti, and was the greatest dramatic composer of his time. His operas include : *Le Nozze di Tetide e di Peleo*, Venice, 1639 ; *La Didone*, 1641 ; *Il Giasone*, 1649 ; *Alessandro*, 1651 ; *Il Serse*, 1654 ; and *L'Artemisia*, 1656. See Ambros's *Geschichte der Musik* (vol. IV.).

CAVALLINI, PIETRO, 1259-1344 ; a Roman artist taught by Giotto, whom it is believed he assisted in the mosaic of the ship of St. Peter, in the porch of St. Peter's church. He was also an adept at painting, and his grand fresco of the crucifixion at Assisi is still in tolerable preservation.

CAVALRY is a general name for horse soldiers or troopers, and in the United States army it is divided into regiments, each of which is commanded by a colonel. There are ten regiments, eight being composed of white troopers and two of colored. The First Regiment was organized by act of Congress March 2, 1833, as the first regiment of dragoons, and the designation was changed to cavalry by act of August 3, 1861. The Second Regiment was organized by act of Congress, May 23, 1836, as the Second Regiment of Dragoons, converted into a regiment of riflemen by act of August 23, 1842, reconverted to dragoons in April, 1844, and the designation changed to cavalry in August, 1861. The Third Regiment was organized by act of Congress, May 19, 1846, as the regiment of mounted riflemen, and its designation changed to cavalry August 3, 1861. The Fourth and Fifth were organized March 3, 1855 as the First and Second Regiments of Cavalry, and the designation changed to Fourth and Fifth Regiments in August, 1861. The Sixth Regiment was organized by direction of President Lincoln, May, 1861, and confirmed by act of Congress in July, 1861. The Seventh, Eighth, Ninth, and Tenth were organized by act of Congress July, 1866. Besides the colonel there are allowed to each regiment 1 lieutenant-colonel, 3 majors, 12 captains, 12 first-lieutenants, and 12 second-lieutenants, besides two additional lieutenants, one for adjutant and the other for regimental quartermaster, 1 chaplain, 1 sgt.-major, 1 qmr.-sgt., 1 chief musician, 1 saddler sgt., 1 chief trumpeter, 10 first sgts., 50 sgts., 40 corporals, 20 trumpeters, 20 farriers and blacksmiths, 10 saddlers, 10 wagoners, 352 privates. This gives 605 enlisted men to a regiment, or 6050 for the ten regiments of cavalry. The number of companies to which enlisted men are assigned has recently been reduced from twelve to ten by transferring the officers and men on duty with companies "L" and "M" to the other companies of the regiment, and leaving those two companies simply as "skeletons," assigning to them officers of the regiment who are away on detached service, or who have been condemned by medical boards as being unfit for further active service. Like the other arms of the service, the cavalry regiments are distributed among a great number of posts, and seldom are all the companies of a regiment on duty at the same place. On occasions of ceremony the cavalry follows the field artillery. The color of the facings and trimmings of the cavalry is yellow.

Egypt probably affords the earliest historical record of any distinct attempt at military organization, and from the earliest dates at which there is any record of armed men being systematically trained, cavalry has always formed an integral part. In early times chariots, although perfectly distinct from the cavalry, seem to have been intimately associated with it. Xenophon gives the first really authentic account of cavalry in his statement regarding the formation of cavalry into divisions by Lycurgus. In B.C. 371, Epaminondas raised a corps of 5000 cavalry; and from this time, armed horsemen were very much cultivated by generals commanding the armies, and many of their successes are due to the prowess of the cavalry. The Greeks had both heavy and light cavalry, and to these Alexander the Great added a third class, trained to fight both mounted and on foot. Cavalry fell into comparative disuse for a while, but in the latter days of the Roman republic it came again into favor, and was organized by the Romans into regiments of between seven and eight hundred men. The Gauls for many years furnished the principal part of the cavalry in use in Europe, and the reputation attained by these horsemen was of the highest order. Saddles were first used in the time of Constantine, and stirrups were introduced by the Franks about the middle of the fifth century. The invention of gunpowder and the decline of the feudal system made a change in military tactics, and cavalry as it now exists dates from about 1445. In the time of Francis I. of France his gens-d'armes were reckoned the best cavalry in Europe. They had, however, some years later to yield the palm to the Spaniards ; they in turn gave way to the Germans, who brought in a new system of tactics and formed their men in six or eight ranks, instead of in one rank, which was the former prevailing custom. Maurice of Nassau was the first to train cavalry with a view to their mobility, and teach them to act as separate bodies and in distinct lines. During the Thirty Years' War the lance as a cavalry weapon gradually disappeared. Gustavus Adolphus was the next most prominent advocate of the cavalry arm, and his formation of three lines was quite generally adopted by the rest of Europe. The wars of Louis XIII. and Louis XIV. were great developers of the military art, and their cavalry was renowned. About this time armor and the lance were very generally abandoned. The Turkish horsemen were also greatly dreaded by their opponents, and the Russian infantry feared them to such an extent that they carried chevaux-de-frise in carts to protect themselves. Marshal Saxe was among the

first to recognize the great use of light cavalry for the purpose of reconnoitring and for celerity in movement on all occasions, and he showed a masterly understanding of the power gained by a combination of artillery and cavalry. Frederick the Great discontinued arming cavalry with fire-arms and did away entirely with firing in line. He gave wonderful examples of what careful training and thorough preparation can do when combined with rapidity of execution in the field. The genius of Napoleon grasped the great good that could be derived from a careful organization of the cavalry that would enable him to follow up and reap the fruit of his victories. The manner in which he employed his mounted scouts, and the reconnoitres that his cavalry constantly made, were very considerable factors in his success in outmanœuvring his enemies and anticipating their designs. The fact of his cavalry having been utterly demoralized in the Russian campaign, and of their not again being completely reorganized, prevented his following up his subsequent victories as brilliantly as he had formerly been able to do. The French cuirassiers were now armored to a greater degree than had been the custom for many years, and the lance was once more introduced, and has ever since been the arm of a portion of the cavalry force of Europe. The long peace that followed these campaigns, and the few opportunities when war did break out for the use of cavalry, conduced greatly toward its deterioration. In India many deeds of valor were accomplished by both English and native horsemen, but the European battlefields were, as a rule, unsuited for cavalry tactics. When Austria and Prussia fought in 1866 there was a large force of cavalry, but beyond reconnoitring little was really accomplished. A few lessons were learned, however, which bore excellent fruit later when France and Prussia came together. The cavalry of the latter was most carefully organized and drilled, and proved most efficient in gaining intelligence of the movements of the French. The information obtained, and the manner in which the German troops were masked, enabled their strategic movements to be brought to a successful issue. The French cavalry, on the other hand, were not as thoroughly equipped for service, owing greatly to the neglect that had attended military matters previous to the breaking out of the war, and the blow that the cavalry received at this time has lasted, as the prestige it once enjoyed has never since been attained. Great progress was made in the cavalry of the United States during the civil war. Although at first composed largely of inexperienced troops, the cavalry, before the war closed, was admirably organized and attained a well-deserved reputation for efficiency in both armies. Carbines, capable of firing a number of rounds without reloading, and sabres formed the arms. In the expeditions against the Indians in the West the cavalry added greatly to its laurels. Cavalry, as a rule, is placed in the rear of the infantry, on ground favorable to its manœuvres, and where it will be masked from fire until the moment arrives for bringing it into action. Here, if acting on the defensive, the cavalry watches its opportunity to support the other troops, driving back the enemy by prompt and vigorous charges, or if on the offensive, biding its time to rush upon the assailant when his ranks commence to waver or show signs of disorganization from the assaults of the other arms. The habitual formation for attack is in two lines, with a reserve or support in the rear. So long as infantry maintains its position firmly, particularly if the ground be at all unfavorable to the movements of cavalry, the chances are held to be against the successful attack of the latter.

CAVAN, an inland co. in the s. of Ulster, Ireland. It lies in the narrowest part of Ireland, 18 m. from the Atlantic, and 20 from the Irish sea. Area, 746 sq.m. About three fourths is arable. Bogs and hills, with many small lakes, are found in the n.w. The chief rivers are the Erne, the Woodford, and the Annalee. The e. half of C. rests on clay-slate and graywacke; the mountain-district in the w. is carboniferous formation. Of minerals, C. affords coal, iron, lead, and copper, with many mineral springs. The climate is cold and damp; and the soil is poor, wet, and clayey, except along the streams, but considerable quantities of grain are produced. The population, which had fallen to 153,906 in 1861, was in 1881 only 129,476, of whom 104,328 were Roman Catholics, 18,990 Episcopalians, and the rest of other denominations. In 1891, the population was 111,917. Agriculture forms the chief industry, but linen is manufactured to a considerable extent. Chief towns—Cavan, Bailieborough, and Belturbet. C. returns two members to parliament.

CAVAN, the capital of Cavan co., Ireland, is situated on a branch of the Annalee, 70 m. n.w. of Dublin, with which it is connected by the Irish N. W. railway. The suburbs are chiefly wretched cabins. The principal buildings are in the w. outskirts. The public garden was bequeathed by a late lady Farnham, and the beautiful demesne of lord Farnham lies between C. and Lough Oughter, which is about 5 m. west. Pop. about 3000. Agriculture forms the chief industry of the people.

CAVARZE' RE, a t. of Northern Italy, province of Venice, 22 m. s.s.w. of Venice city. It is situated on the Adige, which divides it into two parts, called C. *destro* and C. *sinistro*. Its soil is fertile, and its inhabitants carry on an active trade in cattle, silk, and wood for fuel.

CAVATINA, a short form of operatic air, of a soft character, differing from the ordinary aria in consisting only of one part, and that spun out more in the form of a song. Modern composers have, however, disregarded this difference. Rossini mixes both.

Weber, in his operas, adds an introduction or a recitative. The most perfect specimen of the C. is that in Meyerbeer's opera of *Robert the Devil*.

CAVE, EDWARD, deserves mention as the founder of the *Gentleman's Magazine*, the first literary journal of the kind ever established. He was b. at Newton, in Warwickshire, in 1691; obtained a good education at Rugby; and, after many vicissitudes, became apprentice to a printer. Obtaining money enough to set up a small printing-office, he projected the *Gentleman's Magazine*, which has now existed more than a century and a quarter. He was the friend and early patron of Samuel Johnson. D. Jan., 1754.

CAVE, WILLIAM, an English divine and scholar of distinction, was b. at Pickwell, Leicestershire, Dec., 1637. He studied at Cambridge; was appointed to the vicarage of Islington in 1662; afterwards to the rectory of Allhallows the Great, London; and in 1690 to the vicarage of Isleworth, Middlesex. He d. at Windsor, Aug. 4, 1713. He was the author of many works of a religious character, the most important of which are the *Lives of the Apostles*; *Lives of the Fathers*; and *Primitive Christianity*, which were once standard works.

CAVEAT (Lat. *caveo*, to beware), a judicial warning or caution. Caveats, in England, are used to stop the enrollment of decrees in chancery, the issuing of lunacy commissions, etc. It consists in an intimation by the party interested to the proper officer, to prevent him from taking any step without such intimation being made to the said party as shall enable him to appear and object.

CAVEAT EMPTOR, notice to a purchaser of property to beware or be watchful of his rights. In a sale of real estate the rights of the purchaser depend entirely upon the covenants of title which he receives; but personal property the purchaser takes at his own risk, unless the seller gives an express warranty, or the law should imply such warranty from the circumstance of the case and the nature of the thing sold, or unless the seller should be guilty of fraudulent misrepresentation or concealment in respect to a material inducement to the sale.

CAVEAU, a convivial and literary association in Paris, so called from meeting in a cavern known as "the cave." It was started in 1729, and continued about ten years. Dinners were given on the first Sunday in each month, which were attended by Helvetius, Crebillon, and other celebrities. The Caveau Moderne was started in 1806, and had dinner on the 20th of each month at the Rocher de Cancale. The association declined, but was reorganized in 1834, and in 1866 Jules Janin was received as a member. The meetings are now more formal and academical than convivial.

CAVEDONE, JACOPO, 1577-1660; an Italian painter, educated in the school of Caracci, and workman under them in the churches of Bologna. His chief productions are "The Adoration of the Magi;" "The Four Doctors;" "The Last Supper;" and especially "The Virgin and Child in Glory," now in the Bolognese academy. He was at one time an assistant to Guido, in Rome. In his declining years he was broken down by the loss of a favorite son, and finally died in extreme poverty in a stable at Bologna.

CAVELIER, PIERRE JULES, 1814-94; a French sculptor, who studied under David d'Angers and Delaroche. He first gained celebrity about 1849 by a statue of "Penelope," for which he received the medal of honor and three years' pension. A few years later he became a member of the institute. Among his other works are "Truth," in the Louvre, a statue of Abelard, and busts of Napoleon, Ary Scheffer, and Horace Vernet.

CAVENDISH COLLEGE, founded, 1873, by the County College Association of Cambridge univ., in order to enable young undergraduates to pass through a university course at the least possible cost of money and time; and to make a specialty of the art of teaching. The present buildings of the college were begun, 1876. There are accommodations for 300 undergraduates. There were, 1890, about 33 students in residence.

CAVENDISH, FREDERICK CHARLES, Lord, 1836-82; second son of the duke of Devonshire; was educated at Trinity col., Cambridge; and became private sec. to Lord Granville, 1859. He represented the West Riding of Yorkshire in Parliament, from 1865 to the day of his death. Under Gladstone he was appointed financial sec. to the treasury, having already become a lord of that department. C. was appointed chief sec. of Ireland, 1882, succeeding Forster, but was assassinated almost immediately upon his entrance into office. C. was greatly esteemed, and his record gave warrant to the belief that his policy in this difficult post would be both creditable to England and helpful to the suffering in Ireland. The assassination was denounced by the Irish press and home-rulers.

CAVENDISH, HENRY, a distinguished philosopher of the 18th c., son of lord Charles Cavendish, and nephew of the third duke of Devonshire, was born at Nice, Oct. 10, 1731. He studied at Cambridge, and devoted his whole life to scientific investigations. The large fortune which was bequeathed to him by an uncle, enabled him to follow uninterruptedly his favorite pursuits. He almost secluded himself from the world, and was so averse to meet with strangers, that he had his library—a magnificent one—built at a distance from his house, so that he might not encounter persons coming to consult it; and his female domestic servants had orders to keep out of his sight, on pain of dismissal. His dinner he ordered daily by a note placed on the hall-table. He died, unmar-

ried, Feb., 1810, leaving considerable more than a million sterling to his relatives. As a philosopher, C. is entitled to the highest rank. To him it may almost be said we owe the foundation of pneumatic chemistry, for prior to his time it had hardly an existence. In 1760, he discovered the extreme levity of inflammable air, now known as hydrogea gas—a discovery which led to balloon experiments, and projects for aerial navigation; and later, he ascertained that water resulted from the union of two gases—a discovery, however, to which Watt (q.v.) is supposed to have an equal claim. The accuracy and completeness of C.'s processes are remarkable. So high an authority as sir Humphry Davy declared, that they "were all of a finished nature, and though many of them were performed in the very infancy of chemical science, yet their accuracy and their beauty have remained unimpaired amidst the progress of discovery." C. also wrote papers on electricity, astronomical instruments, etc.

CAVENDISH, THOMAS, abt. 1555-92; third circumnavigator of the globe. He studied for a brief period at Cambridge, but left without a degree, followed the court, and soon squandered his inheritance, to repair which he turned to maritime adventure, and fitted out a ship that accompanied sir Richard Grenville's expedition to Virginia in 1585. In July, 1586, he sailed from Plymouth with three vessels on a predatory expedition, passed through the straits of Magellan, cruised along the west coast of South America and Mexico, and burned or sunk 19 vessels, among which was the *Santa Anna*, belonging to the king of Spain, and having an immensely valuable cargo, which he seized off California. He returned to Plymouth Sept. 9, 1588, with his plunder, having gone around the globe in 2 years and 50 days. When he came home it was said that his seamen were clothed in silk, his sails were of damask, and his topmast was covered with cloth of gold. Within three years he wasted his wealth, and died on another voyage.

CAVENDISH, Sir WILLIAM, 1505-57; brought up in the family of cardinal Wolsey, whom he served as gentleman-usher of the chamber. He was present at the death of the cardinal, and delayed his attendance at court to see the remains of his patron properly cared for. The act so pleased Henry VIII. that he made Cavendish a member of his household, treasurer of his chamber, and a privy councilor, subsequently adding the dignity of knighthood. He filled other offices, and obtained grants of valuable lordships in Hertfordshire. His great property became the foundation of the immense estates of the dukes of Devonshire. He seems to have retained favor through the reigns of Edward VI. and Mary. He was the author of *The Life and Death of Cardinal Wolsey*.

CAVENDISH, WILLIAM, duke of Newcastle, a distinguished loyalist of the 17th c., son of sir Charles Cavendish, younger brother of the first earl of Devonshire, was b. 1592. His learning and winning address made him a favorite at the court of James I., who, in 1610, made him a knight of the Bath. Other honors rapidly succeeded. In 1620, he was made a peer of the realm. Charles I., about 1628, gave him the title of earl of Newcastle-upon-Tyne, and in 1638 intrusted him with the tuition of his son, afterwards Charles II. His support of the king during the contest with the parliamentary forces was munificent. He contributed £10,000 to the treasury, and raised a troop of 200 knights and gentlemen, who served at their own cost. As general of all the forces raised n. of the Trent, he had power to issue declarations, confer knighthood, coin money, and raise men; and the last part of his commission he executed with great zeal. The banquets C. gave to the king when he went n. were magnificent enough to find record in history; one of them cost no less than £15,000, even in those days when money was more valuable than it now is. After the battle of Marston Moor, C. retired to the continent, where he resided, at times in great poverty, until the Restoration. On his return, he was created duke of Newcastle. He died Dec. 25, 1676.

CAVENDISH'S EXPERIMENT. See EARTH.

CAVE-DWELLERS. The primitive inhabitants of most civilized countries were troglodytes, or cave-dwellers. The cave-dwellers of the so-called palæolithic period were to all appearance contemporaneous with the mammoth, the woolly-haired rhinoceros, and the great cave carnivora. In England, France, Belgium and other countries of Europe, numerous caves have been explored which were doubtless the habitations and workshops of the men of this early period. These caverns vary in character and dimensions, but all agree in being recesses capable of affording comparatively dry and commodious shelter. Hence they were resorted to as places of habitation by wild beasts and by men. It is evident in the case of some of these caverns that they were first inhabited by the extinct carnivora of that period, as, for example, in the famous Kent's Hole cave of Devonshire, England. See KENT'S CAVERN. In this cave bones and teeth of the fossil elephant, rhinoceros, horse, cave-bear, hyena, reindeer and Irish elk have been found, and along with these, numerous weapons and implements of chipped flint horn, and bone, the unmistakable proofs of man's presence. At Brixham (q.v.) a bone cave (q.v.) was discovered in 1858, containing bones of the mammoth, rhinoceros, horse, hyena, and reindeer, besides palæolithic flint implements. In the caves at Perigord (q.v.), in central France, various drawings of animals, including the reindeer, have been found cut on bone and stone, apparently with a pointed instrument of flint. The most remarkable of all these is the portrait of a mammoth, seemingly executed from the life. This portrait was outlined on a plate of ivory found in the Madeleine cave, on the river Vézère, by M. Larlet when in the company of M. Verneuil and Dr. Falconer. The drawings

found in these caves include animals, singly and in groups, such as the mammoth, reindeer, horse, and ox; also fish, flowers, and, finally, rude attempts at the human form. These caves, which were explored by M. Lartet and Mr. Christy in 1863-64, penetrate the sides of the valleys of the rivers Dordogne and Vézère, and not only afford cumulative evidence of the co-existence of man with the extinct mammalia, but also give us a clue to the characteristics of the race that so existed, presenting as vivid a picture of the life of that period as the one given us of Italian manners of the first century by the discoveries in the buried cities of Herculaneum and Pompeii. The old floors of human occupation consist of broken bones of animals killed in the chase, mingled with rude implements and weapons of bone and unpolished stone, and with charcoal and burnt stones which indicate the position of the hearths. Flakes without number, awls, lance-heads, hammers, and saws, made of flint, are mixed with bone needles, sculptured reindeer antlers, arrowheads, harpoons, and bones of the reindeer, bison, horse, ibex, saiga antelope, and musk sheep. These heaps mark the site of the habitations of the ancient hunters, and are simply the refuse cast aside by them. The reindeer, which then probably lived in France in great herds, formed the chief article of food. Relics of the cave bear and the lion have been met with in one locality, of the mammoth in five, and their remains bear marks of cutting and scraping which show that they fell a prey to hunters. Beside the figure of the mammoth already referred to, we may mention also the outline of an ox on a piece of antler, on another the figure of a man standing close to a horse's head, and on the other side of this same cylinder two heads of bisons drawn with great clearness. These drawings probably employed the idle hours of the hunters and reproduce for us the sights they witnessed in the chase. To sum up, these early dwellers in France lived by hunting and fishing; they were clad with skins sewn together with sinews or strips of intestines; they had no domestic animals, and were not acquainted with spinning or the potter's art. It has been confidently asserted that this people is to be connected with the Eskimos, the arguments in support of this view being set forth as follows: The bone needles, and many of the harpoons, flint spear-heads and the like, found at Perigord, are of precisely the same form as those now in use among the Eskimos. Again, the artistic designs from the caves of France, Belgium, and Switzerland are identical in plan and workmanship with those of the Eskimos, with this difference only, that the hunting-scenes familiar to the one were not known to the other. The reindeer, however, which both knew, is represented in the same way by both. The habit of accumulating large quantities of bones round their habitations and of splitting the bones for the sake of the marrow is the same with both. These and other facts, it is argued, can hardly be mere coincidences arising from the circumstance that the two peoples led a savage life under similar conditions. Hence it is urged that so far as our evidence goes as to the racial affinities of the cave-dwellers, that evidence points only to the Eskimos.

In the caves of Kentucky, half-burnt torches of cane, utensils, ornaments, braided sandals, and other signs of prehistoric occupancy have been found. In Brazil, celebrated bone-caves exist in the upper São Francisco basins, which have been especially studied by the Danish naturalist Lund. In some the remains of extinct animals of high antiquity have been found, as of the mastodon, glyptodon, toxodon, and megatherium, with which the stone implements and remains of man have been so buried as to point to the co-existence of man and these animals. In the Delaware valley near Trenton, and on the Little Miami River, in Ohio, and at Little Falls, Minnesota, palæolithic remains have been found, consisting of portions of skulls and implements made of different materials; at Trenton, chiefly of argillite, in Ohio of black chert and a hard dark pebble, and in Minnesota of quartz. Prof. F. W. Putnam having compared these with specimens from France and England, concluded that they bore similar marks of human workmanship, "so evident and so uniform in their character as to leave the supposition of their having been the result of accident altogether out of the question." See the articles TROGLodyTES and PETRA for cave-dwellers of historical times. Within the period covered by authentic history, caves have been used either permanently as dwelling-places or occasionally as retreats in time of danger, while others have been used as cells, hermitages, places of worship or burial places. Artificially excavated caves are not uncommon in the cliffs of Scottish river ravines, as at Hawthorden near Edinburgh and in the valley of the Jed, in Roxburghshire. Such caves usually occur in soft rocks like sandstone. In the Canary islands, the Guanches have excavated caves under the lavas, by raking out the loose scoræ and cinders which so commonly occur in that position. Vast areas in central China are covered with a coherent loam, in which dug-out habitations are of common occurrence. A similar deposit in this country exposed along the bluffs of rivers has been utilized in the same way by early inhabitants. In Arizona, parts of Colorado, Nevada, Utah, and southeastern California, the rocky, precipitous walls of deep cañons are in places riddled with human habitations, whose builders perhaps are likewise the builders of the pueblos, or stone ruins in the valleys. Some assume them to have been the ancestors of the present Pueblos, others make them akin to the Aztecs. The use of caves for hermitages belongs to all ages, and caves of very different kinds have been so employed, so that we are presented with every variety of artificial rock excavation, from simple hollows scraped out of some soft, yielding material, to the richly ornamented grottoes and temples of Ellora (q.v.), which are cut out in red granite.

CAVES, or **CAVERNS** (Lat. *cavus*, hollow), are hollow places in the earth. They are either natural or artificial. Natural C. have been produced by the fracture and dislocation consequent on the upheaval of the strata, by water, or by both causes combined. The denuding or eroding power of water, which has produced the materials of stratified rocks, has formed caverns in the courses of rivers and on the coast-line of the sea. The moving waters, carrying with them gravel and sand, enter natural cracks and crevices, and, by abrading their walls, increase their size, so as to form C.; or they attack less indurated portions of the solid strata, and form cavities bounded by the harder rock. Such caverns are of frequent occurrence round the shores of Britain, and indicate, where they occur, an ancient sea-margin of the island. In limestone rocks, the destroying power of water is increased when it contains chemical agents which have the power of dissolving the substance of the rock, and so causing it to be carried off in solution by the water.

C. most frequently occur in limestone rocks. They especially abound in the oolitic limestone, which on this account was called by the earlier continental geologists "cavern limestone." The celebrated C. of Franconia in Germany, of Kentucky (q.v.) in America, that of Kirkdale in Yorkshire, and many others, occur in this formation. Next to limestone, the triassic measures, containing rock-salt, a material easily removed by water, most abound in caverns. They are also frequently met with in igneous rocks—the picturesque cave of Fingal, in Staffa, is formed in basalt; and in South America and Iceland the modern lava contains large caverns.

Many caverns have a calcareous incrustation lining their interior, giving them a gorgeous appearance. Sometimes this deposit is pure white, and has, when the cave is lighted up, a richness and transparency that cannot be imagined. It is, however, more generally colored by the impurities which the water has taken up from the superincumbent strata. To the incrustations which are suspended from the roof, like icicles, the name stalactite is given, while those rising from the floor are designated stalagmites. Sometimes the pendent stalactite is produced so as to meet the ascending stalagmite, and form pillars, as if to support the roof, as in the "organ" in the Blue John Mine, Derbyshire. The source and origin of this deposit has been satisfactorily explained by Liebig as follows: The mold of the superficial soil, being acted upon by moisture and air, evolves carbonic acid, which is dissolved by rain. The rain-water thus impregnated, permeating the calcareous strata, has the power of taking up a portion of the lime, which it retains in a liquid condition, until from evaporation the excess of carbonic acid is parted with, when the lime again returns to its solid state, and forms the incrustation.

C. have an additional interest to the geologist, from the occurrence in many of osseous remains under the calcareous incrustations of the floor. The bones are imbedded in mud, and frequently concreted into a firm calcareous breccia. They belong to the pleistocene period, when the C. in Europe were inhabited by large hyenas and bears. Portions of other animals inhabiting the neighborhood were dragged by them into their dens, to serve as food. In this way the bones of herbivorous and other animals are found mixed with those of the beasts of prey; they have a broken and gnawed appearance, similar to what is produced on recent bones by the teeth of a hyena. No less than 33 species of mammals and 5 species of birds have been discovered in the C. of the British islands, of which about the half still survive in Europe, while the remainder are extinct. The mammals are species of ox, deer, horse, wolf, dog, hare, fox, weasel, water-rat, mole, bat, hippopotamus, and rhinoceros, besides the hyena and bear; and the birds are species of lark, partridge, pigeon, goose, and crow.

The most productive ossiferous cavern in Britain is that of Kirkdale, 25 m. from York, in which the remains of about 300 hyenas have been detected, besides innumerable gnawed bones of those animals on which they preyed. The carboniferous limestones of Glamorganshire abound in caves which have been explored by Buckland, and more recently and thoroughly by Dr. Falconer.

Ossiferous C. occur in all parts of the globe. The fossils of those in Australia show that the fauna of the pleistocene period had a remarkable resemblance to that of the present day. The remains consist chiefly of kangaroos and allied genera of marsupials.

CAVIANA, an island of Brazil, in the mouth of the river Amazon, about 35 m. long by 20 wide; fertile and well-stocked with cattle. The little town of Robadello, on the s.e. coast of the island, is almost exactly under the equator.

CAVIARE, the salted roes of the common sturgeon (*accipenser sturio*) and other fishes of the same genus. See **STURGEON**. It is chiefly prepared in Russia, where it is greatly esteemed as an article of food. It is also used to a considerable extent in Italy and France. The species of sturgeon from the roe of which it is chiefly prepared, inhabit the Caspian and Black seas and their tributary rivers. Among them are the bielaga, or great sturgeon (*accipenser huso*), the osseter (*A. guldenstadti*), the scherg or sevruga (*A. stellatus*), and the sterlet (*A. ruthenus*). The C. made from the roe of the last-named species is esteemed particularly delicious, and is reserved for the Russian court. Astrakhan is a principal seat of the preparation of caviare. More than 400,000 lbs. of C. have been prepared in the Caspian fishery in a single year.

CAVITÉ, a t. of considerable importance on the island of Luzon, one of the Philippines. It is situated on the bay of Manila, 10 m. s.s.w. of the city of that name, of which

it forms the quarantine station. It has a large cigar manufactory, is the chief naval depot of the Spanish possessions in the east, and gives name to a province with a pop. of 57,000. The population of the town itself is some 6,000 or 7,000.

CAVOR, or **CAVOUR**, a t. of n. Italy, situated at the foot of the Alps, 7 m. s.s.e. of Pinerolo. It has manufactures of silk-twist, linens, leather, etc., and marble and slate quarries. Pop. about 8000.

CAVO-RILIEVO (Ital.). In this peculiar kind of rilievo, which was extensively employed by Egyptian artists, the highest surface of the object represented is only on a level with the plane of the original stone, the rounded sides being cut into it. The effect resembles that of a concave seal. It is correctly described as *intaglio rilievo*. A wood-cut is given in Fairholt's *Dictionary of Terms in Art* of the Egyptian king Amunoph III. in hieroglyphics.

CAVOUR, Count CAMILLO BENSO DI, a distinguished Italian statesman of the 19th c., the descendant of a noble and wealthy family of Piedmont, was b. at Turin, Aug. 10, 1810. He was educated for a military career, but his liberal tendencies being likely to prove an insuperable barrier to his promotion, he retired during the stirring events of 1830-31, and devoted himself to agriculture, in which he introduced great improvements. He was the first to use guano in Piedmont; and, at his instigation, a national agricultural society was formed. During a residence in England, he made himself intimately acquainted with the political organization of the country, and also with its industrial institutions; knowledge of which he made good use on his return to his own country in 1842. In conjunction with Count Cesare Balbo, he in 1847 established a political daily journal, in which he advocated the interests of the middle classes—a representative system, somewhat after the pattern of the English constitution, as opposed alike to absolutism on the one hand, and mob rule on the other. On his suggestion, the king was petitioned for a constitution, which was granted in Feb., 1848. As a member of the chamber of deputies, during the stormy period which succeeded Charles Albert's declaration of war against Austria in Mar., C. strenuously opposed the ultra-democrats, and counseled an alliance with England as the surest guarantee for the success of the Italian arms. In the marquis d'Azeglio's ministry, formed soon after the fatal battle of Novara, C. was successively minister of agriculture and commerce, minister of marine, and minister of finance; and in 1852 he was appointed to succeed d'Azeglio as premier. From this time until his resignation in 1859, in consequence of the conclusion of the peace of Villafranca, C. was the originator as well as the director of the Sardinian policy. Taking upon himself at different times, in addition to the premiership, the duties of the ministers of finance, commerce, and agriculture, and latterly of home and foreign affairs, he greatly improved the financial condition of the country, introduced free-trade, consolidated constitutionalism, weakened clerical influence, and made Sardinia a power of some account in Europe, by bringing her into alliance with England and France against Russia. The dispatches which C. penned in reply to those of Austria, prior to the outbreak of the Italian war, are on all hands acknowledged as masterpieces of astute diplomacy. In Jan., 1860, C. was again called upon to preside over the Sardinian government, the duties of foreign minister likewise devolving upon him, and temporarily those of the minister of the interior also. At his death (June 6, 1861), he was prime minister of the new kingdom of Italy. See MAZADE, *Cavour* (1877).

CAVY (*cavia*), a genus of quadrupeds of the order *rodentia*, regarded as the type of a family, *caviæ*, differing from the hare family (*leporidæ*), in the complete want of clavicles, in the want of growing roots to the molar teeth, and in having the incisors situated as in other quadrupeds generally, and not in the peculiar manner so characteristic of the hares. There are four molar teeth in each jaw, and in the genus *C.* these are compound; and the genus is further characterized by four toes on each of the fore-feet, and three on each of the hind-feet, by the feet not being webbed, by the females having only two teats, and by the want of a tail. One species, *cavia cobaya*, has been long well known as a domesticated animal, and has been a common pet and plaything of children in Europe, almost from the time of the discovery of America. It is sometimes called the COMMON *C.* or RESTLESS *C.*, but much more frequently receives the name of GUINEA-PIG, although it is neither nearly related to pigs, nor a native of Guinea. Perhaps *Guinea*, in this name, may be a corruption of *Guana*, the cavies, and indeed the whole family of the *caviæ*, being exclusively South American. The colors which the domesticated *C.* exhibits have never been seen in any of the wild cavies of South America; and as it is known to have exhibited the same variations of color from about the time of its introduction into Europe, it is supposed to have been long domesticated by some of the South American tribes. The Guinea-pig multiplies with a rapidity exceeding that of any other known quadruped, producing young ones when only two months old, and afterwards at intervals of two months, and from four to twelve in a litter. This extraordinary fecundity is probably not so much the result of domestication, as a provision for the preservation of the race in a wild state, the little animal being very defenseless and destitute of means of escape, the ready prey of every carnivorous beast and bird.—The other species of *C.* much resemble the Guinea-pig. Some of them are very numerous in some parts of South America, and are sought for food, although no such use is made of the domesticated cavy. See *illus.*, *RODENTIA*, vol. XII.

CAWDOR, or **CALDER**, a parish in co. Nairn, Scotland, noted as the site of Cawdor castle in which Shakespeare places the murder of Duncan by Macbeth. But the murder took place 400 years before the castle was built—which may prove that Shakespeare was “not for a day but for all time.” During the rebellion of 1745, lord Lovat was for a time concealed in this castle.

CAWK, a popular name for a massive variety of the mineral called heavy spar or sulphate of baryta. See **BARYTA**.

CAWNPORE, a city of the Doab, on the right bank of the Ganges, about 140 m. above Allahabad, at the junction of the Jumna, being separated by the river from Oude, whose capital, Lucknow, lies 53 m. to the n.e. The lat. is $26^{\circ} 29' \text{ n.}$, and the long. $80^{\circ} 25' \text{ east.}$ The stream in front, varying, according to the season, from 500 yards in width to more than a mile, presents a large and motley assemblage of steam-vessels and native craft. C., at least as a place of note, is of recent origin, being indebted for its growth, besides its commercial facilities, partly to military and political considerations. Since 1888 it has been brought into direct communication with Bombay through the opening of the railway to Jhansi, and it is one of the chief railway centres in India. In 1777, being then an appendage of Oude, it was assigned by the nawab as the station of a subsidiary force; and in 1801 it became, in name as well as in fact, British property. During the mutiny of 1857, C. was the scene of Nana Sahib's massacre of his English captives. Though C. is only 379 ft. above the sea, yet, during winter, considerable quantities of ice are made for preservation, through the exposing of water by night in shallow vessels. Pop. '91, of C. (spelt also *Khanpur*), 163,800; including cantonment, 188,712.

CAWNPORE, the district of the above-described city, in the lieutenant-governorship of the n.w. provinces. Occupying the entire breadth of the Doab, it touches at once the Jumna and the Ganges; while to the eastward it has Futtehpore, and, to the westward, Etawah and Furruckabad. With a pop. in '91 of 1,210,000, it has an area of 2,370 sq. m., stretching in lat. from $25^{\circ} 55'$ to 27° n. , and in long. from $79^{\circ} 34'$ to $80^{\circ} 37'$ east. It is an alluvial plain of great fertility. The vine is cultivated, and indigo grows wild. Besides its two mighty rivers and their navigable tributaries, the Ganges canal traverses the country for about 60 miles.

CAXAMARCA, or **CAJAMARCA**, a province in the n.w. of Peru, with a capital of its own name. It is on the e. side of the Andes, forming part of the basin of the Marañon. The province has about 213,000 inhabitants.

CAXAMARCA, or **CAJAMARCA**, a Peruvian city, the capital of the province of the same name, on the e. side of the Andes, in a fertile valley at an elevation of more than 9,000 ft. above tide, $7^{\circ} 7' \text{ s.}$ and $78^{\circ} 31' \text{ w.}$; 72 m. n.n.e. of Truxillo. The streets are regular, but most of the houses are of clay. There are two or three fine churches, a monastery, a nunnery, and the remains of the palace of Atahualpa, the last of the Incas of Peru, who was murdered there by the Spaniards in 1533. Near the city are the sulphur springs of Pultamarca, called “the Inca's baths,” which have a temperature of 156° and are much frequented. There are manufactures of wool, linen, steel, silver, etc., and a good trade with Truxillo. A railway connects C. with the port of Pacasmayo. Pop. 12,000.

CAXAMARQUILLA, a t. of n. Peru, about 15 miles from Lima. It contains interesting ruins of Yuncan Indians.

CAXATAMBO, or **CAJATAMBO**, a t. of n. Peru, in the province of Ancachs, 120 m. n.n.e. of Lima, with a pop. of about 4,000. There are silver-mines in the neighborhood.

CAXIAS, a t. in Brazil on the river Itapicuru, about 300 m. s.e. of Maranhao. It is a place of large trade in rice, cotton, cattle, etc. Pop. about 10,000.

CAXTON, **WILLIAM**, who introduced printing into England, was b. in the Weald of Kent, about 1422. The particulars of the life of this great benefactor of his country are scanty. He was apprenticed in 1439 to Robert Large, a wealthy London mercer. At the death of the latter in 1441, he went to Bruges, where in 1462 or 1463 he seems to have been governor of a chartered association of English adventurers trading to foreign parts. In 1471, C. entered the service of Margaret, the duchess of Burgundy, formerly an English princess; and apparently towards the end of 1476 he set up his wooden printing-press at the sign of the red pale in the almonry at Westminster. The art of printing he had acquired during his sojourn in Bruges, doubtless from Colard Mansion, a well-known printer of that city; and in 1474 he put through the press the first book printed in the English tongue, the *Recuyell of the Histories of Troye*, a translation of Raoul le Fevre's work. The *Game and Playe of the Chesse* was another of C.'s earliest publications; but the *Dities and Notable Wise Sayings of the Philosophers*, published in 1477, is the first book which can with certainty be maintained to have been printed in England. All the eight founts of type from which C. printed may be called black letter. Of the 99 known distinct productions of C.'s press, no less than 38 survive in single copies or in fragments only. C., who was an accomplished linguist, and translated many of the works that issued from his press, was diligent in the exercise of his craft or in translation till within a few hours of his death, which seems to have happened about the close of the year 1491. In 1877, the printer and his work were fittingly commemorated by a

typographical exhibition in London. See *The Old Printer and the New Press*, by Charles Knight (1854); *Life and Typography of William C.* (1861-63), by W. Blades; and the *Biography and Typography of C.* (1877), by the same author.

CAYAMBE, or **CAYAMBE-URCU**, a peak of the Andes, 45 m. n.e. of Quito, in Ecuador. It is of regular conical shape, 19,250 ft. high, and always capped with snow. It is especially notable for being situated almost exactly under the equator.

CAYCOS. See **CAICOS**.

CAYENNE, a fortified seaport capital of French Guiana, on the west point of an island of the same name at the mouth of the river Oyak. The roadstead is excellent, and the port commodious but shallow. C., though it is the entrepôt of all the trade of the colony, is chiefly known as a great French penal settlement. The island, 32 miles in circumference, is separated from the mainland by a narrow channel, its soil is fertile, but the climate is extremely unwholesome for Europeans, large numbers of the convicts having been carried off by various malignant fevers. C. became a French colony about 1635; deportation hither began during the first French revolution. It has a considerable commerce, exporting coffee, indigo, sugar, cotton, cacao, etc. In 1891 it was connected by telegraph with Demerara. Pop. about 8,000.

CAYENNE CHERRY. See **EUGENIA**.

CAYENNE PEPPER consists of the powder of the dried pods, and more especially of the dried seeds of different species of *Capsicum* (q.v.), particularly of *C. frutescens*.

CAYES. See **AUX CAYES**.

CAYLEY, **ARTHUR**, English mathematician, born in Surrey in 1821; was a lawyer in early life, but became professor of pure mathematics at Cambridge in 1861; lectured in U. S. in 1882. He died in 1885.

CAYLEY, **SIR GEORGE**, 1733-1857; an English physicist and inventor, whose experiments on the steam engine resulted in the invention of the air engine. Among his other inventions was an arrangement for applying the power of electricity to machinery. He was one of the originators of the London polytechnic institution, and late in life was a member of parliament for Scarborough.

CAYLUS, **ANNE CLAUDE PHILIPPE DE TUBIÈRES**, Count de, Marquis d'Esternay, Baron de Bransac, 1692-1765. When young he served with distinction in the French army, but after the peace of Rastadt (1714) he traveled extensively in Europe and the east, studying and collecting antiquities, on which he published several works. He rediscovered the method of encaustic painting with wax, mentioned by Pliny. He was also an engraver, and copied many of the famous pictures of the old masters. But he is best known as the author of several romances, humorous pieces, and fairy tales.

CAYLUS, **MARTHE MARGUERITE DE VILLETTE DE MURCAY**, Marquise de, 1673-1729; a descendant of the family of D'Aubigne, but converted by Mme. Maintenon to the Roman Catholic faith. She acquired celebrity as one of the leaders of court society. Racine so admired her abilities that he wrote the prologue to his tragedy of *Esther* as a compliment to her. Her first husband, the marquis de Caylus, was worthless and dissipated. After his death, she became the mistress of the duke of Villeroy, for which she was sent away from the court; but after the death of Mme. Maintenon she was restored to favor. Voltaire edited her *Souvenirs*.

CAYMAN, a name somewhat variously used, either as the distinctive appellation of some, or as a common name for all the *crocodilidæ* of South America. See **ALLIGATOR**. The genus *alligator* is by some naturalists of the present day divided into three genera, to one of which the name *C. (caiman)* is appropriated, and of which the type is the species called the eye-browed *C. (alligator palpebrosus)*, to which the name *C.* is distinctively applied in Surinam and Guiana, a species very abundant there, but not one of the largest or more dangerous of its tribe. It is remarkable for the three bony plates, separated by sutures only, which form each eyebrow or eyelid, projecting as large knobs like a man's fist; and this, and the scarcely webbed-feet, constitute the most important characters of the genus or subgenus *cayman*.

CAYMANS—in English, *alligators*—three low islets of the Caribbean sea, which form a dependency of Jamaica, being 130 m. to the n.w. of it. Grand C., the largest of the group, is about 30 m. long and 5 wide. Discovered by Columbus, they were by him called Tortugas, from the abundance of turtle. The soil yields corn and vegetables; and the people rear hogs and poultry; mahogany, dye-woods, and phosphates are also produced, and coconuts are exported.

CAYUGA, a co. in w. central New York, extending from lake Ontario half-way across the state, intersected by the New York Central and several other railroads; 773 sq. m.; pop. '90, 65,302. It is a fine agricultural section, with undulating surface. Gypsum, salt, and limestone are among the minerals. Near the center of the co. lies Owasco lake, about 10 m. long, and on the w. border is Cayuga lake. Co. seat, Auburn.

CAYUGA LAKE, a fine navigable sheet of water in w. central New York, 38 m. long, and from 1 to 3½ m. wide. At the n. end it is shallow, but in some places it is very deep. It is 377 ft. above tide water, and 146 ft. higher than lake Ontario, into

which it empties through Seneca river. The lake is much frequented by tourists and pleasure seekers.

CAYUGAS, one of the Indian tribes forming the Six Nations in New York. They built the villages around Cayuga lake in central New York, and, when first known by the French explorers from Canada, were able to muster several hundred warriors. The C. were, with the other Iroquois, against the French in the wars of the 17th century. A few of their chiefs became Christians; and one who was taken in war and sent to the galleys in France, on his return to Canada became a friend of the white man. In the American revolution they were on the English side. After peace, they ceded nearly all their lands to the state except a small reservation, and that they abandoned about 1800, when some of them went to the Senecas, some to Canada, and others to the Indian country. Scarcely 170 of the tribe now remain.

CAZAL/LA DE LA SIERRA, a t. of Spain, in the province of Seville, 39 m. n.e. of the city of that name. It is situated on a declivity of the Sierra Morena; the district around is mountainous and well wooded, and abounds in minerals of various kinds, including iron, silver, copper, sulphur, and marble. The inhabitants, numbering about 8500, are chiefly employed in smelting metals, manufacturing cannon, machinery, and agricultural implements. Some tanning, weaving, etc., are also carried on.

CAZALÈS, EDMOND DE, French political writer, 1804-76; studied law and received a legal appointment, but soon gave his chief attention to political affairs, being largely occupied with the question of the reconciliation of the Roman Catholic church with the principles of the Revolution. In 1843 he took holy orders, and two years later became the director of the ecclesiastical seminary of Montauban. He was active during the revolution of 1848 and in the events of 1871-72. Among his writings are various articles in periodicals, *A Historical and Critical Study of Contemporary Germany*, in 1853, and *Our Evils and their Remedies*, in 1874.

CAZALÈS, JACQUES ANTOINE MARIE DE, French politician, 1758-1805. He won some distinction as an orator, and pleaded the royalist cause in the National Assembly in 1789.

CAZEMBE, or KAZEMBE, a country in central Africa, n. of lake Bangweolo, taking its name from the title of the ruler. The district is included in the British South Africa company's territory. Cazembe is also the name of a native village near the southern end of lake Moero.

CAZENOVIA, a village in Madison co., N. Y., on Cazenovia lake and the Lehigh Valley and the West Shore railroads. It is in an agricultural and dairying region, and has Cazenovia Seminary (Methodist Episcopal), public library, and weekly newspaper. Pop. '90, 1987.

CA'ZIN, JEAN CHARLES, French painter, b. about 1840; studied under Lecoq de Boisbaudran; received a medal of the first class in 1882, and became a member of the Legion of Honor in 1889. He has painted figures and landscapes, but even where figures occur the interest of the pictures is centered in the scenery; so he is properly classed with landscape painters. Among his paintings are "The Flight into Egypt" (1877), "Ishmael" (1880), "Tobit" (1880), and "Judith" (1883). Their chief merit lies in the soft and beautiful coloring.

CAZIQUE. See CACIQUE.

CAZOR/LA, a t. of Andalusia, Spain, 40 m. e.n.e. of Jaen. C., which is a place of considerable antiquity, is pleasantly situated on a declivity, and is well watered by the Vega; has two old castles—one an Arab structure—manufactures of leather, earthenware, soap, and bricks, and a trade in agricultural produce. Pop. 6200.

CAZOTTE, JACQUES, French poet, b. 1719, wrote the romance of *Olivier* (1763), *Le Diable Amoureux* (1771), *Le Lord Imromptu* (1772), etc. He was guillotined as a royalist by the revolutionary tribunal in 1792.

CEANO'THUS. See RED ROOT.

CEARA, a province of Brazil, on the n. coast, situated in lat. 2° 40' to 7° 25' s., long. 37° 40' to 41° 30' west. It has an area of 40,253 sq. m., with, '90, 881,686 inhabitants. It abounds in balsams, gums, resins, and fruits; and among its minerals are gold, iron, copper, and salt. The port of C. has an extensive harbor; is the terminus of a railroad, and has a large trade. Its pop. in 1892 was 35,000.

CEBADIL/LA. See SABADILLA.

CEBES, a Greek philosopher, disciple of Socrates, mentioned by Plato and by Xenophon as distinguished for virtue and love of truth. The work *Tabula Cebetis* attributed to him professes to be an explanation of an allegorical picture, and begins with the Platonic doctrine that men enter the earth from a pre-existent state, in which they were taught how to guide their course in this world; but the draught of oblivion, which all

must drink, though not in equal quantities, causes them to forget the instructions. Many allurements entice them to vice, but by patience and endurance they may attain to virtue and happiness. Sciences are declared not to be the true discipline, but yet to be useful, especially as restraint for the young.

CEBU, a city on the island of Cebu, one of the Philippines, 400 m. s.e. of Manila. Cebu is the oldest provincial town in the archipelago, and still ranks as one of the best built, while its position makes it the chief commercial center for the southern Philippines. It is the residence of a military governor, and an alcalde, as well as the governor-general of the Vissagas. There are exports of sugar, hemp, tobacco, Japan-wood, etc. The grave of Magellan, the navigator, is on the island of Matan, opposite the town. Pop., inclusive of the suburb of St. Nicholas, about 34,000.

CEBU, or **ZEBU**, one of the Philippine islands, between $9^{\circ} 35'$ and 11° n., and 123° and $123^{\circ} 50'$ e.; 140 m. long and from 4 to 25 wide. The surface is rough, and the soil not suited to agriculture, though there are fertile valleys producing cotton, sugar, rice, tobacco, and cocoa. The climate, though very hot, is salubrious.

CEBUS (Gr. an ape or monkey), a genus of American monkeys, characterized by a round head and short muzzle, a facial angle of about 60° , long thumbs, and a long prehensile tail entirely covered with hair. The species are numerous, all of very lively disposition and gregarious habits, living in trees. They feed chiefly on fruits, but also on insects, worms, and mollusks. They are included under the popular designation **SAPAJOU** in its wider sense, and some of them are the monkeys to which this name is sometimes more strictly appropriated. The names **SAJOU** and **SAR** are also given to some of them, and some are called **Capuchin monkeys**. One of the most common species in Guiana is the **WEEPER MONKEY**, or **WEEPER SAPAJOU** (*C. apella*).—The name **capuchin** is perhaps most frequently given to *C. capuchinus*, a brownish species, with head, feet, and hands generally black, and front, shoulders, and cheeks whitish. Some of the species of *C.* are adorned with beards.—The name *cebida* is sometimes given to the American monkeys collectively, as a family or tribe. See **MONKEY**.

CEC'CO D'ASCOLI, 1257-1327; the popular name of **FRANCESCO DEGLI STABILI**, a mediæval poet and encyclopedist. He studied mathematics and astrology, and was professor of the latter science in the university of Bologna. Having published a commentary on the sphere of John de Sacrobosco, in which he propounded bold theories concerning the employment and agency of demons, the clerical party caused him to be condemned to certain fasts, prayers, and fines; but he eluded punishment by going to Florence. His free-thinking and plain-speaking, however, raised up many enemies; he had attacked Dante's *Commedia* and his fate was sealed; an old accusation of impiety was renewed, and he was tried, sentenced, and burnt at the stake in Florence, in the 70th year of his age.

CECIDOMYIA (Gr. *kekidion*, a gall-nut; and *myia*, a fly or gnat), a genus of dipterous (two-winged) insects of the family *tipularia*—the gnat and mosquito family; having downy wings, which have three nervures, and are horizontal when at rest; antennæ as long as the body, with bead-like joints and whirls of hairs at the joints; long legs, and the first joint of the tarsi very short. The species are numerous; nearly thirty are British. All are of small size, but some of them are very important on account of the ravages which their maggots effect in grain-crops. *C. cerealis*, sometimes called the barley midge, a brownish-red fly with silvery wings, of which the maggot is vermilion-colored, is often very destructive to crops of barley and spelt in Germany. The little maggots live in families between the stalk and the sheath of the leaf, abstracting the juice of the plant.—The **WHEAT-FLY** (q.v. and the **Hessian FLY** (q.v.) belong to this genus.—Some of the species of *C.* deposit their eggs on the young buds of trees, which the larvæ transform into galls.

CECIL, a co. in n.e. Maryland, on the Delaware and Pennsylvania border, intersected by three railroads; 375 sq.m.; pop. '90, 25,851, inclu. colored. It has an uneven surface and fertile soil, its products are wheat, corn, oats, potatoes, hay, butter, and wool. Of stone and minerals there are granite, gneiss, slate, iron, chrome, and sulphate of magnesia. There are flouring mills, and several other manufactories. Co. seat, Elkton.

CECIL, RICHARD, 1748-1810; a minister of the church of England, celebrated as a pulpit orator. His works have been published in England and in New York. They are prized for deep spiritual fervor. *Memoir* by his widow.

CECIL, ROBERT, Earl of **SALISBURY**, son of **WILLIAM**, was b. about 1550. On the death of his father, having previously held important state offices, he succeeded to what would now be called the premiership. On the accession of James I., C., who had carried on a private correspondence with that monarch before Elizabeth's death, was confirmed in his office and received many high honors, culminating in that of earl of Salisbury. In 1608, he was made lord high treasurer, and the exchequer was greatly improved in his hands. C. was a man of immense energy and far-reaching sagacity, undoubtedly the best minister the country had in his time; but he was cold, selfish, and unscrupulous as to the means he took to gain his ends, and get rid of his rivals. His connection with the disgrace of Essex and Raleigh laid him open to great and deserved odium, in

50 feet. Their age is variously estimated; the rules by which botanists determine the age of trees are not applicable to them, for their stems have ceased to grow in regular concentric rings; they owe their prolonged existence to the superior vitality of a portion of their bark, which has survived the decay of the rest. Russeger is inclined to admit that these trees may possibly number some 2,000 years.

The Arabs, of all creeds, have a traditional veneration for these trees; they believe that an evil fate would surely overtake any one who shall dare to lay sacrilegious hands on the *saints*, as they fondly call them. Every year, at the feast of the transfiguration, the Maronites, Greeks, and Armenians mount to the cedars, and celebrate mass on a homely altar of stone at their feet.

The C. has been planted in parks in many parts of Europe; it was introduced into England in the latter part of the 17th c., and a tree at Sion house, London, is now 8 ft. in diameter at 3 ft. above the ground. Even in Inverness-shire it succeeds so well, that trees at Beaufort castle, the seat of lord Lovat, planted in 1783, are now 3 or 4 ft. in diameter. On its native mountains, the C. is found at the base of the highest peaks, at an altitude of about 8,000 ft. above the sea. It seems to delight in a dry open soil, where, however, its roots can have access to abundance of water. Although in foliage and some other particulars the C. considerably resembles the common larch, it differs in form and habit very widely both from the larch and from the pines in general. Its stem bears almost down to the ground irregularly placed branches, often of prodigious size and expanse, which divide irregularly into branchlets. The leaves are dark green, 10 to 15 lines long, pointed, united in clusters of 20 to 30; on the young shoots they are very numerous, and not in clusters; the small branchlets also are crowded together and pensile. The cones are erect, oval, broadly rounded at both ends, about 4 in. long, and 3 in. in diameter; their scales closely crowded, large, and broad. The cones take two years to come to maturity, and hang on the tree for years before their scales come off and their seeds are set free. The wood of the trunk is reddish, and full of a fragrant resin. The ancients kept their writings in cabinets or boxes of cedar-wood. Extraordinary indestructibility and other virtues were ascribed to it. It is not nearly so much prized at the present day, because it is soft and light, and apt to crack in drying. This inferiority is, however, not improbably owing to the inferior age of the trees from which the timber is now procured. A resinous substance, called *cedar resin*, or *cedria*, flows spontaneously from the trunk of the C., or from incisions; it resembles mastic, and was anciently used, along with other resins, in the embalming of the dead. It was also used as a medicine. In very ancient times, C. OIL, a kind of turpentine, was prepared from the wood, and was spread on books in order to their better preservation. At the present day, the oil and the resin are scarcely known. The branches of the C., like those of the larch in warm countries, exude a sweet substance, which is known by the name of C. MANNA.—The DEODAR or HIMALAYAN C. (*cedrus deodara*), a tree held in great veneration by the Hindus, and of which the name is said to be properly *devadara*, and to signify *god-tree*, is common in the Himalaya mountains, at elevations of 7,000 to 12,000 ft., forming magnificent forests, and attaining a great size, a height sometimes of 150 ft., with a trunk 30 ft. or more in circumference, an ample head, and spreading branches. It is described as having cones somewhat larger than those of the C. of Lebanon, the scales of the cones falling off as soon as the seed is ripe, and as differing from the C. of Lebanon also in more pensile branches and longer leaves; but Dr. Hooker expresses a strong opinion that they will prove to be really the same species, as well as the C. of ALGIERS (*C. Atlantica* or *Africana*), which is found in the mountainous regions of the n. of Africa. The wood of the deodar is resinous, fragrant, compact, and very durable. It is susceptible of a high polish, and in its polished state has been compared to brown agate. Owing to the abundance of resin, laths of it burn like candles. Its turpentine is very fluid, and although coarse, is much used in India for medical purposes; and tar and pitch are obtained from the trunk. The deodar has now become very common as an ornamental tree in Britain, although few specimens have yet attained a very considerable size. On account of its extreme gracefulness when young, it is often planted in situations to which large trees are unsuitable, and is to be seen in many suburban parterres.—The name C. is often given to other coniferous trees besides the true cedars. Thus, the Siberian stone pine, or Cembra pine, is called the SIBERIAN C. (see PINE), and a species of fir (*abies religiosa*) is the RED C. of California (see FIR). A species of cypress (q.v.) is known as WHITE C., and another as the C. of GOA. Several of the trees which bear the name C. are species of juniper (q.v.), among which are the VIRGINIAN C., or RED C. of North America, and the BERMUDA C.—which yield the cedar-wood used for pencils—the SPANISH C. of the s. of Europe, etc. The name C. is even given to trees which have no resemblance to the true cedars, except in the resinous quality of the wood; thus the cedar-wood of Guiana is produced by *iceia altissima*, a tree of the natural order *amyridaceæ* (q.v.); the C. of the West Indies belongs to the natural order *cedrelaceæ*; and the name BASTARD C. is given in India to a tree of the natural order *byttneriaceæ* (q.v.).

CEDAR BIRD. See WAXWING.

CEDAR CREEK, a stream in Shenandoah co., Va., falling into the Shenandoah river. On this creek, Oct. 19, 1864, the confederates, under Gen. Early, surprised Sheri-

dan's (union) camp, during that officer's absence. The unionists were compelled to retreat. Gen. Sheridan, who was at Winchester when he heard of the disaster, hastened to the front, and, rallying his forces, in turn surprised the confederates who had stopped to plunder the union camp, recovered nearly all that had been lost, took 2,000 prisoners, and 50 pieces of artillery, and the next day cleared the valley of the Shenandoah of confederate troops. This brilliant achievement was the theme of T. Buchanan Read's stirring poem, *Sheridan's Ride*.

CEDAR FALLS, a city in Black Hawk co., Iowa, on Cedar river and the Illinois Central, the Burlington, Cedar Rapids and Northern, and the Chicago and Great Western railroads, 93 m. from Dubuque. It is a manufacturing place of importance, having good water-power, and a variety of mills, and has the State Normal School, a high school, public library, national bank, and daily, weekly, and monthly periodicals. Pop. 1890, 3459.

CEDAR MOUNTAIN, a hill in Culpeper co., Va., near which, Aug. 9, 1862, there was an engagement between the federal forces under Gen. Banks and the confederates led by Gen. Jackson. The confederates had the advantage and held the field, but two days later fell back towards Gordonville to join Gen. Lee. The reported losses were: on the union side, 1400 killed and wounded, and 400 prisoners; of the confederates, 1283 killed and wounded, and 31 missing.

CEDAR MOUNTAINS, a range of the Cape colony, parallel with the Atlantic, and nearly half way between it and the dividing ridge of the country. They form the height of land between the Oliphant on the w., and the Great Thorn, its principal tributary, on the e., varying in altitude from 1600 ft. to 5,000.

CEDAR RAPIDS, a city of Linn co., Ia., on the Cedar river, 79 miles s.w. of Dubuque. The Burlington, Cedar Rapids and Northern railroad here crosses the Chicago and Northwestern, and the city is also on divisions of the Chicago, Milwaukee and St. Paul and the Illinois Central railroads. The city, which lies in a rich dairy country, contains large wholesale houses and pork-packing establishments, and the rapids furnish water-power for the numerous manufactories and the large railroad machine shops. There are churches, national banks, a high school, Coe College (Presb.), St. Joseph's Academy of the Sacred Heart (Rom. Cath.), Y. M. C. A. hall and library, public and Masonic libraries, electric lights and street railroads, Holly system of waterworks, etc. A bridge crosses the river at this point. Population, 1880, 10,104; 1890, 18,020.

CEDAR, or **RED CEDAR**, **RIVER**, rises in s.e. Minnesota, and flows s. and s.e. through more than three-quarters of the breadth of Iowa, falling into the Iowa river about 20 m. e. of the Mississippi. The entire length is about 350 miles.

CEDD, or **CEDDA**, saint, d. 664; brother of saint Chad or Ceadda, with whom he is often confused. He was b. in Northumbria; brought up by bishop Aidan; Christianized Essex and other parts of England; was made bishop of the East Saxons; founded two monasteries, and was famed in Britain and Ireland for learning and sanctity.

CEDILLA. See **DIACRITICAL MARKS**.

CEDRELA CÆ, a natural order of exogenous plants, very nearly allied to *meliaceæ* (q.v.), and chiefly distinguished by the winged seeds, numerous in each cell of the fruit, which is a capsule. The known species are few, all tropical or sub-tropical trees or shrubs, with pinnate leaves, most of them trees valuable for their timber. To this order belong mahogany, satin-wood, toon, Barbadoes cedar, the yellow-wood of New South Wales, etc. The barks of some species are febrifugal.

CEDRON, an extract of a bitter nature from a small tree growing in Central and South America. In those countries the bitter is thought to be a remedy for the bite of serpents, and a prophylactic against hydrophobia.

CEFALU', a seaport in n. Sicily, 47 m. e.s.e. of Palermo; pop. 14,000. The new town, founded in 1131 by Roger I. of Sicily, is at the base of a steep promontory which overlooks the magnificent bay of Cefalu. The houses are well built, and the cathedral, begun in 1132, is distinguished for the beauty of its façade, with antique pillars and mosaics. There is a small but good harbor, and some trade in manna, oil, and sardines.

CEG'LIE, a t. in southern Italy, province of Lecce, 18 m. n.e. of Taranto. Pop. about 14,000. It produces much grain, and has fine pastures.

CEHEGIN', a t. of Spain, in the province of Murcia, 37 m. w.n.w. of the city of that name. It has some spacious streets, with handsome buildings, and manufactures of paper, cloth, and pottery. Pop. about 10,000.

CEILING (Fr. *ciel*; Lat. *calum*, heaven). This term seems to have been suggested by the use of arched coverings for churches, and even for rooms, which prevailed in the middle ages, and was not unknown to the Romans. Whether the term was further suggested by the habit of tinting ceilings of a blue color, and decorating them with stars, or whether that usage arose from the use of the term already introduced, is more doubtful. Arched ceilings among the Romans were known by the name *cameræ* or *camera*, the Greek origin of which seems to furnish an argument in favor of the view that the arch was known to the latter people. The camera was formed by semicircular beams of wood, at small distances from each other, over which was placed a coating of lath and

plaster. In later times, the camerae were frequently lined with plates of glass; whence they were termed *vitreae*. But the ceilings most commonly in use amongst the Romans were flat, the beams, as in modern times, having been at first visible, and afterwards covered with planks and plaster. Sometimes hollow spaces were left between the planks, which were frequently covered with gold and ivory, or paintings. The oldest flat C. in existence is believed to be that of Peterborough cathedral. Like that at St. Alban's abbey, it is made of wood, and plastered over like a modern ceiling. Ceilings of churches, in the middle ages, were generally painted and gilded in the most brilliant manner; and many existing ceilings still exhibit the traces of early decoration of this kind. The older ceilings generally follow the line of the timbers of the roof, which, in the early English and decorated, are often arranged so as to give the shape of a barrel vault. In ceilings of this description there are seldom many ribs, often only a single one along the top. In the perpendicular style, the C. often consists of a series of flat surfaces or cants, formed on the timbers of the roof. Though sometimes altogether destitute of ornament, they are more frequently enriched with ribs, dividing them into square panels, with bosses (q.v.) or flowers at the intersections. Wooden ceilings are sometimes formed in imitation of stone-groining, with ribs and bosses, examples of which will be found at York, Winchester, and Lincoln. In the Elizabethan age, ceilings were generally of plaster, but they were ornamented with ribs having bosses or small pendants at the intersections. It is not unusual for the C. immediately over the altar, or the roodloft, to be richly ornamented, whilst the rest is plain.

CELANDINE, *Chelidonium*, a genus of plants of the natural order *papaveraceæ* (the poppy family), having a corolla of four petals, and a podlike capsule. The common C. (*C. majus*) is a perennial, with pinnate leaves, lobed leaflets, and yellow flowers in simple umbels, frequent under hedges, in waste places, etc., in Britain and most parts of Europe. It flowers from May to Sept. The root, stem, and leaves, when fresh, have a disagreeable smell, and are full of a yellow juice, which is very acrid, causing inflammation when applied to the skin. C. is sometimes used in medicine: it is a drastic purgative, and in large doses an active poison; in small doses it is said to act beneficially on the lymphatic system and on the organs of secretion, and to be useful in scrofulous diseases, disease of the mesenteric glands, etc. The fresh juice, applied externally to warts, corns, etc., removes them by stimulating them beyond what their languid vital powers can bear. Mixed with milk, it is applied to the eye for the cure of opacities of the cornea, but is a remedy that requires great caution in its use.

CELANO, LAKE OF. See FUCINO, LAKE OF.

CELASTRACEÆ. See SPINDLE-TREE.

CELEBES, a large island in the Eastern archipelago, e. of Borneo, between 5° 45' s. lat., 1° 45' n. lat., and 118°, 126° e. longitude. Area, 71,470 sq. miles. It is irregular in shape, and four peninsulas springing from a common root form the large bays of Gorontalo and Tolo, and the gulf of Boni. C. is covered with mountains and valleys: a chain running throughout it sends spurs into the peninsulas. Some are active volcanoes, and earthquakes are frequent. The peak of Bonthaim is 9,788 ft. high. The island has a rich soil and extensive pastures. The vegetable kingdom gives sago, cocoa-nuts, bread-fruit, coffee, tamarinds, bananas, oranges, pine-apples, maize, rice, tobacco, sugarcane, indigo, sandal-, sapan-, and ebony-wood. The animals include excellent horses, buffalo, cattle, wild swine, elands, goats, sheep, parrots, lories, birds of paradise, beautiful butterflies, wild bees, etc. The minerals are gold, iron, coal, and salt. The people spin and weave cottons. Population, of various races, was estimated at the end of 1894 to be 958,472, three-fourths of which consists of the native Malay tribes, the Buginese and the Macassars. The chief t. is Macassar, which names the strait between C. and Borneo. In Nov., 1874, a fire destroyed 774 houses of the town. C. was discovered by the Portuguese in the early part of the 16th c., the exact date being given by some authors as 1512. At that time the Macassars were the most powerful people in the island, having successfully defended themselves against the king of the Moluccas and the sultan of Ternate. In 1609 the English endeavored to gain a foothold. The Dutch arrived near the end of the 16th or the beginning of the 17th century. In 1611, the Dutch East India company obtained a monopoly of the trade on the island of Buton, and in 1618 an insurrection in Macassar gave them an opportunity of obtaining a definite settlement in Celebes. In 1660 the native kingdom was forcibly subjugated by the Dutch, with 33 ships, and 2,700 men. Six years later, the war began again, but was ended in 1667, and a treaty was signed by which the Dutch were recognized as protectors and mediators of the different states who were parties to the treaty. In 1683 the n.e. part of the island was conquered and put under the command of the governor of the Moluccas; and in 1824 the kingdom of Boni was reduced. Since that time there has been no important military event except the speedily suppressed insurrection in Boni in 1859. The island is very irregular in outline, and has been compared to a star-fish with its limbs torn away from the w. side. There are few rivers, and none are navigable for any considerable distance; but the lakes are numerous, and some of them large. The most important of these is the Tamp-arang-Labaya, or Tempe, in the s.e. section of the peninsula. It has a depth of 30 ft., and is richly stocked with fish. The scenery throughout the

island is varied and picturesque. There are wonderful gorges, chasms, and precipices, many of the latter 600 ft. high, and yet covered with a tapestry of vegetation. Much of the country is still covered with the primeval forest, which is traversed here and there by scarcely perceptible paths, or broken by occasional clearings or villages. The fauna of Celebes exhibits some specimens both of birds and of mammals peculiar to the island. The most remarkable of these are an ape found in but one other country, a small ox-like quadruped that inhabits the mountainous districts, and the pig-deer of the Malays. Neither the elephant, the tapir, the rhinoceros, nor any large beast of prey is represented. Rice, sago, maize and fruits are cultivated for domestic consumption; and coffee, sugar-cane, tobacco, cotton, nutmegs and cocoanuts, for export. Not much attention, however, has been given to agriculture, except where the Dutch influence and example are strong; and manufactures are few and crude. The women weave a tolerable cotton cloth. The houses are of wood and bamboo, and are usually very frail. The whole of Celebes is practically in the hands of the Dutch government, though but a comparatively small portion is under their direct administration, and many of the petty princes are permitted to manage their internal affairs much as they please. For administrative purposes there are three "residences," Celebes, Menado, and Ternate, the former two belonging solely to the island, while the third includes a large part of the Moluccas. The most important and interesting people in the island are those in the department of Macassar. They consist mainly of Macassars and Malays proper, of Endinese from the island of Flores, and immigrants from the neighboring kingdom of Wadjo. The foreign colonies are each under the management of a separate captain, and the Malays are under the care of a head priest. The Macassars belong to the Malay race; they are well built and muscular; with dark brown complexion, a broad and expansive face, black and sparkling eyes, high forehead, nose rather flat, large mouth, and black soft hair which they let fall over their shoulders. The women are sprightly, clever and amiable, and formerly brought large prices as slaves. The men are brave, ambitious, jealous, and revengeful, but not treacherous. Drunkenness is rare, but gambling and cock-fighting are passionately engaged in. Running "amok" was once so common that the Dutch dismissed the Macassar soldiers from their service to break up the evil. They take great pleasure in all bodily exercise. In religion they call themselves Mohammedans, but their worship is full of pagan superstitions; they worship animals and a divinity called Kareng Lové, who has power over their fortune and health. Their language, which belongs to the Malayo-Javanese group, is spoken by about 300,000; but it has a much smaller area than Buginese, which is the language of Boni. Their literature is poor, and consists mainly of romantic stories from the Malay, and religious treatises from the Arabic. Of their few original works the most important are the early histories of Goa, and some other states of the Celebes, and a collection of laws and maxims of the old princes and sages. In no part of their possessions, however, have the Dutch made more important transformations than in Minahassa, or the confederation of Manado. At the beginning of the century the people were still savages, and in almost continual warfare among themselves. About 1822, it was discovered that the soil of the mountain sides was very favorable for growing coffee; the cultivation was introduced, and a system established by which the native chiefs undertook the management of the plantation. The result has been not only to make one of the best coffee districts in the archipelago, but wonderfully to advance the civilization of the inhabitants. Missions and education have been successful; villages of handsome houses have grown up; the country is traversed by roads shaded by trees, and rivers have been bridged. The trade of the district is in a flourishing condition, and promises to become still more important. The coffee plant produces a fine kernel of transparent greenish-blue color, and brings a much higher price than that from Java. Besides other large district divisions, for the most part physically similar to those described, there is the district or state of Toradja, lying entirely inland, which is in possession of a wild pagan race, perhaps aboriginal. See *ILLUS., JAVA, ETC.*

CELERES, a body-guard of 300 young men of the best Roman families, organized, according to tradition, by Romulus. Next to the king, their leader was the highest officer of the state. This position was held by Brutus when he expelled the Tarquins.

CELERY, *Apium*, a genus of plants of the natural order *umbelliferae*, distinguished by a mere rudimentary calyx, roundish entire petals, very short styles, and roundish fruit. The common C. (*A. graveolens*) is found wild in Britain and most parts of Europe, in ditches, brooks, etc., especially near the sea and in saline soils. Its leaves are dark green and smooth, its petals involute at the tip. The wild plant, also called *SMALLAGE*, has a stem about 2 ft. high, a tapering slender root, a penetrating offensive odor, a bitterish acrid taste, and almost poisonous qualities. By cultivation, it is so much changed that its taste becomes agreeably sweetish and aromatic, whilst either the leaf-stalks much increase in thickness, or the root swells in a turnip-like manner. These parts, blanched, are much used as a salad, or to impart flavor to soups, etc., and sometimes as a boiled vegetable. They contain sugar, mucilage, starch, and a substance resembling manna-sugar, which acts as a stimulant, particularly on the urino-genital organs, so that a very free and frequent indulgence in the use of C. cannot, in ordinary circumstances, be altogether favorable to health. Two principal varieties of C. are cul-

tivated, that most common in America having long thick leaf-stalks, which are more or less tubular, sometimes almost solid, and, after blanching, either white or more or less tinged with red; whilst the other, called TURNIP-ROOTED C., or CELERIAC, is chiefly remarkable for its swollen turnip-like root, and is in most general cultivation on the continent of Europe. The "red" varieties of C. are esteemed rather more hardy than the "white." The blanching of the leaf-stalks is generally accomplished by drawing up earth to the plants, which are transplanted from the seed-bed into richly manured trenches; and as they grow, the trenches are filled up, and the earth finally raised into ridges, above which little more than the tops of the leaves appear. C. is thus obtained for use throughout the winter. In the northern parts of Britain, the seed is generally sown on a hot-bed. C. seed is often used for flavoring, when the leaf-stalks cannot be obtained.—Another species of C. (*apium australe*) grows abundantly in wet places on the shore about Cape Horn and in Staten Island. It is a large, hardy, and luxuriant plant.

CELESTE, MADAME, b. 1814; a dancer and melodramatic actress of French descent, and a pupil of the Paris conservatory. She came to the United States about 1829, and not long after married a man named Elliot. After his death she went to England, and in 1830 began a career of remarkable success in the sensational drama of *The French Spy*. She made two other American tours, 1851 and in 1865. In 1866, she returned to England and retired from the stage. She d. 1882.

CELESTIAL EMPIRE. See CHINA.

CELESTINE, a mineral bearing the same relation to strontia (q.v.) that heavy spar bears to baryta. It is essentially sulphate of strontia StOSO_3 , with occasional admixture of sulphate of baryta, carbonate of lime, oxide of iron, etc., in small proportions. It much resembles heavy spar, but is not quite equal to it in specific gravity; is usually blue, often of a very beautiful indigo-blue; sometimes colorless, more rarely reddish or yellowish. Its crystallization is rhombic, like that of heavy spar. Most beautiful specimens of crystallized C. are found in Sicily. C. derives its name from its color. It is used as a source of strontia.

CELESTINE, the name of five popes. 1. **SAINT CELESTINE**, d. 432, is supposed to have been a near relative of the emperor Valentinian. He held the council of Ephesus in 431, at which the Nestorians were condemned; actively persecuted the Pelagians; struggled for Roman orthodoxy; sent Palladius to Scotland, and Patricius (St. Patrick) to Ireland; raged against the Novatians in Rome, imprisoning their bishop, and forbidding their worship, and was intolerant of the least innovation of the constitutions of his predecessors. His papacy lasted nearly $8\frac{1}{2}$ years. 2. **GUIDO DI CASTELLO**, chosen in 1143; d. 1144, after a reign of 5 months and 13 days. He gave absolution to Louis VII. of France, on the king's humble subjection, and removed the papal interdict from that country. 3. **GIACINTO BOBONE ORSINI**, elected Mar. 30, 1191; d. 1198, after ruling nearly 9 years, and was buried in the Lateran; supposed to have been 90 years old when chosen. He crowned the emperor Henry VI. of Germany, and subsequently excommunicated him for keeping Richard I. of England in prison. In 1192, he confirmed the statutes of the Teutonic order of knights. 4. **GOFFREDO CASTIGLIONE** of Milan, a nephew of Urban III. He was elected pope by only seven cardinals, Sept. 22, 1241, and occupied the chair only 17 days, dying Oct. 8, before he was consecrated. He was the author of a history of Scotland, in which country he was once a monk. 5. **PIETRO DA MORONE**, the son of a peasant of Naples; became a Benedictine monk, and lived many years in caves after the manner of John the Baptist. Terrible stories are told of the severity of his penitential discipline. During his hermit life he founded the order that bears his name (see CELESTINES). After the death of Nicholas IV. he was elected pope, but refused to accept until persuaded by a deputation of cardinals reinforced by the kings of Naples and Hungary. He was chosen July 7, 1294, was crowned Aug. 29. He issued two decrees; one confirming that of Gregory X. ordering the shutting up of the cardinals when in conclave, and one declaring the right of any pope to abdicate at pleasure—a right which, after ruling 5 months and 8 days, he exercised, Dec. 13, 1294. In his document of renunciation he assigned as the moving causes "the desire for humility, for a purer life, for a stainless conscience; the deficiencies of his own physical strength; his ignorance, the perverseness of the people, and his longing for the tranquillity of his former life." Having divested himself of every outward symbol of dignity, he returned to his old solitude; but he was not permitted to remain; his successor, Boniface VIII., sent for him, and, despite his efforts to escape, imprisoned him in a castle, where, after languishing ten months in the infected atmosphere, he died, May 19, 1296. He, like the first of the name, is recognized as a saint by the Roman church.

CELESTINES, an order of hermits of St. Damianus, founded by Peter de Morrone about 1264, and confirmed as a monkish order by Urban IV. in 1264 and 1274. They called themselves C. when their founder ascended the papal chair under the name of Celestine V. They are regarded as a branch of the great order of St. Benedict, whose rule they follow; they wear a white garment with black hood and scapulary, and live a purely contemplative life. In the 13th and 14th centuries, the order rapidly spread through France, Italy, and Germany, but subsequently decayed. The French C. were

secularized by order of Pope Pius VI. in 1776-78; so also were the Neapolitan Celestines. In the present day, the order is almost extinct.

CELIBACY, from Lat. *cælebs*, unmarried. Notwithstanding the divine commendation of marriage given in the Jewish Scriptures (Gen. i. 28), the opinion had become prevalent, even before the time of Christ, that C. was favorable to an intimate union with God. This notion took its origin in the wide-spread philosophy of a good and an evil principle. The body, consisting of matter, the seat of evil, was looked upon as the prison of the pure soul, which was thought to be defiled by bodily enjoyments. Among the Jewish sect of the Essenes, accordingly, a life of C. was held to be the chief road to sanctity. These ascetic views naturally led, in the first place, to the disapproval of second marriages. While, therefore, in the first Christian churches, every one was left at liberty to marry or not as he thought fit, the objection to those who married a second time had become so generally spread, that the apostle Paul saw occasion to counsel such Christian converts as were in widowhood to remain so.

By the 2d c., however, the unmarried life generally had begun to be extolled, and to be held necessary for a life of sanctity, although several, at least, of the apostles themselves had been married. Two passages of Scripture (1 Cor. vii. and Rev. xiv. 4) were specially cited as proving that C. was the genuine condition of a Christian; and with the platonizing fathers of the 2d and 3d centuries, the unmarried of both sexes were held as standing higher than the married. Accordingly, although there was no express law against the marriage of the clergy, many, especially of the bishops, remained unmarried; a second marriage was, in their case, already strictly prohibited.

As the bishops of Rome rose in consideration, and gradually developed a firmer church government, they called upon all who belonged to the clerical order to live for the church alone, and not marry. This requirement met with constant resistance; still, it became more and more the custom, in the 4th c., for the higher clergy to refrain from marriage, and from them it went over to the lower orders and to the monks. Provincial synods now began expressly to interdict the clergy from marrying. The council of Tours (566) suspended for a year all secular priests and deacons who were found with their wives; and the emperor Justinian by an edict declared all children born to a clergyman, after ordination, to be illegitimate, and incapable of inheritance. There were still, however, many married priests who resisted the law, and found encouragement in the opposition which the Greek church made to that of Rome in this matter of celibacy. The council held at Constantinople in 692, declared, in opposition to the church of Rome, that priests and deacons might live with their wives as the laity do, according to the ancient custom and ordinance of the apostles. The orthodox Greek church has continued to adhere to this decision. Priests and deacons in that church may marry before ordination, and live in marriage after it; but they are not allowed to marry a second time. However, only a priest living in C. can be chosen as bishop or patriarch.

The Church of Rome continued its endeavors to enforce the law of C.; though, for several centuries they were attended with only partial success. There still continued to be numbers of priests with wives, although the councils were always issuing new orders against them. Popes Leo IX. (1048-54) and Nicolas II. (1058-61) interdicted all priests that had wives or concubines from the exercise of any spiritual function, on pain of excommunication. Alexander II. (1061-73) decreed excommunication against all who should attend a mass celebrated by a priest having a wife or concubine. This decision was renewed by Gregory VII. in a council held at Rome in 1074, and a decretal was issued that every layman who should receive the communion from the hands of a married priest should be excommunicated, and that every priest who married or lived in concubinage, should be deposed. The decree met with the most violent opposition in all countries; but Gregory succeeded in carrying it out with the greatest rigor; and though individual instances of married priests were still to be found in the 12th and 13th centuries, the C. of the Roman Catholic clergy was established, and has since continued both in theory and practice.

The violence thus done to human nature did not fail to avenge itself in those rude times. The licentiousness and corruption of many of the priests became in many cases boundless, and it was in vain that strict individuals, as well as councils, strove against it. The alleged immorality of certain of the clergy became a reproach and by-word in the mouth of the people, and gave a powerful impulse to the religious movement that began in the 16th century. The leading reformers declared against the C. of the clergy as unfounded in Scripture, and contrary to the natural ordinance of God, and Luther set the example of marrying. This was not without effect on the Roman Catholic clergy, and the question of the abolition of C. was raised at the council of Trent (1563). But the majority of voices decided that God would not withhold the gift of chastity from those that rightly prayed for it, and the rule of C. was thus finally and for ever imposed on the ministers of the Roman Catholic church. Those who have only received the lower kinds of consecration may marry on resigning their office. For all grades above a sub-deacon, a papal dispensation is necessary. A priest that marries incurs excommunication, and is incapable of any spiritual function. If a married man wishes to become a priest, he receives consecration only on condition that he separate from his wife, and that she of her free will consent to the separation and enter a religious order, or take the

vow of chastity. The priests of the united Græco-Catholic congregations in Rome have received permission from the popes to continue in marriage, if entered into before consecration, but on condition of always living apart from their wives three days before they celebrate mass.

Notwithstanding these decisions, the contest against clerical C. has again and again been resumed, in recent times, both within and without the Roman Catholic church. In fact, all attempts at innovation within the bosom of Catholicism, connect themselves with the attack on C., the abolition of which would deeply affect the constitution and position of that church. So far back as 1817, the Catholic faculty of Tübingen expressed the opinion that compulsory C. was one of the chief causes of the want of Catholic ministers. In 1826, the Catholic clergy of Silesia put in petitions to the bishop for the abolition of C.; and unions were afterwards formed in Baden, Württemberg, Bavaria, Silesia, and Rhenish Prussia, which, along with alterations in the doctrines and ritual of the Romish church, combined attacks on the prohibition of marriage to the clergy. A work was also published, entitled *The Introduction of Compulsory Celibacy among the Christian Priesthood, and its Consequences* (Altenb. 1828, new ed. 1845), which excited great attention. At last the abolition of the law came to be discussed in the legislatures of Baden, Saxony, and other countries. The church claimed this subject as belonging exclusively to her jurisdiction, and not to that of the state; and in Württemberg the clergy induced the government to suppress the anti-celibacy society; but this only made their opponents in the press the more zealous. In France, also, the question, about 1829, was eagerly discussed. And in Spain, the academy of ecclesiastical science took the subject into consideration in a meeting held in 1842; while the Portuguese chambers had previously, in 1835, discussed it, though without result. The same took place in Brazil, about 1827.

During the commotions of 1848, the subject was again brought into prominence in Germany. The German Catholics (q.v.) had already abolished C.; and a general measure was called for in the Frankfort parliament, in the Prussian assembly, and in the press. In Austria, also, voices were raised against it; but here the state took the side of the pope, who, in a bull of 1847, had added fresh stringency to the rule of C., and condemned its infringement. See **BACHELOR, MARRIAGE**.

CELL (Lat. *cella*, from *celo*, to conceal). The Latin word had nearly all the significations which we attach to the English one, and a good many besides which we have not borrowed. For example, the whole space between the walls of an ancient temple was called the *cella*. But the interior was frequently divided into several cellæ, in which case each C. took the name of the deity whose statue it contained, and was called the C. of Jupiter, Juno, Minerva, and the like. In these cases, the word approached to its general meaning, which, with the Romans as with us, was that of a store room, or small apartment where objects of any kind were stowed away. In modern architecture, the term vaulting C. signifies the hollow space between the principal ribs of a vaulted roof.

CELL. See **GALVANIC BATTERY**; **ELECTRO-CHEMISTRY**.

CELLARER, a person under the Roman emperors who supervised the domestic affairs of the household and examined accounts. The same title was given in later times to the purveyors for monasteries or priests. As an officer of a monastery the C. regulated every matter affecting provisions.

CELLE, or **ZELL**, a t. of Hanover, on the left bank of the Aller, which at this point becomes navigable, 23 m. n.e. of the city of Hanover. It is situated in the midst of a sandy plain, well built, and has a gymnasium, library, and a palace with a garden, in which Matilda, sister of George III., is buried. Pop. '90, 18,901. The inhabitants are very industrious. The chief manufactures are linen, hosiery, tobacco, wafers, soap, etc.

CELLINI, **BENVENUTO**, a celebrated Italian gold-worker, sculptor, founder, and medallieur, remarkable not only for his skill as an artist, but also for his checkered life, was b. at Florence in the year 1500, and first displayed skill as a chaser and gold-worker. His autobiography is a remarkably curious and interesting work, presenting us with a complete picture of the author's life and character; his activity, his extraordinary weaknesses, the impetuosity of his passions, the perilous circumstances in which his quarrelsome disposition placed him (for C. thought nothing of committing manslaughter in a moment of rage), and the ludicrous vanity and credulity which are never absent from him. The book is also of great value in a historico-social point of view, but does not impress us favorably in regard either to the personal or social morals of the time.

At an early period, having been banished from Florence in consequence of an "affray," C. went to Rome, where he was employed by many distinguished patrons of art, but afterwards was allowed to return to Florence. Another "affray" compelled him to flee to Rome a second time, where he secured the favor of Clement VII. C., by his own account, was as great in arms as in art; he declares that it was himself who killed the constable Bourbon and the prince of Orange at the siege of Rome. His reckless conduct for some years compelled his constant shifting between Rome and Florence, Mantua, and Naples. In 1537, he went to the court of France, where he was very honorably received. Illness, however, induced him to return yet once more to Rome, where he had the misfortune to be imprisoned on a charge of plundering the treasures in the

Castle of St. Angelo during the siege of Rome. At length he was liberated, through the intercession of the cardinal of Ferrara, for whom he executed, out of gratitude, a fine cup, and various other works. He now accompanied his deliverer to France, and entered the service of Francis I.; but having incurred the displeasure of the ruling favorite, Mme. d'Estampes, he returned to Florence—not, however, until, as usual, he had settled some matters with his “sword”—where, under the patronage of Cosmo de' Medici, he executed several fine works in metal and marble—among them, the celebrated bronze group of “Perseus with the Head of Medusa,” now in the market-place in Florence. Among other preserved works of C., the splendid shield in Windsor castle may be noticed. In his 58th year he began to write his autobiography, and died in 1570 or 1572. In 1876, a number of C.'s original papers were found. See Symonds' trans. of C.'s work (1887), and the monograph by Plon (1882).

CELLS, in Physiology.—I. **ANIMAL CELLS.**—On examining, under a high magnifying power, any of the constituents of the animal body, we perceive that the smallest parts which appear to the naked eye as fibers, tubes, etc., are not ultimate elements in respect to form (morphotic elements), but that they contain and are built up of certain extremely minute particles, which differ in different organs, but always have a similar appearance in the same organs. By far the most important of these microscopic forms, which are known by histologists as “simple elementary parts,” are the C., which not only form the starting-point of every animal and vegetable organism (the ovum in either kingdom of nature being simply a cell), but also—either as C., or after having undergone certain modifications which will be presently described—make up the tissues and organs of the perfect animal. Indeed, some of the lowest plants (red snow, gory dew), and of the simplest forms of animal life (Gregarinidæ, q.v., etc.), appear to consist of a single cell.

While in plants the elementary parts generally unite directly with one another, in animals they are usually combined by an interstitial substance, which may be either solid or fluid, and is always derived from the blood or general nutritive fluid. If this interstitial substance take a part in the formation of the C., it is called a cytoblastema or a blastema, from *kutos*, a cell or vesicle, and *blastema*, germ substance; if it has nothing to do with their maintenance, it is called the matrix. The cytoblastema is usually fluid, as in the blood, chyle, etc.; while the matrix is solid, as in cartilage, bone, etc.

In every cell, we can distinguish, if we use sufficiently high magnifying powers, a membranous envelope, known as the cell-wall or membrane, and certain contents. The latter are fluid or gelatinous, and besides containing particles or granules, usually exhibit a peculiar rounded body, the nucleus; which, again, contains in its interior a fluid and a still smaller corpuscle, the nucleolus.

The fundamental form of the cell is spherical or lenticular; it is such in all young C., and is persistent in those which occur in fluids, as, for example, the blood-corpuscles. Amongst other well-known forms may be mentioned: the polygonal, as in pavement epithelium, or the pigment of the eye; the conical or pyramidal, as in ciliated epithelium; the cylindrical, as in cylinder epithelium; the fusiform, or spindle-shaped, as in contractile fiber-cells; the squamous, as epidermic scales; and the caudate, polar, or stellate, as the C. in the gray nervous tissue.

With regard to size, the largest animal C.—excepting the unicellular organisms—are the yolk-cells of the ova of birds and amphibia, while the blood-cells of certain animals may be taken as representing the smallest cells. Average C. range from 0.005 to 0.01 of a line in diameter.

The cell-membrane is usually transparent and colorless, mostly smooth, and so thin as to exhibit only a single contour, rarely of any measurable thickness. No traces of structure can be detected in it. The granular appearance which the membrane occasionally presents, is due to projections depending on granules lying on the inside; and it vanishes on the addition of water, which causes the cell to be distended by endosmosis. See *OSMOSE*.

C. which contain only fluid are rare (fat-cell, blood-cell); generally, besides fluid, they contain elementary granules and vesicles, and sometimes crystals. As a general rule, the number of these morphotic elements increases with the age of the cell; sometimes, however, this is not apparent, in consequence of their being grouped in a single mass around the nucleus.

The nucleus is usually spherical or lenticular, transparent and either colorless or yellowish, and ranges from 0.002 to 0.004 of a line in diameter. All nuclei are vesicles, as was originally maintained, in 1841, by Schwann (*Microscopical Researches into the Accordance in the Structure and Growth of Animals and Plants*, Sydenham society's translation, 1847, p. 173), who must be regarded as the founder of the cell-theory in its relation to animal tissues, and as has since been confirmed by Kölliker and other later observers. The contents of the nucleus usually consist, with the exception of the nucleolus, of a limpid or slightly yellowish fluid, from which water and acetic acid precipitate granular matter. In general, only one nucleus exists in each cell, except when it is multiplying (a process which we shall presently explain); occasionally, however, we meet with several nuclei—four, ten, or even twenty.

The nucleolus is round, sharply defined, and often so small as to be almost immeasurable. Nucleoli are found in most nuclei so long as the latter are still young, and in many during their whole existence. As, however, nuclei exist in which no nucleolus

can be detected, we cannot regard the nucleolus as so essential an element of the cell as the nucleus. Most commonly a nucleus contains only one nucleolus; two are not unfrequently seen; more are rare.

Our knowledge of the chemical composition of C. is very imperfect. That the cell-membrane is a protein substance (q.v.)—at all events in young C.—is obvious from its solubility in acetic acid and in dilute caustic alkalies; and the membrane of the nucleus seems to have a similar composition; while there are chemical reasons for believing that the nucleolus is composed of fat. In the contents of most C. we usually find such substances as occur in solution in the cytoblastema—viz., water, albumen, fat, extractive matters, and salts; and in the C. of secreting organs, as for instance, the liver and kidneys, we find the special secretions of those glands; in the blood-cells, we find hemato-crystalline, etc.

There are two perfectly distinct ways in which C. can be generated; they may be developed independently of other C. in a plastic fluid (the cytoblastema); or they may be developed from pre-existing C. by cell-multiplication, the existing C. either producing secondary C. within themselves, or multiplying by division. In both these latter kinds of cell-development, the nucleus seems to be the center of development of the young cells.

In order that free or independent cell-development shall take place, we must have a cytoblastema containing protein substances (probably fibrin), fat, and certain salts (especially phosphates) in solution; and very possibly the presence of the particles of pre-existing C. may also be necessary, in which case free cell-development ceases to exist. The chyle and lymph corpuscles may be mentioned as examples of this mode of cell-formation. The steps of the process are not very clearly made out, but we know that the nuclei are first formed, and that the cell-membranes are developed around them. Free cell-development is far less common in man and the higher animals than cell-multiplication, and, we believe, never occurs in the vegetable kingdom. All pathological cell-formations—the C. in pus (q.v.), and in other morbid exudations—come, however, under this head.

The development of C. within other C. is of very common occurrence. An original or parent cell produces two or more secondary or daughter C., and the process of formation is said to be endogenous. Cartilage-cells afford a good example of this process. The nucleus and the contents of each parent cell undergo division into two parts, so that the number of C. is successively doubled. The mode in which the multiplication of the nucleus takes place cannot be definitely made out in all cases, but when clear observation is possible, the nucleoli first divide into two, and then separate.

A multiplication of C. by division has been proved to take place in the red blood-cells of the embryos of birds and mammals, and in the first colorless blood-cell of the tadpole, and very probably occurs extensively in many embryonic and adult tissues, in which a self-multiplication of C. is certain, but where no parent C. with secondary C. can be detected. In this and similar cases we have an elongation of the cell, and the single nucleus becomes divided into two; the cell then suffers constriction in the middle, which proceeds till it finally separates into two parts, each of which contains a nucleus. This variety of cell-formation affords a good illustration of the doubt and difficulty connected with this class of investigations. It was altogether unknown to Schwann when he published his great work in 1839, and was first noticed and described by Remak in 1841, who, however, subsequently retracted his published view, and did not again advocate it till Kölliker confirmed his observation, and declared it to be correct.

No satisfactory theory has been propounded with the view of explaining the development of cells. Schwann compares the formation of C. with that of crystals, but it must be recollected that the molecular attraction concerned in the formation of C. is so far peculiar, that—1. It never produces geometrical solids, but even in the nucleus and nucleolus determines a globular form; 2. That it aggregates not homogeneous, but chemically different substances; and 3. That the final result of its action—namely, the cell—is extremely limited in size, while a crystal may be of a comparatively indefinite magnitude.

The growth of C. requires some notice. Growth probably occurs in all C., although not in all to the same extent. It is most obvious in those which are formed directly round a nucleus, since in these the membranes which at first closely invest the nucleus, in time become distended and enlarged, and merely remain in contact with the nucleus at one point. Growth may take place either in surface or in thickness. The former is most commonly general—viz., in all those cases where C. increase without altering their form; but is sometimes partial—viz., in those cases in which the cell deviates considerably from the primary globular form. The latter occurs to a certain degree in all C., but in some kinds to a far greater extent than in others. The nuclei and nucleoli also take part to a certain extent in the growth of the cells. Schwann gives the following general explanation of the process of growth. He considers that the molecules of the cell-membrane exert an attractive influence on the fluid which surrounds them, and deposit its newly formed particles amongst themselves. If the deposition take place between the molecules already present in the substance of the membrane, the cell

becomes distended; if it take place only in one or more definite directions, the membrane becomes thickened.

Having now traced the cell to the period of its full growth, we are prepared to consider the processes which occur in the anterior of this minute organic structure, or, in other words, the physiology of cells. To enter satisfactorily into this subject, we ought to have an exact knowledge of the chemical composition of the contents of different cells. All that we know of the contents of C. generally is, as we have already stated, that they usually consist of a moderately concentrated solution of protein matters, with alkaline and earthy salts, and dissolved or suspended fat-particles; and that besides these ingredients many C. contain either a great preponderance of one of these constituents, to the almost entire exclusion of others, or are found to contain altogether new substances. Thus, there are C. with much protein matters, as the nerve-cells, and with much fat, like the fat-cells; while there are other cells which specially contain hæmatine (the red coloring matter of the blood), pigment, biliary and urinary constituents, mucus, milk, sugar, etc.

The main cell-processes occurring in these variously constituted C. are absorption, secretion, and excretion. These depend principally, if not entirely, upon chemical and physical laws, and are to a great extent amenable to micro-chemical observation.

Absorption, or the appropriation of matters from without, is most manifest to those C. which at first have little or no contents save the nucleus. Although endosmosis must be taken into account as a condition of absorption, C. must not be regarded merely as vesicles provided with indifferent porous membranes; for the filling of C. does not take place by their admitting every kind of matter indiscriminately; but they have the power of taking up one constituent, and rejecting another, and thus exhibit a selective faculty.

The cell having thus become filled from without, we have next to inquire into the changes which take place in the membrane and in the contents. As regards the former, the membranes of most C. not only become denser and more solid with age, but they undergo changes in their chemical constitution. Thus, in the horny tissues, the young C. are easily soluble in alkalis and acids, while older C. of the same nature are scarcely affected by these re-agents; again, in cartilage C., the membrane not only becomes firmer with age, and thickens as ossification proceeds, but is changed into a tissue yielding gelatine or glue on boiling, which subsequently becomes impregnated with salts of lime (phosphate and carbonate). See BONE.

The function of secretion is mainly carried on by changes in the contents of the C. Thus, mucous is formed in the epithelial C. of the mucous membranes, pepsin in those of the gastric glands, bile in the C. of the liver, and sepia in the C. of the ink-bag of the cuttle-fish. In these cases, the C. do not separate mucus, pepsin, etc., from the blood, but merely the materials from which they elaborate these substances. In other cases, as, for instance, in the C. of the kidney, the function of these minute organisms is not to manufacture new products, but merely to separate certain substances (urea, uric acid, etc.) from the blood, which, if not immediately removed from the general circulation, would speedily accumulate, and act as a deadly poison. That these C. merely separate the urea from the blood, and do not form it in their interior, is proved by the fact that, if the kidneys of an animal are extirpated, the urea and other urinary constituents may speedily be found in large quantity in the blood.

Excretion takes place by the bursting or solution of the distended secreting cell, usually into the duct of a secreting gland. The reader who desires further information on the functions of the C. in relation to secretion and excretion, is especially referred to an admirable memoir by prof. Goodsir, "On Secreting Structures," published in John and Harry D. S. Goodsir's *Anatomical and Pathological Researches*, 1845.

In conclusion, we must notice the metamorphoses of C. The ovum itself is, as we have already mentioned, merely a nucleated cell; after impregnation, a number of secondary C. are formed within it, by a process of cleavage or segmentation. See GENERATION; REPRODUCTION. Some of the C. which occur in the ovum in its early stages soon coalesce with others to form the higher elementary parts, which we shall shortly enumerate; others, without entering into combinations, more or less change their previous nature, as the horny plates of the epidermis and nails; while others, again, undergo no change of form throughout the period of their existence.

The permanent C. are arranged by Kölliker (*Manual of Human Histology*, translated by Busk and Huxley, 1853, vol. i. p. 47) under the following heads:

1. *True Cells*, which have in no essential respect altered their cellular character. These occur in the epidermis and the epithelium; in the blood, chyle, and lymph; in the glandular secretions, in the fatty tissue, in the gray nervous substance, in the glands (liver, spleen, etc.), and the cartilages. Their varieties of form and contents have been already noticed. Regarding their modes of occurrence, some are either isolated in fluids or in solid tissues; others are united by apposition, without any intervening structure, into a cellular parenchyma; while others, again, are conjoined by an intercellular substance of some kind.

2. *Metamorphosed Cells*. To these belong—the *horny scales*: flattened, polygonal, or fusiform; their membrane being fused into one mass with their contents. They occur in the epidermis, the laminated pavement epithelium, and the hair and nails. *The con-*

tractile fiber C.: fusiform, slightly flattened, considerably elongated C., whose membrane, with its soft, solid contents, is changed into a contractile substance. They occur in the smooth or involuntary muscles. *The tubules of the crystalline lens of the eye*: very elongated C., with viscid, albuminous contents. *The prisms of the enamel of the teeth*: greatly elongated, prismatic, and strongly calcified cells. *The bone C.*: thickened C. (with *canaliculi*, or minute branching canals) which have coalesced with the matrix of the bones. *The transversely striated muscular C.*: large polygonal C. whose contents have become metamorphosed into a transversely striated or striped tissue, such as is found in voluntary muscular fiber. From these C. are formed all the different fibers, net-works, membranes, tubes, etc.; in short, all the higher elementary parts of which the animal body is composed.

For further information on C. and cell-development, the reader is referred, in addition to the works quoted in this article, to Leydig, *Lehrbuch der Histologie des Menschen und der Thiere*, 1857; and to Frey, *Histologie und Histochemie des Menschen*, 1859 (translated by Barker, 1874). He will find full details on morbid cell-development (the growth of C. in tubercle, cancer, and other morbid deposits) in Vogel's *Pathological Anatomy of the Human Body*, translated by Day, 1847; and in McKendrick *On the Modern Cell-theory* (1888).

II. VEGETABLE CELLS.—In the vegetable, as in the animal kingdom, the primary form of the cell is that of a sphere. There are, however, interfering influences, which usually alter or modify the primary form, of which the most important are, (1.) Special directions assumed in the development, in obedience to a law regulating the structure of the tissue in which the cell occurs; and (2.) Obstructions to the expansion of the cell in certain directions from the pressure of surrounding cells.

The most common forms referable to the law of development are, (1.) The *spherical* or fundamental form; (2.) The *cylindrical*, in which there is a tendency to elongation in the direction of a vertical axis; and (3.) The *tubular*, in which there is an excess of development in the direction of the two transverse axes.

The secondary modifications of these forms are numerous. Thus, in lax tissues, the spherical form may become an irregular spheroid, running out into *lobed*, and even *stellate* forms, as may be seen in the pith of rushes and the stems of various aquatic plants. Again, in seeds, the hard part of fruits, etc., the mutual pressure of the C. converts the spherical into *polyhedral* forms, of which the *dodecahedron*—giving a hexagonal section, and arising from equal pressure in all directions—is the most common, although *cubic* and many other forms occasionally occur.

The magnitude of the vegetable C. is very varied. In flax, the liber-cells have been found $\frac{1}{4}$, or even $\frac{1}{2}$ of an inch in length, and the cylindrical C. of some of the confervæ are more than an inch long—although their transverse diameter is very minute—whilst, on the other hand, the spores of fungi are C. of a diameter of $\frac{1}{8000}$ of an inch. The average diameter of the C. in the parenchymatous tissues is about $\frac{1}{400}$ of an inch.

Both the cell-wall and the contents differ from the corresponding parts in animal cells. In all young C. the wall is membranous, freely permeable by water, elastic, and flexible. In many cases it retains these properties, whilst in others it becomes much modified, as the cell grows older. It consists mainly of cellulose (q.v.). As the vital and chemical phenomena exhibited by plants depend primarily upon operations in the interior of the cell, the careful study of the cell contents is of the highest importance. Of these contents, the most important are the *primordial utricle*, with the *protoplasm*, the *nucleus*, *chlorophyll corpuscles*, and *starch granules*.

The primordial utricle is a layer of substance of mucilaginous consistence (colored yellow by iodine), lining the entire wall of the young cell, but often disappearing at a comparatively early period. The protoplasm is a tough mucilaginous and frequently granular fluid, which fills up the space in the interior of the cell not occupied by the nucleus. The nucleus or cytoblast is a globular or lenticular body, identical in its character with the substance of the primordial utricle, and occurring in the protoplasm of most young cells. Little is known with certainty regarding the chlorophyll corpuscles, except that, under the influence of solar light, green coloring matter is developed from them. Of the starch granules, which are very commonly found in the cell contents, we need not speak, as they are sufficiently described in the article STARCH.

In addition to the above organized structures, we must mention as frequent constituents of the cell-contents, fluid coloring matters, essential and fixed oils, resins, sugar, dextrine, gum, alkaloids, and mineral or organic salts, which are not unfrequently found in a crystalline form, when they are termed raphides.

There are two modes of cell-development in the vegetable kingdom—viz., (1) *Cell-division*, where two or more new cells fill the cavity of the parent cell, and adhere to its membranes, appearing to divide it into compartments; and (2) *Free cell-formation*—not to be confounded with a process of the same name which is supposed to occur in the animal kingdom—in which the whole or part of the cell-contents become detached from the cell-wall and resolved into new loose C., which ultimately escape from the parent cell. The former mode universally occurs in the formation of the C. by which growth is effected; the latter occurs only in the production of C. connected with reproduction. For further information, we must refer the reader to Von Mohl's *Principles of the Anatomy and Physiology of the Vegetable Cell* (1852), and Schenck's *Handbuch der Botanik* (1889).

CELLULARES, in botany, a designation applied to those plants which consist entirely of *cellular tissue* (q.v.), without proper vessels of any kind. C., thus defined, are a subclass of acotyledonous plants, containing the orders of *lichens*, *fungi*, and *algæ*. In the system of De Candolle, however, the name C. was given to the second grand division of plants, the first being called *vasculares*, and the distinction between them being the presence or absence of vessels, the C. including all acotyledonous or cryptogamous plants. But ferns and mosses are not destitute of vessels; so that this system is not strictly accurate with regard to them; whilst, as all vessels are now known to be formed by the elongation and union of cells, the distinction between vascular and cellular tissue is not generally regarded as affording a good basis for primary divisions in the classification of plants.

CELLULAR PLANTS. See CELLS; THALLOGENOUS PLANTS; VEGETABLE PHYSIOLOGY.

CELLULAR TISSUE. This is the old term for a widely diffused animal texture, which has also received the names of areolar, reticular, filamentous, and connective tissue. If we make a cut through the skin, and proceed to raise it, we see that it is loosely connected with the subjacent parts by a soft, filamentous, elastic substance, which, when free from fat, has a white fleecy aspect. This is the tissue in question. It is also found underneath the serous and mucous membranes which are spread over internal surfaces, and serves to attach these membranes to the parts which they line. We likewise find it lying between the muscles, the blood-vessels, nerves, etc., occupying the interspaces between the different organs, and often investing each of them with a special sheath. While it thus connects and insulates entire organs, it at the same time performs a similar function in regard to the minute parts of which each organ is made up. Thus, for instance, in muscular tissue, it enters between the fibers of the muscle, uniting them into bundles; and similarly, it enters into glands, etc. This is termed *penetrating* or *parenchymal* cellular tissue.

It is not only one of the most general and most extensively distributed of the tissues, but it is continuous through the whole organism, and may be traced without interruption from any one region of the body to any other. It is in consequence of this continuity that dropsical fluids, air, etc., effused into the C. T., may spread far from the spot where they were first introduced.

On examining a fragment of this tissue, when stretched out, we see with the naked eye that it presents the appearance of a multitude of fine, soft, colorless, elastic threads, like spun glass; intermixed with these are delicate films or laminae, crossing one another in all directions, and leaving open spaces, or areolae; hence the name of areolar tissue.

A small quantity of colorless transparent fluid is always present in this tissue; when abnormally increased, it gives rise to the form of general dropsy known as anasarca. The microscopic characters of C. T. are briefly noticed in the article TISSUES, ANIMAL.

CELLULAR TISSUE, in botany, is any vegetable tissue formed of cohering cells alone, and in which there are no vessels. It is often called *parenchyma* (Gr. something spread out), although an attempt has been made to restrict that term to one kind of it, with cells of a particular form, and terms of Greek derivation have been multiplied for other kinds. The cells of C. T. vary much, both in form and size (see CELLS); but particular forms and sizes are characteristic of particular kinds or particular parts of plants. The products of the vital activity of plants are formed in the interior of cells, or by secretion from the inner side of their walls. Vessels being formed from cells, it is not easy to fix the limits between C. T. and *vascular tissue* (q.v.). Some kinds of plants, however, are entirely composed of C. T. (see next article); all consist of it in the earliest stages of their growth; none are at any time destitute of it. Fluids are transmitted from cell to cell, through the mass of C. T., passing through the walls of the cells where there are no openings that can be detected by the microscope.

CELLULOID, a remarkable modern invention, apparently capable of wide usefulness, wherever India-rubber and various kinds of cloth are now employed. Celluloid is produced by mixing gum camphor with a pulp of gun-cotton, and subjecting the combination to a high degree of pressure and heat. The result is a hard product of extraordinary toughness and elasticity. It can be made plastic again and molded into any required form. Any color can be given to it by the use of coloring matter during the process of manufacture. It is extensively used as a substitute for ivory, which it resembles so closely that it is sometimes difficult to detect the difference. It is said to equal ivory in strength and elasticity, and not to warp or discolor with time. It has proved a good material for piano and organ keys, billiard-balls, backs of brushes, looking-glass frames, handles for knives, forks, umbrellas, and many other articles. It is much cheaper than ivory, and is claimed to be better for decorative purposes. It is also used with much success to imitate tortoise-shell, malachite, amber, pink coral, and other costly materials. In imitation of tortoise-shell, it is made into combs, napkin-rings, match-boxes, card-cases, etc. Imitations of pink coral jewelry are made and sold at prices much below those of the genuine. The same is true of imitations of malachite and amber. Mouth-pieces for pipes, cigar-holders, etc., are common. It is also used as a substitute for porcelain in making dolls' heads. The frames of eye-glasses, opera-glasses, and spectacles are made of it, and it very soon became popular in

combination with linen, cotton, or paper, for shirt bosoms, cuffs, and collars. The material has a hard glistening surface, like that of newly laundered linen; is elastic and impervious to moisture, and when soiled can be renovated with a moistened sponge. There seems to be some danger in the manufacture of C. Though there have been explosions and several persons killed in one of the manufactories, it is said that with due care, and avoidance of unwarrantable experiments, the manufacture is not unsafe. C. was invented by A. Parkes, of Birmingham, in 1855 or 1856. The manufacture has been most largely developed in the U. S., where the chief seat of the industry is at Newark, N. J.

CELLULOSE is the term applied to the carbohydrate, $C_6H_{10}O_5$, which forms the mass of the cell-membranes of all plants. It is one of a class of compounds intimately connected in their chemical constitution, but presenting remarkable physical differences. Without entering into chemical details, we may mention the following points of difference between it and the chemically allied substances—sugar, dextrine, and starch. Sugar and dextrine are soluble in cold water, and occur in the cell sap in solution; starch is insoluble in cold water, but softens into a mucilage in boiling-water, and is found in granules in the cell-contents; while C. is insoluble in cold or boiling water, and, as far as is at present known, is very slightly soluble in the strong mineral acids, its only perfect solvent being a solution of oxide of copper in ammonia.

CELLULOSE, a substance designed for use in ship-building, and specially adapted to afford protection against blows, concussions, or perforations, either above or below the water-line. It consists of carbon, hydrogen, and oxygen, in the proportions in which they exist as the component parts of the cellular tissue of all plants, woods included. It composes the 'cells' of wood, as wax composes the cells of a honey-comb. It is the essential of the primary wall-membrane of the cells, isomeric with starch in its composition, and allied to starch, sugar, and inulin. Cotton and bleached flax, as well as hemp, are nearly pure cellulose. In some filter paper it has been produced almost absolutely pure. It is remarkable for its insolubility, being dissolvable only by an ammoniacal solution of copper. The material is usually made of the ground fibre of the cocoanut, with a small percentage of original fibres. It is extremely light, and has the property of rapidly swelling when wet. A cubic foot of it, as ordinarily prepared, weighs but seven and a half to eight pounds. It is practically free from danger of fire, burning very slowly and with great difficulty when compressed. The French made experiments with it by firing a 10-inch shot through a cellulose mattress. The fibres came together so rapidly that only about three and a half gallons of water per minute passed through the aperture, and it soon closed entirely. Its use was begun in 1884, and up to 1890 it had been put into about 40 vessels of the French navy, and into a number of ships in the Russian, Dutch, Japanese, and Greek navies. In 1890 its use was ordered in the construction of the vessels of the American navy. The cost as prepared for use is about \$350 a ton, or nearly \$1 a cubic foot. See **WOODITE**.

CELSUS, an Epicurean philosopher, but tinged with Platonism, lived in the 2d c. after Christ, and wrote, after 150 A.D., under the title *Logos Alethes* (the True Word) the first considerable polemic against Christianity. The book itself has perished; but considerable fragments have been preserved as quotations given by Origen in his answer, *Contra Celsum*, in eight books. In the fragments—which are very interesting, as showing the views of a heathen philosopher in regard to Christianity—C., with wit and acuteness, but without depth or earnestness of thought, prefers against the new religion charges of unphilosophicalness and blind credulity; and especially endeavors to convict Christians of self-contradiction in their spiritual doctrine contrasted with their anthropomorphic representations of Deity; in their religious arrogance contrasted with their confession of sinfulness; and in their views of the necessity of redemption. He also reproaches Christians with their party divisions.

CELSUS, AULUS CORNELIUS, a Latin physician and writer, who flourished probably in the reign of Augustus. He was called the Roman Hippocrates, because he generally followed the great "father of medicine," and introduced the Hippocratic system among the Romans. C. wrote not only on medicine, but also on rhetoric, history, philosophy, the art of war, and agriculture. His style is succinct and clear, but full of Græcisms. The only great work of his which survives, is the *De Medicinâ*, which is divided into eight books. The portions relating to surgery are exceedingly interesting and valuable, because C. has there given an account of the opinions and observations of the Alexandrian school of medicine. The first edition of the *De Medicinâ* appeared at Florence in 1478. C.'s works have been translated into several modern languages. A translation into English was made by Dr. Grieve, London, 1756. Among the best editions are those of Krause (Leip. 1766), Dr. Milligan's 2d edition (Edin. 1831), and Broca, *Conférences historiques* (1865).

CELT (Lat. *celtis*, a chisel), the name by which certain weapons or implements of the early inhabitants of western Europe are known among archaeologists. Celts are either of stone or of bronze.

Stone celts vary in length from about 1 in. to 22 in.; but the most common size is from 6 to 8 in. in length, and from 2 to 3½ in. in breadth. They are made of almost every kind of stone, and show considerable diversity of shape, almost all,

however, having more or less resemblance to the muscle-shell. The ruder celts are generally of slate, shale, schist, or grit; the finer, of flint, porphyry, greenstone, syenite, or agate. Many of the finer celts are beautifully shaped and highly polished. A remarkable example of this class, the property of sir Coutts Lindsay, found near St. Andrews, in Scotland, is described by sir David Brewster in the *Philosophical Journal* for 1823. Recently, a class of celts found in the later geological strata have excited much interest as well among archæologists as among geologists. They are obviously of the same type with the more common celts, but of ruder construction, as if fashioned by a more barbarous people. The stone C. was fastened into a handle of horn, bone, or wood. A C. of serpentine, with a handle of deerhorn, was found in one of the Swiss lakes in July, 1859, and a stone C. with a wooden handle, in the county of Tyrone, in Ireland.

Bronze celts vary in length from about 1 in. to 8 or 10 in., the most common length being about 6 inches. They are sometimes ornamented with rudely incised lines or circles, and have occasionally been found wrapped up in linen, or inclosed in bronze cases or sheaths. They show much greater diversity of shape than the stone celt. As many as four classes have been distinguished by archæologists—1st, The simple wedge-shaped C., most nearly resembling the common form of the stone celt. 2d, The wedge-shaped C., with sides more or less overlapping, and a stop ridge or elevation between the blade and the part which received the handle. 3d, The wedge-shaped C., with sides greatly overlapping, with or without the stop-ridge, but with a loop or ear upon, and parallel to, its lower surface. 4th, The socketed C., or the C. with a hollow to receive the handle, and generally with a loop or ear upon its lower surface.

Both stone and bronze celts were probably used for several purposes, serving for chisels, adzes, and axes, as well as for weapons of war, like the stone hatchets of the South Sea islanders and other savage or barbarous tribes.

CELTIBERI, a powerful people of ancient Spain, supposed to have sprung from a blending of the Iberians or Spanish aborigines with Celtic invaders from Gaul. The C. inhabited a large inland district of the peninsula, corresponding to the s.w. half of Aragon, nearly the whole of Cuença and Soria, and a great part of Burgos, but the name Celtiberia had often a wider signification, including the country as far s. as the sources of the Guadalquivir. The C. were divided into four tribes, and were unquestionably one of the bravest and noblest peoples in the peninsula. Their cavalry and infantry were equally excellent. For many years, they withstood the efforts of the Romans to subdue them, and it was not till after the campaigns of Sertorius that they began to adopt the Roman language, dress, and manners.

CELTIC NATIONS, one of the groups of the great Aryan (q.v.) family.

Languages.—In addition to the English, and retreating before it, there are at present four languages spoken in the British isles—the Irish, the Highland Scotch (or Gaelic), the Manx, in the isle of Man—all three nearly related to one another, and constituting the northern (Erse, Gadhelic) branch of the Celtic languages; whilst the fourth language, the Welsh, constitutes, together with the Cornish of Cornwall (extinct since 1778) and the Bas Breton of Brittany, the southern (Briton, Cymric, Cambrie) branch. The remains of the language of the Gauls or Celts, the ancient inhabitants of France, closely resemble the British and Gadhelic idioms; hence the name Celtic languages has been applied to the whole of them. The Celtic idioms belong to the Indo-German (Aryan) family, as their numerals show. Compare

Old Irish.	Old Welsh.	Sanscrit.
1. óin	un	êka
2. dá	dou	dvâu
3. trí	tri	trayas
4. cethir (c=k)	pedwar	chatváras
5. cóic	pimp	panchan
6. se	chwech.	shash
7. secht(n)	seith	saptan
8. oct(n)	wyth	ashtan
9. noi(n)	nau	navan
10. deich	dec	daçan
20. fichet	ugeint	vinçati
100. cét	cant	çata

The Gaulish was nearer to the Cymric branch, its numerals 4 and 5 having been *petor*, *pempe*. There are a few Gaulish inscriptions which show a declension with full inflections; in old Irish, five cases still exist, but the terminations are very much mutilated; in Welsh, they have disappeared. Thus, the Gaulish name *Segomarus* is declined: gen. *-ri*, dat. *-ru*, acc. *-ron*; the old Irish, *fer*, a man, has the gen. *fir*, dat. *fiur*, acc. *fer*, voc. *fir*; whilst the correspondent Welsh *gwr* is inflexible. Hence it follows that the pseudo-simplicity of the Welsh is the result of grammatical decay, common in all Aryan languages, and does not at all warrant Latham's theory, that the Celts branched off from the primitive Indo-German nation before the development of case inflections.

History.—Of the separation of the Celts from the other Aryans or Indo-Germans, and

their early migrations to western Europe, no record has come down, the stories about Milesian colonies in Ireland, and migrations from Troy into Wales, being simply monkish fictions. At the dawn of history, we find the *Gauls* (*Galli*, *Celtæ*, *Galatæi*) occupying France (*Gallia*), which was divided into *Aquitania*, between the Pyrenees and Garonne; *Gallia Celtica* proper, between Garonne and Seine; and *Belgica*, from the Seine to the Rhine. The land about the *Rhone* being more early conquered by the Romans than the rest, was set apart by them under the name of *Gallia Narbonensis*, or *Gallia Lugdunensis* (from the towns Narbo and Lugdunum, Narbonne and Lyon). The whole of the four was called Gaul beyond the Alps (*Gallia Transalpina*). A great many tribes of Gauls had settled in Lombardy, where they founded *Mediolanum* (Milan), and which therefore took the name *Gallia Cisalpina* (Gaul this side the Alps). Other Gauls had penetrated into Spain, where they became mixed with the native Iberians, and thus gave rise to the *Celtiberians* about the river Iberus (Ebro). Numerous hosts migrated across the Rhine, occupied southern Germany and Bohemia, and, following the course of the Danube, some invaded Thrace and Greece (278 B.C.); but being repelled, the main body of them settled in Asia Minor, in the province called after them *Galatia*. The Romans found the Gauls at first very formidable enemies; Rome itself was burned by them (389 B.C.), but gradually the Romans conquered first *Gallia Cisalpina* (222), then *Gallia Narbonensis* (112), and lastly, Cæsar subjected all France (52 B.C.), after which the Gauls soon became Romanized. The Gauls of Asia Minor, for a long time the terror of all the neighborhood, were defeated by the Romans (187), and their land finally made a province of the empire (25 B.C.).—The *Britons* (*Britanni*; Welsh, *Brython*) were little known before Cæsar's two unsuccessful expeditions into Britannia; the country was conquered by the Roman gen. Agricola (78–84 A.D.), who secured the new province against the inroads of the Caledonians of Scotland by a fortification across the Scotch lowlands, between the Forth and the Clyde, afterwards removed by the emperor Hadrian further southward, to between Solway firth and the mouth of the Tyne. The Britons were so much influenced by Roman civilization—they were also early converted to Christianity—that the heathen Angles and Saxons, who conquered them in the 5th and 6th centuries, called them *Welsk*, a name which, with the other Teutons, applies to all nations speaking languages of Latin descent. A few of the Britons maintained their independence in Cornwall, Cumberland, and in the mountains of *Wales*. On the last, the name Welsh was ultimately fixed by the English; they themselves, however, called their nation *Cymro*, pl. *Cymry* (a compound of *cyn*, with, in common, and *bro*, land = having a common country, countrymen, in contradistinction to the foreign invader), a name which has nothing to do with Cimbri and Cimmerii. The Welsh remained independent under different petty princes till 1282, when Edward I. conquered them. A part of the Britons went over in the 4th c. to France, where they took possession of *Brittany*, which maintained a doubtful independence under dukes of its own till about 1500.—Whether the *Caledonians*, the oldest inhabitants of Scotland, were Celts of the Cymric or Erse branch, is unknown. After the 3d c., their name disappears, and we hear, instead, of the *Scoti* and *Picti*. As to the latter, the same doubt prevails; but the *Scoti* were emigrants from Ireland, both *Scotus* and *Gadhelus* being common national names of the old Irish. From *Gadhel*, the modern *Gael*, *Gaelic* is derived, which has nothing to do with the name of the Galli.—*Ireland* (*Hibernia*, whence the modern *Eirinn* is derived), enters into the light of history with its conversion to Christianity by St. Patrick (460). The four centuries following on this event are the brightest period in its history. Ireland was then the seat of piety and learning, and sent forth numerous missionaries, by whom many monasteries, centers of civilization, were founded—as *Iona*, in Scotland, by Columba (563); *St. Gall*, by Gallus (615); *Würeburg*, by Kilian (687). In the 7th c., we find Irish bishops at Ratisbon; and *Virgilius* (Feargal), (died 784), bishop of Salzburg, played no small part in the ecclesiastical history of Germany. But Ireland remained politically divided among many princes, and so became an easy prey of those “black heathens” the Scandinavians, whose invasions began 795, and who founded Norse kingdoms at Dublin, Waterford, Limerick, etc. In the fierce battles between the two nations, the prosperity of Ireland rapidly declined, and the English conquest (1171) only completed the ruin.—The *Isle of Man*, inhabited by a branch of the Irish, after having been subject to Welsh, Scotch, Norse princes in turn, acknowledged England's sovereignty in 1344.

Religion and Mythology.—A few notices in the classics and the Latin inscriptions of Gaul are our rather meager sources of information on the Celtic paganism. As the three chief gods, or three of the chief gods, Lucan mentions *Teutates*, *Hesus*, and *Taranis*, all of them worshiped with human sacrifices. *Taranis* reappears as *Jupiter Iaranuennus* on an inscription; and from this identification with Jupiter, as well as from the fact that in Welsh *taran* means thunder, we may infer that he was the god of the thunderstorm. Other gods frequently occurring on inscriptions are *Apollo Grannus*, *Apollo Belenus*, *Mars Camulus*, *Minerva Belisama*, etc., all of them, however, empty names to us. A remarkable feature in Gaulish religion was the worship of certain *Mother Goddesses* (called on the inscriptions *Junones*, *Matronæ*, *Dææ Matres*, *Campestres*, *Nymphæ*). They are frequently connected with special localities, as in the inscriptions dedicated to *Matronis Lanehabius*, *M. Hamavehis*, *M. Rumanehabius*, and on the one in Gaulish: *Matrebo Namuricicabo*, “to the Mothers of Nîmes.” To this class apparently belongs the *Dea*

Nehalennia, once represented on a relief with a basket of fruit, and a dog for companion. Mela, the geographer, speaks of an island in the Atlantic, near Gaul, where there was an oracle superintended by nine maidens, who could cause storms, take the form of any animal, could cure what otherwise was incurable, and predicted the future. These goddesses, at once motherly and maidenly, residing in field and wood (campestres, nymphæ), givers of plenty and prophets of the future, are the heathen prototypes of the *fées* (fairies), as distinguished from "eifs" of the middle ages. The "little folk" were known to the Gauls under the name of *Dusii*. They believed in the existence of individual tutelary genii, as a stone of Lausanne shows, being erected by three Gauls *Sulfis suis* (hence our sylph?). The belief in the transmigration of souls was common amongst the Gauls, or at least their priests the *Druids*, so called from their performing sacred rites in oak-woods (Welsh, *derw*, an oak; *derwydd*, a Druid). These Druids were also the depositaries of knowledge and tradition, and constituted, in Gaul at least, a powerful hierarchy, with a supreme pontiff. Druids are found both in Ireland and in Wales, and the *fées* abound in Welsh tradition; but it is very doubtful whether the superhuman beings appearing in the Welsh poems of the 12th and 13th centuries—such as *Hu Gadarn*, the reputed founder of Bardic institutions (see beneath)—are genuine relics of the British religion. The belief in transmigration lasted very long, as the mediæval Welsh tale of *Talesin* speaks distinctly of *Talesin*'s successive existences. Though not properly mythological, we may mention here the romantic stories of the Britons about king *Arthur* and his knights. He is first mentioned by Nennius in the 9th c.; but his fable was further developed in the next centuries both in Wales and Brittany, then embodied in Geoffrey of Monmouth's *Historia Britonum*, which served as the groundwork of the French *Roman de Brut* of Wace. Through these works, and partly, also, through the direct influence of the oral traditions of Brittany, it passed into French literature, and thence spread over all Europe.

Literature.—The Gauls learned writing from the Greeks; later, they employed the Roman alphabet, as do the Welsh and Irish, the now used Irish character being nothing but the common Anglo-Saxon form of the Latin alphabet. Besides, however, the Irish claim an old character of their own, the Ogham, in which the letters are represented by a number of vertical strokes put in a right angle to a horizontal line, or else by horizontal strokes to a vertical line. Some of the Ogham inscriptions are said to be older than Christianity. Even more doubtful is the antiquity of a Welsh so-called Bardic alphabet, in which there seem to be no inscriptions extant, and which is, at any rate, an alteration of the Roman character. A feature common to all Celts is the existence of a kind of literary order, the *Bards* (q.v.), poets and guardians of tradition—in Gaul, nearly related to or part of the priesthood; in Wales and Ireland, in immediate connection with the kings.—A *Gaulish* literature there certainly was, as Cæsar informs us that, in the schools of the Druids, the young men used to learn by heart a great number of verses on theological and historical subjects. But these poems were never written down. It is highly probable that rhyme, first used by St. Ambrosius (397) in his hymns, is of Gaulish origin, this being the common form even of the oldest Irish and Welsh poems.—The *Irish* literature began with the conversion, but our existing manuscripts are not older than the 9th or 8th century. Interlinear versions of biblical and other theological, or of grammatical writings are about the oldest manuscripts, many of which, in consequence of the missionary zeal of the nation, are to be found at St. Gall, Milan, and other continental places. Then there are ecclesiastic *hymns*, one of the oldest ascribed to Patrick. A renowned author of poems, in the 10th c., was Eochad O'Flin. Secular poetry of ancient times there has come down to us none, but we have testimonies as old as the 12th c. of the existence of such, ascribed in a general way to the old pagan hero Oisín, son of Mac-Cumhal. The existing specimens, mostly warlike—except some dialogues between Oisín and St. Patrick—are recent. Those Gaels that went over to Scotland, took, of course, similar traditions with them. With a partial knowledge of these, Macpherson composed (1765) the work which he declared (rather loosely) to be an English translation of the songs of the old Scotch poet Ossian, son of Fingal (the true Oisín was an Irishman). The would-be Gaelic original of Macpherson's work, edited in 1807, is either a compilation or retranslation. Of Irish prose, the annals are the most important part: first, those of Tighernach (1088), then the *Annales Inisfalienses*, *A. Ultonienses*; lastly, the *Annals of the Four Masters*, being a compilation made (1634) from older sources chiefly by four Franciscans, beginning with 242 after the deluge, and ending with 1616 A.D.—The oldest remains of *Welsh* literature are the songs, so far as they are genuine, of the bards of the 6th c.—*Llewarch Hen*, *Aneurin*, *Talesin*—having chiefly the life and deeds of contemporary princes for their subject, but few in number. In the 10th c., we have the collection of laws by Howel Dda. The historians Gildas and Nennius, of the 9th c., wrote in Latin.

The great age of *Welsh* literature is the 12th and succeeding centuries, when the energies of the nation were roused in the struggle with England. In this contest, the bards played a conspicuous part as agitators. After a long interval, we hear again of a great bard, Meylir (1100); many follow, amongst whom Kynddelw (1200) deserves special mention, both as a poet (we have 49 pieces of his) and a patriot. Welsh poetry consists in—1. Political lyrics, war-songs, songs in praise of chieftains, elegies on the same. 2. Religious hymns. 3. Pseudonymous poems, ascribed to Merddin (Merlin), the

mythical enchanter, and Taliesen, the old bard, having generally the form of prophecies on the struggle between the Saxons and Welsh, and the ultimate triumph of the latter. Thus, in the *Avallennau* (or apple trees), attributed to Merlin, the Welsh nation is enigmatically represented under the image of "seven score and seven sweet apple trees," whose fruits, princes (viz., the English) wish in vain to despoil. 4. The Triads, short memorial (?) verses in which three remarkable events, subjects, or persons are respectively mentioned (hence the name), embracing history, theology, jurisprudence. 5. Dialogues of dramatic character. There were—apparently now lost—also miracle plays actually represented.

The only remarkable remnant of *Cornish literature* comes under this head, being three ecclesiastical plays of the 14th c.—the *Creation*, the *Passion*, and the *Resurrection*.—In Welsh prose, we have first the chronicles. Geoffrey's chronicle, though Latin, is thoroughly national; then there is that of Caradoc, who begins where Geoffrey leaves off; and the *Liber Landavensis*, a history of the bishops of Llandaff down to 1132. Further, we have the *Mabinogion* (Children's Tales), romantic stories. The most interesting of these refer to Arthur and his champions; the lady of the fountain, Peredur, Geraint (now revived by Tennyson), Arthur's boar-hunt. Amongst the non-Arthurian tales, special mention is deserved by the *Mabinogi of Taliesin*, interspersed with verses, relating the adventures, transformations into animal shape, and transmigrations of that bard. There are besides some scientific writings, a treatise on medicine, another on geometry, and one on Welsh prosody by Edeyrn (1260). This last, a grammatical essay in and on a vernacular tongue, is paralleled in the middle ages only by Icelandic literature, to which, upon the whole, the Welsh, although not quite so high, bears a marked resemblance.

Concluding Remarks.—Altogether, the Celts are a very important branch of our Indo-German family. The incessant warfares of the Gauls bespeak at least activity of mind and body; the Irish missions have done a great deal for European civilization; whilst the traditions of the Britons have deeply influenced mediæval literature. The one great defect of the Celts is incapacity for political organization. Their very enthusiasm, lively feeling, and vivid imagination, have ever prevented them from taking coolly and deliberately those measures which lead to national unity; hence it is that they gave way before the more practical Roman and Teuton. But while they lost their independence, and oftentimes their very language, in the contest with the foreigner, whose strong hand molded them into national unity, yet they reacted on him in their turn. They are fast disappearing by merging into the English; but if the quiet resolution, the sturdy common sense, the talent for public life, state organization, and political dominion, that characterize the modern British nation, are altogether Teutonic—on the other hand, their genuine refinement of manner and feeling, and their high poetical susceptibilities, are to no small extent due to the admixture of Celtic blood.

CELTIS. See NETTLE-TREE.

CEMBAL D'AMORE, an instrument belonging to the clavichord family. Its form was that of an English spinet. The strings were twice as long as those of the ordinary clavichord, and when touched the keys struck the central node of the string, both halves of which vibrated simultaneously. There were two bridges instead of one, as in the clavichord, and two sound-boards of unequal forms and dimensions. The cembal d'amore stands between the clavichord and the pianoforte. The Rev. J. C. Cotter, of Cork, endeavored to obtain the effect of the cembal d'amore on a pianoforte, which he had made by Messrs. Broadwood about 1865. In this instrument, which he termed the lyrachord, the clarinet quality was prominent.

CEMBRA NUT AND CEMBRA PINE. See PINE.

CEMENTATION OF STEEL is the process followed in the production of *blistered steel* (q.v.), or *steel of cementation*.

CEMENTS. A cement is a substance used to make the surfaces of solid bodies adhere to one another; it is applied in a liquid or viscous state, and hardens after the surfaces are brought together. When fused metals or alloys are used in this manner, they are called solders. There is a great variety of C. derived from animal, vegetable, and mineral substances. Animal C. are chiefly composed of gelatine and albumen as their bases. Joiners' glue (q.v. under GELATINE) is an example. The binding materials of vegetable C. are gums, resins, and wax. The mineral C. are chiefly of lime and its compounds. In many C., animal, vegetable, and mineral substances are combined. The simplest of the mineral C. is plaster of Paris, which is used for uniting slabs of marble, alabaster, and many similar purposes. It is mixed with water to the consistence of thick cream, and then applied. This hardens rapidly, but is not very strong. Its hardening depends upon the true chemical combination of the water with anhydrous sulphate of lime, of which plaster of Paris is composed, and the formation thereby of a solid hydrate. The plaster of Paris may be mixed with thin glue, with diluted white of egg, or a solution of size or gum, instead of water, and is strengthened thereby.

Keene's marble cement is prepared by steeping plaster of Paris in a concentrated solution of alum, then recalcining and powdering. This powder is mixed with water in the same manner as plaster of Paris. It is used as a stucco for internal decorations,

takes a high polish, and when colored, forms beautiful imitations of mosaic, marbles, scagliola, etc.

A mixture of paper pulp, size, and plaster of Paris in equal proportions, forms a useful cement, and is also used as a sort of papier-mâché for casting into architectural ornaments, etc.

Common mortar is one of the most important of the lime cements. It is composed of slaked lime, or a mixture of this with sand; its hardening depends upon the slow formation of carbonate of lime by the absorption of carbonic acid from the atmosphere, and a partial combination with the silica of the sand. Cow-hair is sometimes mixed with it, to bind it when laid in masses. In order to obtain a fine smooth paste, which is required for good mortar, the lime should be slaked rapidly by adding about three parts of water to one of lime; if the quantity of water is too small, a coarser or semi-crystalline hydrate of lime is produced by the slaking. For the mode of applying mortar, see BRICKWORK.

Hydraulic cement, or cement that can "set" and harden under water, is produced in great quantities in the United States. It was first discovered at Chittenango, N. Y., in 1818, by Canvas White, who received \$20,000 from the state for the information. The largest manufactory of this cement is now at Kingston, N. Y. The production of hydraulic cement in the U. S. for 1894 was 7,813,776 barrels of 300 lbs., of a value of \$4,455,928, and in 1895 the production was 7,694,053 barrels.

Pozzuolana, a porous lava found at Pozzuoli, near Naples, has been long celebrated for its property of forming a hydraulic cement, when mixed with ordinary lime. It is mainly composed of silicates of alumina, lime and soda. Portland cement, so named from its resemblance to Portland stone when dry, is made from clay which is intimately mixed with chalk, and then burned. Roman cement is similar to the Portland, but of a darker color; it contains a larger proportion of clay, and solidifies more rapidly. These C. should be mixed with water to form a moderately thick paste; the surfaces to which they are applied should be well wetted, and the cement kept slightly moist until it hardens. The solidification of hydraulic C. depends upon the combination of the lime with the silica and alumina forming first a hydrated compound, and finally a true silicate. The production of Portland cement in the U. S. in 1894 was 611,229 barrels of 400 lbs. of a value of \$1,209,446, and in 1895 the production was 749,059 barrels.

Cement composed of ox-blood thickened with finely powdered quicklime, is used by copper-smiths, for securing the edges of rivets of copper boilers, and for steam-joints. Another cement for steam-joints is made with borings or turnings of cast-iron mixed with a little sal ammoniac and flowers of sulphur. It should be stirred up with a small quantity of water, just sufficient to moisten it, then rammed into the joint, which should be bolted up as tightly as possible: 5 lbs. of iron borings to 2 oz. of sal ammoniac, and 1 oz. of sulphur, are the proportions recommended. A cement of this kind may be made of 4 lbs. iron borings, 2 lbs. pipe-clay, and 1 lb. of powdered earthenware fragments made into a paste with salt and water; or 2 parts litharge in fine powder, 1 part very fine sand, and 1 of quicklime that has slaked spontaneously in a damp place. These should be mixed, and kept from the air, and made into a paste with boiled linseed oil when about to be used. This is a valuable cement for steam-joints, for mending cracks in boilers, ovens, etc. Beale's patent fireproof cement, for similar purposes, is composed of chalk, 12 parts; lime and salt, each 4 parts; Barnsey sand, 2 parts; iron filings or dust, 1 part; and blue or red clay, 1 part. These are ground and calcined together.

Electrical Cement—so called from its use in uniting the cylinders of electrical machines to their axes, and for a variety of similar purposes—is composed of 5 lbs. rosin, 1 lb. each of bees'-wax and red ochre, and 4 oz. of plaster of Paris. This is Singer's formula. A cheaper cement of this kind may be made from 14 parts rosin, 2 red ochre, and 1 plaster of Paris. These should be melted together till the frothing ceases, and the composition runs smoothly. This is applicable to a variety of purposes, where a cheap and tolerably adhesive cement is required. It will serve as bottle-wax for sealing the tops of corks; but this is usually prepared from 4 parts rosin with one of tallow or suet, and red ochre or other coloring matter added.

For mending earthenware and china, etc., a variety of C. are recommended. For ornamental glass or china, which is not subjected to heat or rough usage, Canada balsam that has evaporated until rather hard, is a very useful cement; from its transparency, it makes an almost invisible joint. The surfaces should be slightly warmed, and the balsam brushed over them, after which they should be kept pressed together for a short time. Thick copal or mastic varnish may be used in the same manner. Gum shellac, dissolved in spirits of wine in sufficient quantity to form a treacly liquid, forms a stronger cement than the above, but its color is objectionable for some purposes. The shellac may be dissolved in naphtha, but is not equal to that in spirits of wine. The *liquid glue* sold in the shops is usually prepared in this manner; another kind is made of a mixture of the solutions of shellac and India rubber. The cement sold in sticks at fairs and in the streets of London by loquacious itinerants, is shellac or gum mastic fused and molded into a convenient form, and is one of the most useful C. when properly applied, by heating the surfaces to be joined, just sufficiently to fuse the shellac and then smearing them thinly with it, and pressing them together. If shellac is heated much above its fusing-point, it becomes carbonized and rotten, and therefore great care

must be used in fusing any composition of which it is an ingredient. The *marine glue*, a mixture of shellac and India rubber, is a remarkable cement, and when applied, as the last, with the precautions just alluded to, is so strong, that glass or china cemented with it, and then dashed on the ground, or otherwise broken again, will give way in any part rather than that cemented. This cement may be purchased ready made. For the mode of preparing it, see *GLUE*.

Universal Cement, used for the above and many other purposes, is prepared as follows: Curdle skim-milk with rennet or vinegar, press out the whey, and dry the curd at a very gentle heat, but as quickly as possible. When it has become quite dry, grind it in a coffee or pepper mill, and next triturate it in a mortar until reduced to a very fine powder. Mix this powder with $\frac{1}{10}$ th of its weight of new dry quicklime, also in very fine powder, and to every ounce of the mixture add 5 or 6 grains of powdered camphor; triturate the whole well together, and keep it in small wide-mouthed phials well corked. When required, make it into a paste with a little water, and apply it immediately.

Cheese Cement is similar in composition and uses. Take two parts of grated cheese and one of quicklime in fine powder; beat these together with white of egg to form a paste, and use immediately.

The following is the reputed formula for preparing the *Armenian or diamond cement*, used by the Armenian jewelers for attaching diamonds, etc., without any metallic setting: "Dissolve 5 or 6 bits of gum-mastic, each the size of a large pea, in as much rectified spirit of wine as will suffice to render it liquid; and in another vessel dissolve as much isinglass, previously a little softened in water—though none of the water must be used—in French brandy, or good rum, as will make a 2-ounce phial of very strong glue, adding two very small bits of gum galbanum or ammoniacum, which must be rubbed or ground till they are dissolved. Then mix the whole with a sufficient heat. Keep the glue in a phial closely stopped, and when it is to be used, set the phial in boiling water." This cement has a great reputation, but our experience does not confirm it. We have tried the above, and several other receipts, with very little success. We doubt whether the true method of preparing it is known in this country, and suspect that it still remains one of the oriental trade-secrets. White of egg, thickened with finely powdered quicklime, forms a useful cement, especially if the cemented article is warmed for a short time in a slow oven.

Cutlery Cement, used for fixing knives and forks in handles, is made of equal weights of rosin and brick-dust melted together; or, for a superior quality, 4 parts of rosin, 1 of bees-wax, and 1 of brick-dust.

Mahogany Cement, used for stopping cracks and holes in mahogany, may be prepared by melting 4 parts of bees-wax with 1 of Indian red, and as much yellow ochre as is found requisite to give the color. If shellac be substituted for the bees-wax, and less red used, a much harder cement is made.

For lime cement for joining paper articles and artificial flowers, see *GELATINE*; *PASTE*.

CEMETERY, from the Greek, may mean any grave-yard, or other place of deposit for the dead; but it has lately acquired a special meaning, applicable to those extensive ornamental burial-grounds which have recently come into use in this and other European countries, as the practice of burying within and around churches was gradually abandoned (see *BURIAL*). The fine burial-grounds of the Turks, extending over large tracts adorned by cedars and other trees, may have suggested the plan to Europeans. It was first exemplified on a great scale in Paris, in which, as the largest walled town in Europe, the disposal of the dead was long a matter of extreme anxiety and difficulty. There are few considerable towns in Britain near which there is not at least one C., and the legislation mentioned under the head of *BURIAL* has rendered their establishment, to a certain extent, a legal necessity. There was at first a natural feeling of regret at the prospect of deserting places of deposit for the dead so hallowed by ancient use and recent associations as the church and the churchyard. In many instances, however, the places thus professedly hallowed were in reality surrounded by degrading and disgusting circumstances. On the other hand, the new places of interment began to develop humanizing and elevating influences, in beautiful trees and flowers, natural scenery, and works of monumental art. The new cemeteries are in many instances cheerful open places of recreation, and in them the place of rest for the dead has rather tended to improve than to undermine the health of the living. One of the oldest established European cemeteries is that of Père la Chaise, near Paris (see *LACHAISE*), the arrangements of which have been generally followed in the cemeteries of London and other English cities; with, however, this distinct difference, that the English cemeteries are divided into two portions—one consecrated for the burials of members of the established church, over whose remains the funeral service is read, and one unconsecrated for the burials of dissenters. In the Scottish such distinctions are not required, though the Episcopal church has some consecrated burying-places. In the United States, as at Philadelphia and New York, there are cemeteries equal in point of arrangement to any in Europe. The famous Père la Chaise is the most celebrated of modern cemeteries, although by no means the largest. It was laid out in 1804, and com-

prises about 200 acres, and more than 16,000 monuments erected to the memory of nearly all the great men of France of the present century. Twice this C. and the neighboring heights have been the scene of desperate fighting. In 1814, during the attack on Paris by the allies, it was stormed by a Russian column; and in 1871 the communists made their last stand among these tombs, where 900 of them were killed, 200 being buried in quicklime in one huge grave, and 700 in another. Paris has also the cemeteries of Mont Parnasse and Montmartre, besides many smaller burial-grounds. In 1874, a very large C. was laid out 16 m. n. of Paris, covering nearly 1300 acres. In France, every city and town is required by law to provide a burial-ground beyond its barriers, properly laid out and planted, and each interment must take place in a separate grave. This law does not apply to Paris, however. There the dead are buried 40 or 50 at a time in the *fosses communes*, the poor being interred gratuitously, and a charge of 20 francs being made in all other cases. The *fosse* when full is left undisturbed for 5 years; then all the crosses and other memorials are removed, the level of the ground is raised 4 or 5 ft. by fresh earth, and interments begin again. For 50 francs a grave can be leased for 10 years; but when permanent monuments are desired the ground must be purchased in fee.

In English cities, about 1840, the people began to discuss the dangers to public health arising from the condition of the grave-yards surrounding, and the vaults within and underneath, the great churches. In London, these receptacles were literally crammed with coffins, and the surrounding air was infected to a dangerous degree. Coffins were piled upon each other until they came within a few inches of the surface of the ground, and then the ground was raised from time to time until its level came nearly up to the lower windows of the church. To make room for new burials, old bones were thrown out, and this led to systematic robbing of graves for the sake of the coffin plates and the pretty ornaments sometimes buried with the bodies. The result of this action and discussion was an entire change in the system. Burials within the limits of cities and villages were prohibited, and as a necessity rural cemeteries were founded. The chief cemeteries of London at present are: Kensal Green, on the Harrow road, 2½ m. from Paddington; Highgate, on a slope of Highgate hill; Abney Park; the Norwood and Nunhead cemeteries, on the s.; the west London C., at Brompton; Ilford and Leystone cemeteries in Essex; the Victoria and Tower Hamlets cemeteries in e. London; while further from the city were the cemeteries of Woking and Colney Hatch.

The dead-houses (*Leichenhauser*) of Frankfort and Munich form a remarkable feature of the burial customs of those cities. The objects of the founders were to obviate the remotest danger of premature interment, and to provide a respectable place for the reception of the dead, in order to remove the bodies from the often confined dwellings of the friends. At Frankfort, the dead-house is at the entrance to the cemetery. It consists of a warder's room, where an attendant is always on duty; on each side are five rooms, well ventilated, and kept at even temperature, and each one is furnished with a bier, on which a corpse can be laid. On one of the fingers of a corpse is placed a ring, to which is attached a light cord, connecting with a bell which hangs outside of the attendant's room. Bodies deposited here are inspected at regular intervals by a medical officer, and the warden is always on the watch for the ringing of the bell. The importance of this care was once proved at Frankfort by the revival of a child. The attendants are required to receive and treat the dead with all respect, and no interment is permitted until signs of decomposition appear. The relations are then notified, and a funeral is held. Similar mortuaries have been established in many English towns.

Of the cemeteries still in use in southern Europe, the catacombs of Sicily are the most remarkable. In one of these, near Palermo, under an old Capuchin monastery, there are four subterranean corridors, in which more than 2,000 corpses are ranged in niches in the wall, many of them shrunk into the most grotesque attitudes, or hanging with pendent heads or limbs from their receptacles. As a preparation for its niche, the body is desiccated in an oven, and then dressed as if in life and put in its place in the wall. At one end of this C. there is an altar, strangely ornamented with a mosaic of human skulls and bones.

Campo Santo (holy field) is now the Italian designation for a cemetery or burying-ground, but more especially for an inclosed place of interment, surrounded internally by an arcade, and destined to receive the remains of persons of distinction. The most famous C. S., and that from which the others derived the name, is that of Pisa—in the neighborhood of the Dome, and consecrated to the memory of men who had deserved well of the republic. It was founded by Archbishop Ubaldo, towards the end of the 12th century. The archbishop, having been driven out of Palestine by Saladin, brought his fifty-three vessels, which had been destined for the conquest, laden with the earth of the Holy Land. This he deposited on the spot which was thence called the holy field, and which, as we have said, gave its name as a generic term to the burying-grounds of Italy. The architect of the existing building was Giovanni Pisano, under whose superintendence it was completed in 1288. It contains an area of 400 ft. in length, and 118 in breadth; and is surrounded by a lofty wall, on the inner side of which a wide arcade runs round the whole inclosure, giving to it the character of one magnificent cloister. At the smaller eastern side, there is a large chapel, and two smaller chapels of smaller size on the northern side. The lofty circular arches of the arcade are filled with the

richest Gothic tracery, which belongs, however, to a later date—the latter half of the 15th c.—and consequently formed no part of the original design. The walls are adorned with frescoes which are of great interest and value, both absolutely and with reference to the history of art. The oldest of those which have been preserved adorn one side of the eastern wall; they represent the passion of Christ, his resurrection, and other sacred subjects. These remarkable paintings are supposed to date before the middle of the 14th c., and are ascribed to Buffalmacco. But the most marvelous productions are those of Giotto (q. v.), of Simone Memmi, and of Andrea and Bernardo Orcagna.

Among nations in the east cemeteries have been in use from the earliest times. In China the high grounds near Macao and Canton are crowded with tombs, many of them in the form of small tumuli with a low encircling wall, like the ringed barrows of western Europe. But the most picturesque of all cemeteries are those of the Turks. From them it was, perhaps, that the first idea of the modern C., with its ornamental plantations, was derived. Around Constantinople the cemeteries form vast tracts of cypress woods, under whose branches stand thousands of tombstones. A grave is never reopened; a new resting-place is given to every one, and so the dead now occupy a wider territory than that which is covered by the homes of the living. The Turks believe that until the body is buried the soul is in a state of discomfort, and the funeral, therefore, takes place as soon as possible after death. No coffin is used; the body is laid in the grave, a few boards are placed around it, and then the earth is shoveled in, care being taken to leave a small opening extending from the head of the corpse to the surface of the ground, an opening not unfrequently enlarged by dogs and other beasts which plunder the graves. A tombstone of white marble is then erected, surmounted by a carved turban, in case of a man, and ornamented by a palm branch in low relief, if the grave be that of a woman. The turban by its varying form indicates not only the rank of the sleeper below, but also the period of his death, for the fashion of the Turkish head-dress is always changing. A cypress is usually planted beside the grave, its odor being supposed to neutralize any noxious exhalations from the ground, and thus, every C. is a forest, where by day hundreds of turtle-doves are on the wing or perching on the trees, and where bats and owls swarm undisturbed at night. These cemeteries are a favorite resort for Turkish women, some of whom are always to be seen praying beside the narrow openings that lead down into a parent's, a husband's, or a brother's grave. The cemeteries of the Armenians abound in bas-reliefs, which show the manner of the death of the person beneath, and on these singular tombstones are frequent representations of men being decapitated or hanging on a gibbet.

America closely followed England in the sanitary reform of burial-places, and many years ago burial within certain limits of cities was prohibited except in special cases, such as the use of private vaults in church-yards. The earliest of the great cemeteries in the United States was Mount Auburn, near Boston, covering 125 acres, lovely by nature, and most elaborately adorned.

Laurel Hill C., in Philadelphia, was opened in 1836. It is on the Schuylkill River, about 4 m. n. of the center of the city, and is part of a region of romantic beauty, abounding in gentle declivities, picturesque lawns, rugged ascents, rocky ravines, and flowery dells. A carriage drive, along the river front, connects Fairmount Park and the Wissahickon; thus bringing the ever-varying activity of the living into association with the tranquil resting-places of the dead. Since the first purchase of ground, several larger tracts have been added to it; while, under the management of various associations, other portions of the beautiful vicinity have been, in a similar manner, consecrated and adorned. This was followed by Greenwood C., the first and one of the greatest popular burial-places for New York and Brooklyn. The company was chartered in 1838. The grounds, which comprise 474 acres, occupy the hills and valleys on the e. side of the bay of New York, about 3 m. s. of the city hall in Brooklyn. The situation is one of the finest in all the region. From the higher points of the C. the eye takes in the two cities of New York and Brooklyn, the bay, half a dozen cities in New Jersey, the far-off Palisades, the broad lower bay, the Highlands near Sandy Hook, Coney Island, the rich garden lands of King's county, and a grand view of the Atlantic ocean. This C. has five entrances; nearly 20 m. of stone-bedded avenues, and 17 m. of concrete paths. Water for drinking and irrigation is supplied from the city works to nearly 40 hydrants. There are eight lakes of varying dimensions, and four ornamental fountains. The first interment was on the 5th of Sept., 1840, and the average annual number of bodies interred is from 5000 to 6000. Lake View Cemetery, at Cleveland, Ohio, is one of the many celebrated places of interment in the interior states, and contains the Garfield mausoleum. Spring-Grove Cemetery, at Cincinnati, contains 600 acres, and has been laid out at great expense. Minneapolis, also, has a very beautiful cemetery.

CENCI, BEATRICE, b. 1577, called "the beautiful parricide," was the daughter of Francesco Cenci, a wealthy Roman nobleman. According to Muratori (*Annates*, lib. x.), Francesco was twice married, Beatrice being his daughter by the first wife. After his second marriage he treated the children of his first wife in a revolting manner, and was even accused of hiring bandits to murder two of his sons on their return from Spain. The beauty of Beatrice inspired him with the horrible and incestuous desire to possess her person; with mingled lust and hate, he persecuted her from day to day, until circum-

stances enabled him to consummate his brutality. The unfortunate girl besought the help of her relatives, and of pope Clement VII. (Aldobrandini), but did not receive it; whereupon, in company with her step-mother, and her brother, Giacomo, she planned and executed the murder of her unnatural parent. The crime was discovered, and both she and Giacomo were put to the torture; Giacomo confessed, but Beatrice persisted in the declaration that she was innocent. All, however, were condemned, and put to death, August, 1599, in spite of efforts made in their behalf. Such is Muratori's narrative. Others allege that Beatrice was the innocent victim of an infernal plot. The results of Bertolotti's investigations (*Francesco Cenci e la sua Famiglia*, 1877), based on original documents and contemporary notices, go far to deprive the story of the Cenci tragedy of the romantic elements on which Shelley's powerful tragedy mainly turns. Francesco, it would appear, was profligate, but no monster; Beatrice at the time she murdered her father, was not 16 but 21 years of age, was far from beautiful, and probably had already a tarnished moral reputation. And Bertolotti is further convinced that the sweet and mournful countenance which forms one of the treasures of the Barberini palace in Rome, is not only not the portrait of Beatrice, but was not even painted by Guido, to whom it has long been unhesitatingly attributed.

CENEDA, now officially called VITTORIO, a city of northern Italy, province of Treviso, 36 m. n. of Venice. Pop. 11,000. It is an episcopal see, has a very handsome modern cathedral and a fine monolithic fountain. Under the republic of Venice it was rich, and famed for its manufactures of woolen cloth, silk, and paper. C. is very ancient, dating from the time of the Romans, but now it is a decayed city.

CENIS, MONT, or MONTE CENISIO, a mountain-pass of the Alps, between Savoy and Piedmont, forming part of the water-shed between the valleys of the Doire and the Arc. The culminating point of the pass reaches an elevation of 6,775 ft. above the sea. Schist, limestone, and gypsum, in alternate beds, compose the strata of the mountain, the vegetation of which is rich in the rarer kinds of Alpine plants. Over the pass a road was constructed (1803-10) by the chevalier Fabbioni, under Napoleon's orders, at an expense of \$1,500,000. This is the safest, and most frequented road across the Alps.

CENIS, MONT, is a remarkable piece of railroad building completed in 1870. In 1865, an English engineer obtained permission from the Italian and French governments to lay a railway on the line of Napoleon's carriage road over the mountains. The road was built in the ordinary way with the addition of a third rail midway between the outer ones, and raised nearly a foot higher. This third rail was strongly gripped by the driving wheels, by which means the trains could safely traverse very sharp curves and descend grades as steep as 1 ft. in 12. On the French side the rise to the summit in 6½ m. of road was 4,460 feet. Then there was a stretch of 5 m. nearly level, and after that the descent to Susa on the Italian side, a distance of 20 m. over curves so numerous and so sharp that the view changed almost every minute, trains descended by the momentum of weight, the speed being regulated by brakes. This road was superseded by the one now in use, which runs through the great tunnel. (See TUNNEL.)

CEN'OBITES. See MONACHISM.

CENOMANIAN. (French.) The name given by the French to the Lower Chalk and Upper Greensand of English geologists.

CENO'MYCE. See REINDEER MOSS.

CENO'TAPH (Gr. *kenotafion*, from *kenos*, empty, and *taphos*, a tomb), a monument which does not contain the remains of the deceased. They were originally erected for those whose bones could not be found, e.g., for those who had perished at sea. Later, the name was applied to tombs built by a man during his lifetime, for himself and the members of his family.

CENSER (Fr. *encensoir*, from Lat. *incendo*, to burn), a vase, or other sacred vessel, used for burning perfumes. See INCENSE. Censers were much used in the Hebrew service of the temple, but their form is not accurately ascertained, and it is probable that they varied in this respect, according to the occasions on which they were used. The C., called also a *thurible* (Lat. *thuribulum*, from *thus*, frankincense), is used in the Roman Catholic church at mass, vespers and other offices. It is suspended by chains, which are held in the hand, and is tossed in the air, so as to throw the smoke of the incense in all directions. It varies very much in form.

CENSORI'NUS, a chronologist and grammarian of the 3d c., known by a work called *De Die Natali*, in which he treated of man's generations, his natal hour, and the influence that the stars and genii exercise over his fate. It was by some work of his on chronology that certain important dates have been ascertained.

CENSORS, the name of two Roman officers of state. The office was established by Servius Tullius, the fifth king of Rome. After the expulsion of the kings, it was held by the consuls, special magistrates not being appointed till 443 B.C. It continued to be filled by patricians till 351 B.C., when C. Marcus Rutilus, a plebeian, was elected. Twelve years later, it was enacted that one of the C. (there were always two) must be a plebeian. In 131 B.C., both C. for the first time were plebeians. The C. were

elected in the *comitia centuriata*, presided over by a consul. The term of office at first lasted five years, but was shortly afterwards limited to 18 months. The censorship was regarded as the highest dignity in the state, except the dictatorship. It was a sacred and irresponsible magistracy, whose powers were vast and undefined, and whose decisions were received with solemn reverence. The duties of the C. were threefold. 1. The taking of the census, or register of the citizens and of their property. 2. The *regimen morum* (regulation of morals). 3. The administration of the finances of the state. The taking of the census (Lat. *censeo*, to value, to take an account of) was originally their sole function (hence their name), and was held in the Campus Martius, in a building called *villa publica*. The *regimen morum* was the most dreaded and absolute of their powers. It grew naturally out of the exercise of the previous duty, which compelled them to exclude unworthy persons from the lists of citizens. Gradually, the superintendence of the C. extended from the public to the private life of citizens. They could inflict disgrace (*ignominia*) on any one whose conduct did not square with their notions of rectitude or duty. For instance, if a man neglected the cultivation of his fields, or carried on a disreputable trade, or refused to marry, or treated his family either too kindly or too harshly, or was extravagant, or guilty of bribery, cowardice, etc., he might be degraded, according to his rank, or otherwise punished. The administration of the finances of the state included the regulation of the *tributum*, or property-tax; of the *vectigalia*, such as the tithes paid for the public lands, salt-works, mines, customs, etc., which were usually leased out to speculators for five years; the preparation of the state budget, etc.—See Rovers, *De Censorum apud Romanos Auctoritate et Existimatione* (Utrecht, 1825).

CENSORSHIP OF THE PRESS, the term generally applied to the arrangements for regulating what may be printed, in countries where the press is not free. The simplest form of C. is when a public officer—the censor, or licenser, as he is sometimes called—reads over the MS. to be printed, and, after striking out any objectionable passages, certifies that the work may be printed. Thence it is common in old books to see the word *imprimatur*—let it be printed—followed by one or more signatures. Though it has its name from an analogy with the functions of the Roman censor, the C. did not come into operation until the invention of printing. It was common to all European countries, Great Britain included. The C. was established by act of parliament in 1662, 13 Char. II. c. 33: “An act for preventing the frequent abuses in printing seditious, treasonable, and unlicensed books and pamphlets, and for regulating of printing and printing-presses.” This was a temporary act, renewed from time to time; and its renewal was refused in 1693, owing to a quarrel between the house of commons and the licenser. Since that time there has been, generally speaking, no restriction in Gt. Britain on what any man may publish; and he is merely responsible to the law, if in his publication he should commit any public or private wrong. See **AMERICAN JOURNALISM**; **BOOK-TRADE**; **COPYRIGHT**; **LIBEL**; **NEWSPAPER**.

CENSUS means, in the U. S., the periodical counting of the people. It is a Latin word applied by the Romans to one of the functions of their censors (q.v.). They had to enumerate the people, but only for immediate purposes of taxation, so that no account of the results of such enumerations has been preserved. The numbering of the people, though on one special occasion forbidden by the highest power, is an ancient custom. Moses numbered the Israelites in the wilderness, and, in later times, Joshua and David followed his example. The Chinese tell of a C. of their people taken 2042 years before the birth of Christ. In Japan an enumeration was made about 1900 years ago. Solon ordered the C. of Athens to be taken, especially with reference to classes of the people and taxable property. Servius Tullius, sixth king of Rome, ordered a C., when every citizen had to appear on the field of Mars and declare on oath his name and residence, the number and names of his children, and the value of his property. Failing to do this, his property might be confiscated and himself scourged and sold for a slave. Augustus enlarged the scope and improved the manner of taking the census. In the 16th c. the church began to record births, marriages, and deaths, and from this practice gradually grew up the modern C., though there does not appear to have been any exact popular C. made until after the beginning of the 18th century.

Russia, then almost a barbarous country, appears to have led other nations in C. taking. Partial enumerations were made in 1700, 1704-05, and 1710. In 1719 Peter the Great sent a commission into all the provinces to make a general census. This commission took account of the number of peasants, mechanics, domestics, and men unemployed. Women were not taken into account at all at the commencement, but they were recognized before the work closed, and in some districts were partially enumerated. In 1722, the C. distinguished the insane and infirm without means of subsistence and the czar ordered that a C. should be taken every twentieth year. In 1802 a central bureau of statistics was organized; reorganized in 1852, and again in 1858. This bureau is charged with the taking of the C., which now includes much the same information as that obtained in the United States.

Prussian enumerations were begun under Frederick William I., and improved by his successor. From 1748 to 1800, the C. was taken annually, except when prevented by war. In 1805, the central bureau of statistics was established. In 1834, a triennial C. was ordered. The schedules for questioning were very full, and the enumeration was to be

made some one day in December. The first C. of the German Empire was taken on the 1st of Dec., 1871. Austria first took a C. in 1754, and kept it up triennially until 1857, when it was enacted that the enumeration should be made every sixth year. In Sweden, as early as 1686 there was a law requiring the clergy to record marriages, legitimate and illegitimate births, deaths, persons removed from or settled in parishes, and all the population, arranged by place of habitation and households. Such information was first published in 1746. A statistical bureau was established in 1857, to collate and publish C. and other statistical information. Norway has kept up a decennial C. since 1815, and the work is usually thoroughly done. In Spain, enumerations were made in 1787, 1798, 1857, 1860, 1867, and the last in 1887. The work is done by government officials in one night. Denmark had a C. once in five years, from 1840 to 1860; now it is decennial, the last enumeration being on the 1st of Feb., 1890. The first C. of Portugal was made Jan. 1, 1864. Since then enumerations were made in 1878 and in Nov., 1890. Switzerland began its enumerations about 1750. Her C. is now decennial. Belgium doubtless leads all nations in the fullness and accuracy of her statistics, although her C. is taken but once in ten years. The last was in 1896. The Netherlands C. is decennial. The last was taken Dec. 1, 1890. Italy has an enumeration once in ten years, the last Dec. 31, 1891. Greece counts up irregularly. From 1836 to 1845, a C. was made every year; then in 1848, 1853, 1856, 1861, 1868, and 1889. Turkey has never taken a C. except for conscription or taxation. The first C. on record in France was taken in 1700 and published in 1720. There was a general C. taken in 1800, and a decree of the national convention ordered that it should be continued every fifth year. Since about 1820, the C. has been taken very regularly. Brazil began in 1872, the Argentine Republic in 1869, Colombia in 1870, and Egypt in 1862. In Germany and England and Spain the entire enumeration is made in a single day, or night. The last census in Germany was taken in 1890; the last in Austria, in 1891; the last in Great Britain and her colonies in 1891; the last in France in 1896; the last in the U. S., in 1890.

Census work began in the United States with the beginning of the government. In order to secure a proper apportionment of representatives in the lower house of congress a C. is taken every tenth year. At first it was nothing more than an enumeration of the people, classifying slave and free. Additions and improvements were made until the schedules of 1870 comprised questions as to name, age, sex, color, conjugal condition, place of birth, and place of birth of father and mother. To these were added particulars as to schools, libraries, newspapers, churches, diseases and mortality, pauperism and crime, school, military, and citizenship ages; areas of farms, families and dwellings; the blind, deaf and dumb, insane and idiotic, occupations of the people, wealth, taxation, and public indebtedness, and the amount and value of the products of agriculture and manufactures. The questions were certainly comprehensive enough, but the mode of taking the C. was slow, cumbrous, and unsatisfactory. It was two years and six months after the beginning of the work when the compilation known as the *Compendium* was sent to congress. In the introduction to this compendium Gen. F. C. Walker, superintendent of the ninth C., says: "There is no reason why, with such modifications of existing laws as would insure that the material should come originally to the census office in proper shape for tabulation, the entire compilation should not be concluded within a year from the date of the first receipt of returns. It is not possible for one who has had such painful occasion as the present superintendent to observe the workings of the census law of 1850 to characterize it otherwise than as clumsy, antiquated and barbarous. The machinery it provides is as unfit for use in the C. of the United States, in this day of advanced statistical science, as the smooth-bore muzzle-loading queen's arm of the revolution would be for service against the repeating rifle of the present time. It ought not to be possible that another C. should be taken under this law; such a thing ought not to be seriously proposed. The country has suffered more than enough already of discredit and of loss on account of the wretched insufficiency and inappropriateness of the provisions of this ill-constructed and outgrown statute." The census of 1880 was also made under the superintendency of Gen. Walker and was extremely elaborate. The published material occupied 22 large volumes, the last of which were not issued until 1889. They contain a large number of maps and diagrams bearing on all branches of statistical inquiry, such as agriculture, health, disease, illiteracy, etc. The last census, that of 1890, was conducted by Mr. Robert P. Porter, who was at the outset subjected to much criticism by the press, because he proposed to require each householder to state whether or not his property was mortgaged, and if so, for what purpose. This was denounced as an infraction of the rights of the individual citizen, and so much popular protest was made that this particular line of inquiry was practically abandoned. The census was taken by 175 supervisors, each in charge of a district, who had under their immediate direction some 30,000 enumerators. More than 80,000,000 blanks were used in making the enumeration, which occupied one week. The official bulletin (corrected) of the population of the states and territories was sent by the Superintendent of the Census to the Secretary of the Interior, Oct. 28, 1890. Unofficial figures had been given out long before, as well as unofficial statements of the population of the chief cities and towns. The work of adding the figures and of reducing them to totals, was much simplified by the extensive use of counting machines. The following figures show the cost of the first ten censuses in round numbers: first, \$44,500; second,

\$66,000; third, \$178,500; fourth, \$208,500; fifth, \$378,500; sixth, \$835,000; seventh, \$1,330,000; eighth, \$1,925,000; ninth, \$3,335,000; tenth, \$4,800,000. The preliminary work of the eleventh census (including the actual enumeration, but not the tabulation or publication of volumes) for the year ending June 30, 1890, was \$977,198, of which sum \$172,000 was spent for printing. The entire cost of the eleventh census will probably not be far from \$8,000,000. The population of the entire country as officially announced Oct., 1890, was 62,480,540, including 244,000 Indians.

The census of Alaska was taken under the direction of a special agent, Mr. Ivan Petroff, who in February, 1890, submitted a plan for census work in Alaska, which was adopted. Under this plan the territory was divided into seven divisions, namely: first, the Southeastern or Sitka division; second, the Kodiak division; third, the Oonalska division; fourth, the Nushegak division; fifth, the Kushovim division; sixth, the Yukon division; seventh, the Arctic division. Each division was placed in charge of a special agent, a resident of the division. On account of the difficulties encountered by special agents in traveling through Alaska, and the impossibility of obtaining proper vouchers, etc., Congress allowed the sum of \$7 per day to each agent in lieu of subsistence, which should also cover traveling expenses, ordinary enumerators in other parts of the country being paid on the basis of the number of names collected, and at a rate varying with the sparseness of the population in each district. Subsequently Petroff's returns were discarded by the government because of gross frauds. See also UNITED STATES; POPULATION OF THE WORLD; and the Appendix to vol. XV.

CENT (Lat. *centum*, a hundred), a coin of the United States valued at the one hundredth part of a dollar. Previous to 1782, when a plan for an American coinage was submitted to congress, the colonies had used almost exclusively the coin of England, or pieces specially issued there for their benefit. In 1783, the "nova constellation" copper, as it is called from its legend, was struck in England for circulation in America. From 1785 to 1788 Vermont and Connecticut issued copper coins of their own; as did New Jersey, 1786-87, and Massachusetts, 1787-88. In 1787 a mint established by congress at New Haven, Conn., began coining what are now known as the "Fregio" or "Franklin" cents, which were issued for many years. In 1791 a coin bearing a head of Washington and the words "one cent," was struck in England as a pattern piece, and in 1792 another, without the word "cent," both of these meeting with the President's modest disapproval. In 1792, April 2, congress authorized the issue of a copper cent of 264 grains and a half-cent in proportion. These appeared in 1793, the cent being reduced to 208 grains. In 1796, act of Jan. 26, the weight of the cent was reduced to 168 grains and the half-cent was proportionately reduced, a new design being adopted also. The head of Liberty was changed in 1808 and again in 1816. In 1815 and 1835 no copper coins were issued. By act of March 3, 1851, a three-cent coin, three-fourths silver, was authorized, and in 1853 its weight was reduced from 128 grains to 11.52 grains. By the act of Feb. 21, 1857, the half-cent was discontinued, and the old copper cent was replaced by a smaller coin, composed of .88 copper and .12 nickel, and weighing 72 grains. In 1864, act of April 22, the bronze cent was introduced, weighing 48 grains and consisting of .95 copper and .05 tin and zinc. By the same act the one and two-cent coins were made a legal tender for sums not exceeding 10 cents and 20 cents respectively, and the coinage of two-cent pieces to weigh 96 grains was authorized. In 1865, act of March 3, the one and two-cent coins became each a legal tender to the amount of 4 cents only, and a three-cent coin was authorized, to consist of three-fourths copper and one-fourth nickel, to weigh 80 grains and to be legal tender for any sum not exceeding 60 cents. In 1866, May 16, a new act provided for the coinage of a five-cent piece, three-fourths copper and one-fourth nickel, to weigh 77.16 grains and to be a legal tender for any sum not exceeding \$1. The "coinage act of 1873," Feb. 12, limited the issue of coins of the denomination of cent to a five-cent piece and a three-cent piece (three-fourths copper and one fourth nickel, and weighing 77.16 and 30 grains respectively, and a one-cent piece (.95 copper and .05 tin and zinc, weighing 48 grains). The coins authorized by this act were made a legal tender at their nominal value for any amount not exceeding 25 cents in any one payment. Ten of the present cents weigh just a troy ounce, and 120 cents weigh a troy pound. They cannot be conveniently used for avoirdupois or common weight. The cents issued in 1793, 1799, and 1804, and the copper cent of 1856 are very rare, as are the half-cents of 1793, 1831, 1840-48, and 1852. See NUMISMATICS.

CENTAUREA, a genus of plants of the natural order *compositæ*, sub-order *cynaraceæ*, containing many species of annual and perennial herbaceous plants, chiefly natives of the temperate and cold regions of the eastern hemisphere.—The BLUE-BOTTLE, or CORN BLUE-BOTTLE (*C. cyanus*), is common in cornfields in Europe, and indeed over the greater part of the world. The juice of the florets of the disk, with a little alum, dyes a beautiful and permanent blue.—The large blue-bottle (*C. montana*), a native of central Europe, is frequently cultivated in flower-gardens. Its flowers are considerably larger, and it is a perennial.—SWEET SULTAN (*C. moschata*), a native of the Levant, with fragrant flowers, is also common in flower-gardens. It is an annual or biennial.—Several species, having the involucre spiny, bear the name of STAR-THISTLE.—

CENTAURS ("bull-killers"), a wild race of men who inhabited, in early times, the forests and mountains of Thessaly, and whose chief occupation was bull-hunting. Homer, the first who mentions them, describes them merely as savage, gigantic, and covered with hair. They do not appear as monsters, half-man and half-horse, until the

age of Pindar. The C. are celebrated in Greek mythology on account of their war with the *Lapithæ* (q.v.), and their contest with Hercules. The fact lying at the bottom of Pindar's myth may refer to the impression which the old bull-hunters of Thessaly, who spent almost their whole life, it is said, on horseback, first made on some of the neighboring tribes—viz., that the man and the horse were one creature, which, at least, we know was the opinion entertained by the Mexicans of the Spanish cavalry. On account of their resemblance to the Satyrs, the C. were at a later period introduced into the artistic representation of the Bacchic worship. See **IXION**.

CENTAURUS, the *Centaur*, one of the constellations in the southern hemisphere, represented on the celestial globe by a form half-man and half-horse. The stars in this constellation are, according to Ptolemy's catalogue, 37 in number; according to the *Britannic catalogue*, 35. It contains the stars α Centauri and β Centauri, both of the first magnitude.

CENTAURY, *Erythræa*, a genus of plants of the natural order *gentianeæ*, having a funnel-shaped regular 5-partite corolla. The species are pretty little annuals, natives chiefly of the temperate parts of Europe and Asia, with pink or rose-colored flowers. They possess the tonic and other medicinal virtues of gentian, and although not frequently administered by physicians, are an important domestic medicine; and the tops are collected, when the plant is in flower, by the country people both in England and on the continent of Europe, to be employed in cases of dyspepsia, in intermittent fevers, and as a vermifuge. They contain a substance called *centaurine*, the hydrochlorate of which is said to be an excellent febrifuge.—The common C. (*E. centaurium*) is the species most frequent in Britain; a plant of 8 in. to a foot in height, with flowers collected in loose heads, growing in dry pastures. Two or three other species are found on sandy sea-shores. Nearly allied to these is the **AMERICAN C.** (*sabbatia angularis*), an annual plant with an erect quadrangular stem, extensively distributed throughout the United States and Canada, and much used in the domestic practice of America, as a prophylactic against autumnal fevers in strong infusions and large and repeated doses. The name C. owes its origin to the same legend with the name *centaurea*, although appropriated to plants so different.

CENTENARY (Lat. *centenarius*, from *centum*, a hundred), a hundredth of anything, a period of a hundred years, but usually employed to denote a commemoration of an important event. The centenary of American independence was celebrated by a *centennial* exhibition in 1876; the *bi-centenary* of Pope's birth in 1888; the *ter-centenary* of Shakespeare's birth in 1864; the *octo-centenary* of the Bologna university in 1888.

CENTE'NES. See **TENREC**.

CENTENNIAL EXHIBITION, in the United States, held at Philadelphia in 1876, a hundred years after the declaration of independence. It was opened in Fairmount Park, May 10, 1876. An area of 236 acres was used, and the cost of the five main buildings was \$4,500,000. Before the close there were more than 200 separate buildings within the inclosure. Some idea of the magnitude of the preparations may be obtained from the apportionment of space in the main building, designed for the exhibition of the manufactured products and products of mines and metallurgy, as well as the condition of science and education in all nations. This building covered 20 acres, and was 1880 ft. long and 464 wide, with projecting wings in the center of the sides 416 ft. long, and in the center of the ends 216 ft. long. The exhibition space was on one floor. The roof of the main portion was 70 ft. high. In the center was an elevated square, with sides of 184 ft., having towers 120 ft. high and 48 ft. square at the corners. At the four corners of the building were towers 75 ft. high. The roof was supported by wrought-iron roof-trusses resting upon 672 wrought-iron columns. The sides were closed with glazed sash, above a substructure of brick 7 ft. high, resting on a foundation of massive masonry. Space was apportioned as follows, in square feet: Argentine Republic, 2,861; Austria-Hungary, 24,727; Belgium, 15,598; Brazil, 6,899; Canada, 24,118; Chili, 3,244; China, 6,628; France, 45,460; Germany, 29,629; Great Britain and Ireland, 54,155; India and British colonies, 24,193; Hawaiian islands, 1575; Italy, 8,943; Japan, 17,831; Luxemburg, 247; Mexico, 6,567; Netherlands, 15,948; Norway, 6,959; Orange Free State, 1058; Peru, 1462; Spain and colonies, 11,253; Sweden, 17,799; Switzerland, 6,693; Tunis, 2,015; Turkey, 3,347; United States, 136,684. Within this vast space the nations vied with each other in showing proofs of their industry, wealth, and greatness. A most interesting part of the exhibition was that devoted to the progress of modern education. Another building was the women's pavilion, covering an acre of ground, designed to receive the products of woman's ingenuity and progress. Besides the United States more than a dozen other nations were here represented. This was the first collective display of women's work ever attempted. The art building was called Memorial hall, and remains as a permanent monument of the exhibition. It is a splendid structure, in the renaissance style. On a central tower 150 ft. high stands a colossal statue of America; at the base are four figures of smaller proportions, representing the four quarters of the globe. The building is 365 ft. long by 210 wide, and 59 high; it is of granite, glass, and iron. Machinery hall, next in size to the main building, was 1402 ft. long by 360 wide, its area, including that of its annex, being nearly 13 acres. Steam, water-power, and

shafting were provided by the commissioners. The United States building was 504 by 306 feet. In it were exhibited, as fully as possible, all the operations of government service, Horticultural Hall, in the Moorish style of the 12th c., was built by the city of Philadelphia, and was intended to be permanent. It is of iron and glass, 383 by 193 ft., and 72 in height. Agricultural hall covered a rectangular space 820 ft. long and 540 wide. Great Britain erected three buildings for the use and entertainment of her commissioners; and Germany, Brazil, and Portugal each had a pavilion. The English buildings were fine specimens of the later Tudor architecture. Sweden exhibited a national school-house with educational appliances and furniture complete. France had a building containing charts, drawings, and models of public works. Canada displayed her woods and lumber in log and frame houses. Spain had a soldiers' barracks, and Cuba had an acclimatization garden. Turkey showed in a special building her sponge fisheries. Japan had a model dwelling. Morocco had a Moorish villa for the display and sale of her productions. Chili had a building containing models of amalgamating machines. There were also a number of special edifices belonging to private exhibitors. There was a Turkish café of true oriental type, where Mocha, mastic, Syrian tobacco, and Samian wine were dispensed. There were a Tunisian bazaar, and an Algerine pavilion; Japanese booths, houses, and gardens; a New England farmer's home with the old style of kitchen, and other peculiar structures. There were 26 buildings for the headquarters of as many states, some of them containing large exhibitions of state products; several were made of the stone or wood of the state represented. Thirty or more buildings were erected by private companies or individuals. Among them were the telegraph building, the transportation building, the bankers' building, the American kindergarten, the Bible building, etc. The exhibition was opened to visitors every day except Sunday for six months, closing on the 10th of November. The number of admissions was 9,910,966, of which number 7,250,620 paid the regular fee of 50 cts., and 753,654 the special rate of 25 cts.; 1,906,692 admissions were free.

CENTENNIAL HYMN. See PAINE, JOHN K.

CENTENNIAL STATE. See STATES, POPULAR NAMES OF.

CENTER, a co. in middle Pennsylvania, traversed by the Allegheny and other mountain ridges, Bald Eagle creek, and several branches of the Pennsylvania railroad; 1145 sq. m.; pop. '90, 43,269. Co. seat, Bellefonte. About 14 miles e. of Bellefonte is a remarkable cave known as Penn's Cave (q. v.).

CENTER OF GRAVITY is that point in a body or system of bodies rigidly connected, upon which the body or system acted upon only by the force of gravity, will balance itself in all positions. Though the action of gravity enters this definition, many of the properties of the point are independent of that force, and might be enunciated and proved without conceiving it to exist. By some, accordingly, the point has been called the *center of magnitude*, and by others, the *center of parallel forces*. Such a point exists in every body and system, and only one such point. Every body may be supposed to be made up of a multitude of minute particles connected by cohesion, and so far as its balance under gravity is concerned, each of these may be supposed to be removed, and its place occupied by a force proportioned to its weight. Instead of the body, on these suppositions, we should then have a system of parallel forces, the lines from the various particles to the earth's center being regarded as parallel. But a system of parallel forces (see PARALLEL FORCES) has a single resultant acting through a fixed point, whose position is independent of the position in space of the points of application of the component forces, provided their relative positions in the system continue unchanged. This

Fig. 1.

Fig. 2.

point is the C. of G.; and if it be supported, it is clear that the body will balance itself upon it in all positions. The same reasoning obviously applies to any system of bodies rigidly connected. It is usual to demonstrate this and the general rule for finding the C. of G. by proving it first in the case of two heavy particles forming a body or system, and then extending the proof to the case of any number of particles. Let P and Q (see fig. 1) be two heavy particles. Join P and Q, and divide the line PQ in C, so that weight of P : weight of Q :: CQ : CP. Then C will be the C. of G. of P and Q. Draw ACB horizontal, and PM, QN vertical, meeting AB in M and N. Then if P and Q represent the weights of P and Q, we have P : Q :: CQ : CP. But CQ : CP :: CN : CM by similar triangles. Therefore P : Q :: CN : CM, and P.CM = Q.CN. P and Q, therefore, are balanced about C. See BALANCE and LEVER. This is true in all positions of P and Q, for no assumption was made as to their positions. C, therefore, is their center of gravity. Also, we may conceive P and Q to be removed (see PARALLEL FORCES), and in their stead a particle at C equal to them taken together in weight. If

now, the system contained three, it is clear how we should proceed to find its center of gravity; having found the C. of G. of two, we should consider the system as formed of two—viz., the equivalent of the first two at their C. of G., and the third, when the case would fall under that already treated; and so on, extending the rule to a system containing any number of particles. Apart from this rule, however, it is possible, in the case of most regular homogeneous bodies, to fix upon their centers of gravity from general considerations. The C. of G. of a straight line, for instance, must clearly be in its middle point. So the C. of G. of a uniform homogeneous cylinder must be in the middle point of its axis. It must be in the axis, for the cylinder clearly is equally balanced about its axis. It must also be somewhere in its middle circular section, for it will balance itself on a knife-edge under that section. It must, therefore, be in the point where that section cuts the axis, or in the middle of the axis. The C. of G. of a uniform material plane triangle may be found from similar considerations. The triangle ABC (see fig. 2) may be supposed to be made up of uniform material lines parallel to its base AB; each of these will balance upon its middle point. The whole triangle, therefore, will balance upon the line CD, which bisects the base AB and all lines parallel to it. In the same way, the triangle will balance upon the line AE, bisecting BC. But if a figure balances itself upon a line, its C. of G. must lie in that line. The C. of G. of the triangle is therefore in CD, and also in CB. It must therefore be at g where these lines intersect, g being the only point they have in common. Now, by geometry, we know that g divides CD, so that $Cg = \frac{2}{3} CD$. Hence the rule for finding the C. of G. of a triangle: Draw a line from the vertex, bisecting the base, and measure off Cg , two thirds of the line. g is the center of gravity. By a similar method, the C. of G. of a great number of figures may be determined.

The above method applies only where the figure of the body is regular, and its mass homogeneous. But many bodies, besides being irregular, are formed by the agglomeration of particles of different specific gravities. Of these, the C. of G. can be found only by experiment, though not always satisfactorily. Let the body be suspended by a string, and allowed to find its position of equilibrium. The equilibrium being due to the tension of the string counterbalancing gravity, it follows that the tension is in the same line with that on which gravity acts on the body. But the tension acts on the line of the string, which therefore passes through the center of gravity. Mark its direction through the body. Suspending it then by another point, we should ascertain a second line in which lies the center of gravity. The C. of G., then, must be where these lines intersect.—For the effect on the stability of bodies of the position of the C. of G., see STABILITY.

CENTER OF GRAVITY is the point at which, if the whole mass of a body rotating round an axis or point of suspension were collected, a given force applied would produce the same angular velocity as it would if applied at the same point to the body itself. The C. of G. bears a strong analogy to the center of oscillation. The cases differ only in this, that in the latter the operating forces are supposed to act at every point of the moving body, while in the former there is only one force acting upon one point. The C. of G. is found by the following rule: Divide the moment of inertia of the rotating mass by the mass of the body, and extract the square root of the quotient. The result is the distance of the point from the axis of rotation. The moment of inertia, it may be stated, is the sum of the products of the weight of each point of the mass by the square of the perpendicular distance of that point from the axis.

CENTERING, the frame-work upon which an arch or vault of stone, brick, or iron is supported during its construction. The simplest form of C. is that used by masons and bricklayers for the arches of common windows and doors. This is merely a deal-board of the required shape, upon the curved edge of which the bricks or stones of the arch are supported until they are keyed in. In building bridges or other structures where arches of great span are to be constructed, the C. is usually made of framed timbers, or timbers and iron combined. The arrangement of the timbers should be such, that the strain upon each shall be mainly a thrust in the direction of its length, for if the strain were transverse, a comparatively slight force would snap it, and if a longitudinal pull, the whole structure would be no stronger than the joints holding the pieces of timber together. In arches of great span, such as that of Waterloo bridge, London, a longitudinal pulling strain is almost inevitable in some parts, as a beam of great length would bend to some extent under a thrusting strain. In such cases great skill and care are demanded in the designing and construction of the joints. As an arch is built from the piers towards the keystone, the weight upon the haunches during construction tends to push the crown upwards, and therefore the problem of designing a framed C. involves the resistance of this tendency, as well as the supporting of the weight of the materials.

The C. of Waterloo bridge, designed by Rennie, presents a fine example of the fulfillment of these requirements. The weight is resisted by direct thrust upon beams passing obliquely downwards from various parts; one of each pair of these oblique beams thrusts outwards, and is directly supported by the abutments; the other thrusts inwards towards a support equidistant from the abutments, the yielding of which is prevented by the longitudinal pull of lower and longer oblique beams. In this, and other modern structures, cast-iron shoes have been successfully used for the tying joints subject to the

longitudinal pulling strain. The flexible C., so called from its yielding at the joints, and varying its form with the load put upon it, is now abandoned. It was chiefly used by French engineers. That of Perronet for the bridge of Neuilly is a celebrated example.

Occasionally, when a very great span is required, and the navigation will permit, piers are built, or piles are driven, to support the C., and the design is much simplified thereby.

Cupolas like the pantheon and St. Peter's at Rome, St. Paul's in London, or the flat domes of the Turkish mosques, require very effective centerings.

CENTER OF MAGNITUDE or **FIGURE** (see **CENTER OF GRAVITY**). C. of M. is the point on which plane figures and curved surfaces would balance themselves, supposing their areas to have weight. Thus, the center of a circle is its center of magnitude. Otherwise, C. of M. or F. is a point so situated that all straight lines passing through it, and terminated by the circumference or superficies of the figure or surface, are bisected in it.

CENTER OF OSCILLATION. Referring to the article **PENDULUM**, the reader will see that the time of a pendulum's vibration increases with its length, being always proportioned to the square root of its length. This is strictly true only of the simple pendulum, in which the pendulous body is supposed to have no determinate magnitude, and to be connected with the point of suspension by an inflexible wire without weight. If, however, the vibrating body have a determinate magnitude, then the time of vibration will vary, not with the square root of its length, but with the square root of the distance from the axis of suspension of a point in the body called its center of oscillation.

If each part of the vibrating body were separately connected with the axis of suspension by a fine thread, and entirely disconnected from the rest of the body, it would form an independent simple pendulum, and oscillate as such—the time of each vibration being as the square root of the length of its thread. It follows that those particles of the body which are nearest to the axis of suspension would, as simple pendulums, vibrate more rapidly than those more remote. Being connected, however, as parts of the solid body, they vibrate all in the same time. But this connection does not affect their *tendencies* to vibrate as simple pendulums, and the motion of the body which they compose is a compromise of these tendencies of its particles. Those nearest the axis are retarded by the more remote, while the more remote are urged on by the nearer. Among these particles there is always one to be found in which the accelerating and retarding effects of the rest are mutually neutralized, and which vibrates in the same time as it would if it were unconnected with the other parts of the body, and simply connected by a fine thread to the axis of suspension. The point in the body occupied by this particle is its center of oscillation. By this C. of O. the calculations respecting the vibration of a solid body are rendered as simple as those of a molecule of inconsiderable magnitude. All the properties which belong to a simple pendulum may be transferred to a vibrating body of any magnitude and figure, by considering it as equivalent to a single particle of matter vibrating at its centre of oscillation.

The determination of the position of the C. of O. of a body usually requires the aid of the calculus. It is always further from the axis of suspension than the center of gravity is, and always in the line joining the center of gravity and the point of suspension, when the body is suspended from a point. The rule for finding it in such a case is: If S be the point of suspension, and O the C. of O., $SO = \frac{\sum (md^2)}{M.Sg}$; or it is the quotient obtained by dividing the moment of inertia of the body by the product of its mass into the distance of its center of gravity from the point of suspension.

CENTER OF PERCUSSION. The C. of P. of a body or a system of bodies revolving about a point or axis, is that point in it, which striking an immovable object, the whole mass shall not incline to either side, but rest, as it were, in equilibrio, without acting on the center or axis of suspension. If the body be moving freely, then the C. of P. is that point in it at which its whole impetus is supposed to be concentrated. In this case, if the body struck with its C. of P. an immovable obstacle, and if it were perfectly rigid and inelastic, it would come to perfect repose; whereas, if it struck the obstacle with any other point, a rotatory motion would be produced in it. When the body is moving freely, and there is no rotatory motion, the C. of P. coincides with the center of gravity. If the body be moving round a point or axis of suspension, the C. of P. coincides with the center of oscillation. The more complicated case of a body rotating round an axis within it, would require, for its explanation, analytical formulæ which cannot conveniently be translated into ordinary language. There are many positions which the axis may have in which there will be no C. of P.—i.e., there will be no direction in which an impulse could be applied without producing a shock upon the axis. One case of this sort is that of the axis being a principal axis through the center of gravity.

CENTER OF PRESSURE. The C. of P. of any surface immersed in a fluid is the point in which the resultant of the pressures of the fluid on the several points meets the surface. When the bottom of a vessel containing fluid, or when a plane immersed in

fluid, is horizontal, a pressure on every point of it is the same, being that due to the weight of the column of fluid standing above the bottom or plane. In either case, the pressures at the different points obviously form a system of equal parallel forces, whose center will be the center of gravity of the bottom or plane, their resultant passing through this point being the sum of all their forces. But when the plane is inclined at any angle to the surface of the fluid, the pressure is not the same at all points, but is obviously greater at the lower than at the upper points, for the lower have to support taller columns of the fluid. The resultant of these forces, then, will not pass through the center of gravity of the surface, but through a point below it. This point is the C. of P., and evidently will lie below the center of gravity for all fluids in which the pressure increases with the depth. If the surface pressed upon form part of the containing vessel, and be supposed movable, it will be kept at rest by a pressure equal to the sum of the fluid pressures applied at the C. of P., and acting in the opposite direction. In the case of a vessel with a parallelogram for one side, the C. of P. is at the distance of one third of the height from the bottom. In the case of a triangular vessel whose base is at the bottom, it is one fourth of the height only.

CENTERVILLE, city and co. seat of Appanoose co., Ia., on the Chicago, Rock Island and Pacific, and Keokuk and Western and the Iowa Central railroads, 90 miles s.e. of Des Moines. Coal and limestone underlie the place, and large quantities are shipped. Pork packing and the exportation of live stock are prominent industries, and there are manufactures of lumber, flour, iron, and other articles. There are banks, high school, newspapers, and churches. Pop. '90, 3668.

CENTIGRADE. See THERMOMETER.

CENTIME (Fr. a hundred), in the French monetary system means the hundredth part of a franc, or two mills.

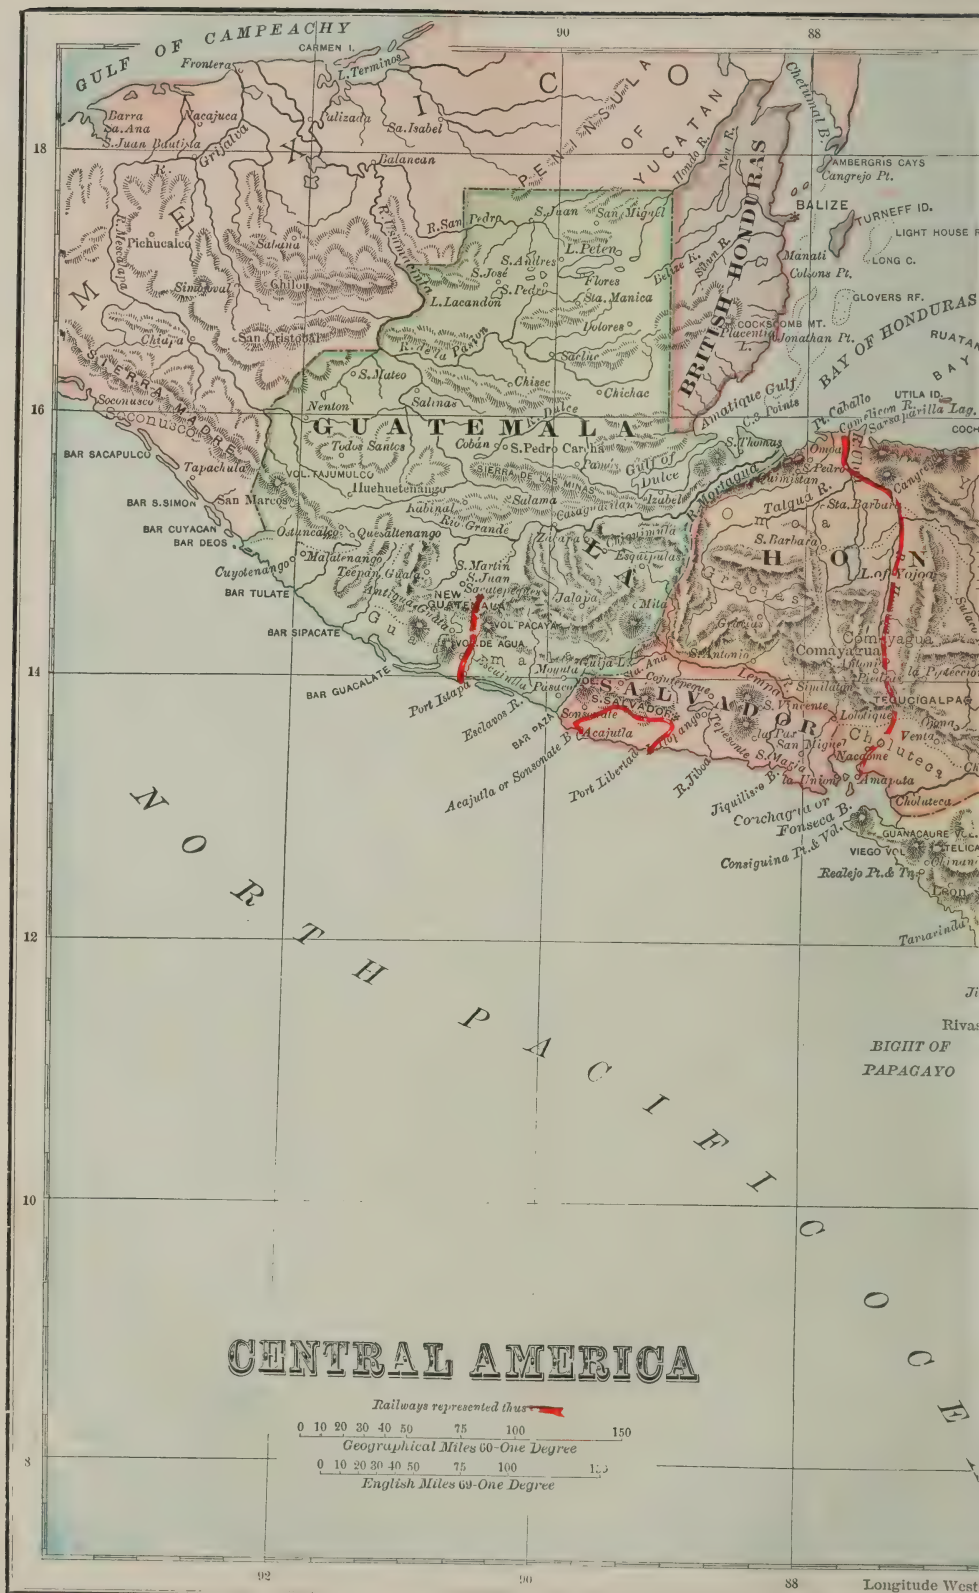

CENTIMETER. See METRIC SYSTEM; also, ELECTRICITY.

CENTPEDE, *Scelopendra*, a genus of *myriapoda* (q.v.), having a long slender depressed body, protected by coriaceous plates, 21 pair of legs, distinct eyes, four on each side, and antennæ with 17 joints. The name is, however, popularly extended to species of nearly allied genera. Centipedes run nimbly, feed on insects, and pursue them into their lurking-places. They have not only a pair of horny jaws, like those of insects, but also another pair of organs closely connected with the mouth, and which are regarded as transformed legs, dilated and united at the base, terminated by a strong hook, and pierced beneath the extremity for the emission of a venomous fluid, which makes their bite quickly fatal to insects, and in the case of the larger species, very painful and even dangerous to the larger animals and to man. The common C. of tropical America (*S. morsitans*) is often 9 in. or a foot in length. A species found in the s. of Europe (*S. cingulata*) is nearly as large, but its bite does not seem to be equally venomous. Humboldt saw Indian children of the tribe of the Chuymas eat centipedes. See *illus.*, INSECTS, vol. VIII.

CENTLIVRE, SUSANNA, an English dramatic authoress, was the daughter of a Lincolnshire gentleman, named Freeman, b. (most probably) in Ireland, about 1670. Her early history is obscure; but such were her wit and beauty, that on her arrival in London, though a destitute orphan, and only 16 years of age, she won the heart of a nephew of sir Stephen Fox, who, however, died shortly after their marriage. Her second husband, an officer named Carrol, lost his life in a duel. Left in extreme poverty, his widow endeavored to support herself by writing for the stage, and after producing a tragedy called *The Perjured Husband* (performed first in 1700), made her appearance on the stage. She afterwards married (1706) Joseph Centlivre, principal cook to queen Anne, with whom she lived happily until the time of her death, Dec. 1, 1723. Her plays—*The Busybody* (of which the leading character, "Marplot," is highly amusing); *A Bold Stroke for a Wife* (1717); and *The Wonder* (1714)—though not distinguished by purity of style or truthfulness of portraiture, are lively in their plots, and have kept their place on the stage.

CENTO (from Lat. *cento*, patchwork), a name applied to literary trivialities in the form of poems manufactured by putting together distinct verses or passages of one author, or of several authors, so as to make a new meaning. After the decay of genuine poetry among the Greeks, this worthless verse-manufacture came into vogue, as is proved by the *Homero-centones*, a patchwork of lines taken from Homer (edited by Teucher at Leipsic, 1793); but it was much more common among the Romans in the later times of the empire, when Virgil was frequently abused in this fashion, as in the *C. Nuptialis* of Ausonius (who gives rules for the composition of the C.), and especially in the *C. Virgilianus*, constructed in the 4th c. by Proba Falconia, wife of the proconsul Adelfius, and giving, in Virgil's misplaced words, an epitome of sacred history! The C. was a favorite recreation in the middle ages. In the 12th c., a monk named Metellus contrived to make a C. of spiritual hymns out of Horace and Virgil.—See *Littérature du Centon*, by M. Delepierre (1875).

CENTO, a t. of central Italy, 16 m. n.w. of Bologna, is pleasantly situated on a fertile plain near the Reno. It is celebrated as the birth-place of the famous painter, Guercino, whose house, adorned with paintings, is still preserved; and in the church of C. are many of his works. Pop. about 5,000.

UNIVERSITY OF ILLINOIS
URBANA

CENTRAL AMERICA, that portion of North America included between the isthmus of Tehuantepec and the isthmus of Darien; including the states or republics of Guatemala, Honduras, Nicaragua, San Salvador, Costa Rica, and British Honduras, or Belize. See **AMERICA**. In 1895 the republics of Honduras, Nicaragua, and Salvador formed a treaty for the purpose of devising means for establishing permanent peace in Central America. A general diet was constituted, and the name of Greater Republic of Central America adopted, which name was to continue until Guatemala and Costa Rica accepted the agreement, when it was to be called the Republic of Central America. Guatemala and Costa Rica formed a treaty of union with the Greater Republic of C. A. in 1897.

CENTRAL CITY, city and co. seat of Gilpin co., Col., on the Union Pacific railroad, 40 m. w. of Denver. It is the centre of supply for a rich mining district; is engaged in gold mining, milling, and smelting; and has national banks, public school library, and newspapers, manufactures mining tools and machinery. Pop. '90, 2480.

CENTRAL FORCES are those which cause a moving body to tend towards some point or center, called the center of force or motion. The doctrine of C. F. has for its starting-point the first law of motion—viz., that a body not acted on by any external force will remain at rest, or move uniformly in a straight line. It follows from this law that if a body in motion either changes its velocity or direction, some external force is acting upon it. The doctrine of C. F. considers the paths which bodies will describe round centers of force, and the varying velocity with which they will pass along in these paths. It investigates the law of the force round which a body describes a known curve, and solves the inverse problem, and many others, the general statement of which could convey no clear idea to the unmathematical reader. As gravity is a force which acts on all bodies from the earth's center, it affords the simplest general illustration of the action of a central force. If a stone be slung from a string, gravity deflects it from the linear path which it would otherwise pursue, and makes it describe a curved line which we know would, in vacuo, be a parabola. Again, the moon is held in her orbit round the earth by the action of gravity, which is constantly preventing her from going off in the line of the tangent to her path at any instant, which she would do, according to the first law of motion, if not deflected therefrom by any external force. To that property of matter by which it maintains its state of rest or motion, unless acted upon by other matter, has been given the name *inertia*.

We will now explain how, through the action of a central force, a body is made to describe a curved path. Suppose it to have moved for a finite time, and conceive the time divided into very small equal parts; and instead of the central force acting constantly, conceive a series of sudden impulses to be given to the body in the direction of the center, at the end of each of the equal intervals, and then observe what, on these suppositions, will happen. Let S (see Fig. 1) be the center, and let the original motion be from A, on the line AB, which does not pass through S. In the first interval, the body will move with a uniform velocity, say from A to B. In the second, if acted on by no force, it would move on in AB produced to c, Bc being = AB. But when it arrives at B, it receives the first sudden impulse towards S. By the composition of velocities (q. v.), it will move now with a new but still uniform velocity in BC instead of Bc, BC being the diagonal of the parallelogram of which the sides represent its impressed and original velocity. Having reached C at the end of the second interval, it receives the second impulse towards S. It will now move in CD instead of in BC produced. If, then, we suppose the periods of time to be indefinitely diminished in length, and increased in number, the broken line ABCD will become ultimately a continuous curve and the series of impulses a continuous force.

Going back, however, on our suppositions, we may here establish Newton's leading law of central forces. That the body must always move in the same plane, results from the absence of any force to remove it from the plane in which at any time it may be moving. The triangles ASB and BSC are clearly in the same plane, as the latter is on that in which lie the lines Bc and BS. Also, since the triangles ASB, BSc are equal, being on equal bases, AB, Bc, and triangle BSC = triangle BSc, as they are between the same parallels, cC and BS, it follows (by Euclid I. 37) that ASB = BSC. So BSC = CSD; and so on. In other words, the areas, described in equal times by the line (called the radius vector) joining the center of force and the body, are equal. As this is true in the limit, we arrive, by the composition of the small equal areas, at the law: that the areas described by the lines drawn from the moving body to the fixed center of force, are all in one plane, and proportional to the times of describing them. Very few of the laws of C. F. are capable of being proved like the preceding, without drawing largely on Newton's lemmas, with which we shall not suppose the reader to be acquainted.

Centrifugal and Centripetal Force.—We have shown that a body continually drawn to a center, if it has an original motion in a line that does not pass through the center, will describe a curve. At each point in the curve, it tends, through its inertia, to

Fig. 1.

recede from the curve, and proceed in the tangent to it at that point. It always *tends* to move in a straight line in the direction in which it may at any time be moving, and that line, by the definitions of a tangent and of curvature, is the tangent to the curve at the point. At the point A (see fig. 2), it will endeavor to proceed in AD: if nothing hindered it, it would actually proceed in that line, so as, in the time in which it describes the arc of the curve AE, to reach the point D, and thus recede the length DE from the curve; but being continually drawn out of its direction into a curve by a force to a center, it falls below the point D by the distance DE. The force which draws it through this distance is called the centripetal force, and that which would make it recede in the same time through

Fig. 2.

the distance DE from the curve is called the centrifugal force. It may be remarked that the centrifugal force is not, like the centripetal, an impressed or external force acting on the body. It is simply the assertion of the body's inertia under the circumstances produced by the centripetal force.

Many familiar illustrations will occur to the reader of the action of what is called the centrifugal force. A ball fastened to the end of a string, and whirled round, will, if the motion is made sufficiently rapid, at last break the string, and fly off. A glass of water may be whirled so rapidly that, even when the mouth is pressed downwards, the water will still be retained in it, by the centrifugal force pressing it up against the bottom of the glass. The centrifugal action will be found to increase with the velocity. In all cases of a body moving in a circle, the force, it can be proved, varies as the square of the velocity of the body at the moment, and in the inverse ratio of the radius. As in this case the velocity varies as the radius inversely, it follows that the force is as the inverse cube of the radius. As in the case of circular motion the body always is at the same distance from the center, it follows that the centrifugal and centripetal forces are equal at all points of a circular orbit. The general law for all orbits is, that the centrifugal force varies as the inverse cube of the distance from the center. As the attractive force of gravitation varies as the inverse square of the distance, it may hence be shown that the centrifugal force gives perfect security, notwithstanding the constant attraction of the sun, that the planets, so far as that attraction is concerned, will never fall into the sun.

The doctrine of C. F. owes more to Kepler and sir Isaac Newton, of whose philosophy it makes a considerable branch, than to all the rest of the philosophers, though almost all the leading mathematicians have contributed to it. The doctrine of centrifugal forces was first mentioned by Huygens, at the end of his *Horologium Oscillatorium*, published in 1673; but Newton was the first who fully handled the doctrine, at least so far as regards the conic sections.

CENTRAL HEAT involves the theory that the temperature of the earth increases from its surface towards its center. Observations in mines and in boring artesian wells seem to justify such a conclusion, and the inference therefore is that the solid earth is a mere crust, at most but a few miles thick, within which all matter must be in a state of fusion. Observers have estimated the increase of heat at 1° F. for 50 to 60 ft. of depth. Eminent philosophers, however, reject the theory, and attribute the phenomena to local heat. They argue that if such a mass of fire existed in the interior the crust would soon be melted. Some contend that if the earth ever cooled from a state of fire to its solid form, the cooling must have commenced in the center. The most that can be said is that it is still an open question, while experiments and indications seem to favor the theory of a fiery and fluid interior.

CENTRALIA, a city in Marion co., Ill., on the Illinois Central and several other railroads; 112 m. n. of Cairo. There are repair shops of the Illinois Central railroad, coal-mines, iron and steel works, public library, several public parks, high school, national bank, daily and weekly newspapers, and a large fruit trade. Pop. '90, 4763.

CENTRAL INDIA POLITICAL AGENCY, the official name for a group of feudatory states in the middle of India, the principal of which are Gwalior (Scindiah), Indor (Holkar), Rewah, and Bhopal. The total number, great and small, comprised in the C. I. P. A. is 71; covering about 90,000 sq. m., and having a pop. of 8,000,000. These states have nothing in common except a diplomatic connection with Great Britain.

CENTRALIZATION, a term which has lately come into general use for expressing a tendency to administer, by the sovereign or the central government, matters which had been previously under local management. We cannot properly use the term towards an established despotism, for there everything is already directed from the center. The legitimate application is to a state of change from local to central management—a change in the opposite direction would, on the same principle, be called localization. Of this latter change, however, it can scarcely be said that we have any recent example, unless it may be found in the systems of self-government lately communicated to some of the British colonies. Ever since the existing European states began to grow out of

the chaos of the fall of the Roman empire, there has been a continued progress in centralization. That empire itself was, however, the greatest instance of C. which the world has yet seen. In it the numerous municipalities and other local organizations originally existing in Italy, and communicated to the colonies, were entirely centralized. The empire, such as it had been in the days of Constantine, was the type after which the European monarchs, such of them especially as became more powerful than their neighbors, were ever striving; and a few of them, such as Charlemagne, and, long afterwards, Charles V., seemed to have almost restored it. In Gt. Britain, we trace C. from the time when there were about a dozen kings in Britain, and perhaps as many in Ireland, till the united kingdom came under the rule of one monarch. A subsidiary C. at the same time made silent progress, absorbing the feudal power of the aristocracy and the municipal privileges of the corporations. In other countries—as, for instance, in France, notwithstanding her desperate struggles for freedom, this process of C. has tended to a pure irresponsible despotism. With so sad a result before their eyes, a distrust of C. has not unnaturally been felt by some inhabitants of Great Britain. But the British constitution possesses a grand remedy, which turns the process to good use instead of mischief. While administrative authority has been centralizing in the crown, the controlling power of parliament has been increasing at a more rapid ratio, so that the vesting of a function in the crown or central government, means the putting it under the control of parliament, and especially of the people's representatives in the house of commons. There is nothing done in any of the offices under the government for which a secretary of state, or some other member of the ministry, may not at any time be called to account in parliament. The efficiency of this control was in a manner proved by one or two instances in which offices with central powers were created, without being connected with any of the great state departments. There were, for instance, the English poor-law board, and the board of health. Both created much discontent and outcry about C., and it was found necessary to transfer their functions to the great government departments, the heads of which are immediately responsible to parliament. It is not the policy of this country in any case to abolish local management, but rather to aid and direct it from the central authority.

CENTRAL PARK. See NEW YORK CITY.

CENTRAL PROVINCES, a chief commissionership of British India, with an area of 115,936 square miles, and a population (1891) of 12,945,000. The chief-commissionership was constituted in 1861, when the territories previously known as the Nagpur province and the Sagar and Nerbudda territories were united under the name of the Central Provinces. This tract comprising almost every variety of soil and physical aspect, inhabited by races of very diverse origin, is bounded n. by the feudatory state of Rewah, the small native states of Bundelkhand, and by the district of Latapur in the Northwest Provinces; on the n. and e. by the Chhota Nagpur division, the Oressa tributary states, and the n. districts of Madras; on the s. by the Godavari district; and on the s.w. and n.w. by the states comprising the Central India Political Agency. The Central Provinces are separated into four divisions, or commissionerships: Nagpur, Jabalpur, Nerbudda, and Chhatisgarh, comprising 18 British districts; and there are several native states, having a total area of 29,435 sq. m. The country is intersected by the Great Indian Peninsula and the East Indian railroads.

CENTRIFUGAL, a machine employed in the process of clarification (q.v.). It consists of a circular vessel provided with an outlet in the centre and also at the circumference. The vessel is so constructed as to be capable of being made to revolve at a very high rate of speed. When the muddy liquid is placed in the vessel and the whole caused to revolve, it is found that the particles of dust, mud, or other matter fly to the circumference, leaving the liquid in the centre practically clear. By suitable arrangements the clear liquid can be drawn off.

CENTRIFUGAL AND CENTRIPETAL are terms used in botany to designate two different kinds of inflorescence, or modes of flowering of plants. When the flower-bud which terminates the floral axis, and is central in the inflorescence, is the first to expand—in which case the others are developed in succession from the center outwards—the inflorescence is said to be *centrifugal*. When the outermost flowers expand first, the inflorescence is *centripetal*, as is the case in catkins, spikes, and racemes, in which the flowers nearest the base are the first to expand, and those nearest the apex the last. These modes of inflorescence are very characteristic of different plants, of genera, and of orders.

CENTRIFUGAL FORCE. See CENTRAL FORCES.

CENTRIPETAL FORCE. See CENTRAL FORCES.

CENTUM VIRI, judges among the Romans appointed to decide common causes among the people. Three were chosen in each tribe. The extent of their jurisdiction is not clearly understood, but it was probably confined to unimportant causes.

CENTURIATORS OF MAGDEBURG. See MAGDEBURG CENTURIES.

CENTURION, a Roman infantry officer who originally commanded a hundred men, but afterwards an indefinite number. They were of two grades, and were chosen by the tribunes. Their duties were to drill the soldiers and appoint them tasks; and they had power to punish for minor offenses.

CENTURY PLANT. See AGAVE.

CEOS. See ZEA.

CEPHALALGIA. See HEADACHE.

CEPHAË' LIS. See IPECACUANHA.

CEPHALAS' PIS, a genus of fossil ganoid fishes, of which six species have been described, two belonging to the upper Silurian and four to the Devonian measures. The head was protected by a large ganoid plate, sculptured externally with circular radiating markings. Agassiz gave the name *C.* (buckler-headed) from this extraordinary covering, which has very much the appearance of, and was formerly supposed to be, the cephalic shield of an *asaphus*. The body was covered with rhomboidal enameled scales, and furnished with dorsal and pectoral fins: it terminated in a large heterocercal tail. In a graphic description of this fossil in his *Old Red Sandstone*, Miller thus sketches the general appearance of the animal: "Has the reader ever seen a saddler's cutting-knife—a tool with a crescent-shaped blade, and the handle fixed transversely in the center of its concave side? In general outline, the *C.* resembled this tool, the crescent-shaped blade representing the head, the transverse handle the body." See *illus.*, SILURIAN AND DEVONIAN FOSSILS, vol. XIII.

CEPHALIZA' TION, a word used to indicate the degree in which the head, or, more accurately, the brain, dominates over the remainder of the animal structure. The distinction between a higher and a lower cephalization may be indicated thus:

SUPERIOR CEPHALIZATION.

More of the anterior appendages serve the head, in supplying food, etc.

The structure of the head is compacted, and its form abbreviated.

The posterior part of the body is abbreviated and compacted.

The anterior extremity tends upward; finds its limit in man, and is erect.

INFERIOR CEPHALIZATION.

Fewer of the anterior appendages serve the head.

The structure of the head is loose and imperfect; the form is elongated and enlarged.

Great length of tail shows inferiority of grade.

The anterior extremity tends downward, finds its limit and is horizontal in the fish.

Degradation often extends to the absence of essential parts, as teeth, limbs, senses, and is often indicated by gross enlargement of mass, accompanied by stupidity and sluggishness.

Degrees of cephalization may be illustrated by the subdivisions of the mammalia, beginning with the lowest: 1. The mutilates, in which the limbs are wanting, or are degraded to fins; as whales, dolphins, etc.: 2. Herbivores, or plant-eaters; as the elephant, horse, deer, hog, etc.: 3. Carnivores, or flesh-eaters; as the lion, bear, dog, wolf, etc.: 4. Quadrumanes, including monkeys: 5. Bimanes, including mankind. Following this arrangement, as we ascend step by step, we find constant degrees of development corresponding to higher cephalic character, and showing itself in every phase of organized structure. In locomotion, for example, we find the limbs of (1) the mutilates fit only for paddling the body about in the element which gives it support; those of (2) the herbivores carry them from place to place; those of (3) the carnivores carry them about, and serve to grasp and tear their prey; those of (4) the quadrumanes serve for locomotion, for grasping prey, for carrying food to the mouth, and for carrying and defending their young; while in (5) man the fore limbs are relieved from service of locomotion, and are fitted not merely for feeding, for carrying, for defense, but also for an infinity of purposes, to which they are guided by the acuter sensibility of the brain. Similar steps of gradation may be found in other respects, as in the tail, the teeth, the form of the skull, etc. The principle may be further illustrated by the gradations of the lower orders, as in the articulates, going from the worms through the crustaceans to the insects; or in insects, from myriapods through spiders to the true insects; as in the varieties of man, in which the lower races have projecting jaws, retreating foreheads, and enlarged basal brains. With increased brain-force we find diminished jaw, less facial angle, elevated and enlarged forehead, the head generally shortened from front to rear, a larger cavity for the brain, and a greater weight thereof. Finding this constant progression from lower to higher developments, whose exponent is larger and more efficient brain, with nicer adaptation of mechanism for all the functions of life; finding also evidence of a similar gradation in sensation, sensibility, intelligence—everywhere the material more and more subordinated to the immaterial, the body conformed to the spirit, and ruled by it—it is not strange that men should look for a law of development, pervading and controlling all animated nature, or that they should expect to find in this law a formula of the relation between thought and matter, as a function of

the brain. But, while there may be abundant reason for supposing that such a law of relationship might exist, and that if demonstrated it might account logically for a vast and rapidly growing mass of observed facts, it is evident that no such law has yet been proved. Nor, indeed, does it now seem that such a law can be demonstrated without the admission of axioms and postulates, which involve as great strains upon the philosophic imagination as the very principles which such demonstrated law would antagonize and overthrow.

CEPHALO'NIA, or **CEFALONIA**, the largest of the seven Ionian islands (q.v.), is situated at the entrance of the gulf of Lepanto or Corinth, in lat. $38^{\circ} 3'$ to $38^{\circ} 30'$ n., and long. $20^{\circ} 21'$ to $20^{\circ} 49'$ east. It is irregular in shape. Its greatest length is about 32 m., and its total area 302 sq. miles. Its surface is mountainous, the soil, for the most part thin, and water very scarce. The inhabitants, however, are industrious and enterprising, and have planted vineyards wherever the grape will grow, and currants and olive-oil are also produced for export. The climate is warm and agreeable. The population in 1889 amounted to 80,178. The numbers who are brought up to the medical profession are remarkable; it is said that there is hardly a town in the Levant which has not a practitioner from Cephalonia. The inhabitants are also much more disposed to engage in foreign trade than those of Corfu or Zante, and own more vessels. C. is subject to many, but slight earthquakes. There was formerly a small English garrison at Cephalonia. Steamers ply between it and Malta, Patras, and Trieste. The language spoken is a Greek dialect. The chief towns are Argostoli (q.v.) and Lixuri.

C. is called by Homer Same or Samos, and during the heroic ages was subject to Ulysses, whose residence was in the neighboring isle of Ithaca (q.v.). Later, C. appears under the name of Cephallenia. It successively fell into the hands of the Athenians, Romans, Byzantines, and Venetians, from the last of whom it was several times wrested by the Turks. On the ruin of the Venetian republic in 1797, it was seized by the French, who were in their turn dislodged by the Russians. In 1809, it came into the possession of England. It was ceded to Greece in 1864.

CEPHALOP'ODA (Gr. head-footed), a class of mollusks, the highest in organization of that division of the animal kingdom. To this class belong the nautili, spirula, argonauts, poulpes, squids or calamaries, cuttle-fish, etc., of the present time, and the ammonites, belemnites, etc., of former geological periods. The C. are all marine, and only a few of them are capable of leaving the water, and moving about in search of food on shore.

The C. receive their name from having organs of prehension and locomotion attached to the head, an arrangement towards which a gradual approach may be traced in the highest gasteropod (q.v.) mollusks. These organs have been variously designated *arms*, *feet*, and *tentacula*. They "have no true homology" with the limbs of vertebrate animals, but are only analogous to them in respect of the purposes which they serve.—The body of the C. is a bag, formed of the *mantle* (see *MOLLUSCA*), open only at the end to which the head is attached. In some, this bag is almost spherical, and locomotion is accomplished only by the appendages of the head; in others, the body is elongated, and furnished with two fin-like expansions, which are the principal instruments of locomotion. In locomotion by the fins, a cephalopod swims like a fish, with the head first, and often very rapidly; in locomotion by the arms, it draws itself along, laying hold of any object within reach by means of suckers, with which the arms are furnished. Some C. are capable also of moving backwards through the water by alternate contractions and expansions of a muscular web which unites the bases of the arms; some appear to depend for a similar power of swimming backwards upon the forcible ejection of water from the 'funnel' below the eyes.

The head of a cephalopod is roundish, generally furnished with two large and prominent eyes, very similar in structure to those of vertebrate animals. There are also ears, but they consist merely of little cavities, one on each side of the brain, in each of which is suspended a membranous sac containing a small stone. The organs of smell are not very certainly known, but it appears that the C. possess this sense, as well as that of taste, of which the character of the tongue is much more indicative than in many vertebrate animals.—The brain forms a ring around the gullet. The whole nervous system is more complex than in the lower mollusks.—The mouth opens in the midst of the circle of arms. It is furnished with a strong horny beak of two mandibles, moving vertically, not unlike the bill of a parrot, but the upper mandible the shorter of the two.—The digestive apparatus is very complicated. The gullet swells out into a crop, and there is a gizzard as muscular as that of a bird. The intestine, after a few convolutions, terminates in the cavity which contains the gills, at the base of the funnel by which the water is ejected after having supplied air for respiration. This cavity is situated within the mantle or bag, and separated from the other viscera by a membranous partition. Into it the water is freely admitted by means of a slit or valvular opening, being drawn in by muscular action, and again expelled with considerable force through the funnel, which opens at the neck, and with its current all secretions, eggs, and excrements are carried forth. There are only two gills in the greater number of existing C., the only exceptions being the two or three known species of *nautilus*, which have four gills; and

two-gilled C.—the order *dibranchiata*—are in many respects of higher organization than the four-gilled—the order *tetrabranchiata*—which, although containing so few recent, contains a vast number of fossil species. Each gill consists of many membranous plates, fixed to two sides of a stalk.—The heart in the *tetrabranchiata* consists of a single ventricle only; but besides this *systemic* heart, the *dibranchiata* have two *branchial* or *respiratory* hearts, contractile reservoirs, one for each gill, by which the blood is forced into these organs.

The “arms” or “feet” are very numerous in the *tetrabranchiata*, not provided with suckers, but hollow, and with long retractile tentacula; in the *dibranchiata* they are only eight or ten in number, furnished with suckers (*acetabula*); two of them, when they are ten in number, being much longer than the rest, and differing from them in form. The suckers are very admirably constructed—an adhesive disk of muscular membrane, often having a cartilaginous circle, capable of most exact application to any object, with an aperture in the center leading into a cavity, the bottom of which can be retracted like a piston so as to form a vacuum, and render the adhesion of the sucker close and firm, whilst on the muscular action being interrupted or reversed, it immediately lets go its hold. The poulpe has each of its eight flexible arms crowded with 120 pairs of such suckers, and as an animal of this kind exists on some tropical shores, with arms about 2 ft. long, it is not wonderful that it is reckoned dangerous. Still more formidable, however, are the hook-squids of the South seas, the two long arms of which have suckers furnished in the center with a hook to enter into the flesh of any creature of which they may lay hold, and so more effectually to secure their prey.

The sexes are distinct in all the cephalopoda. The eggs have a horny covering, and after their extrusion from the parent, become agglutinated into masses of various forms. The young, from the first, very much resemble the mature animals, except in size.

All the *dibranchiata* are provided with a peculiar organ of defense, called an “ink-bag,” which is wanting in the *tetrabranchiata*. This ink-bag is filled with a peculiar secretion, capable of being expelled at will to darken the water, and facilitate the escape of the cephalopod.

The *tetrabranchiate* C. have a chambered shell. See NAUTILUS. The *dibranchiate* C. have no external shell—the shell of the female argonaut (q.v.) being scarcely an exception—but they have an internal shell (cuttle-fish bone, etc.), sometimes merely rudimentary, included between two folds of the mantle, and apparently intended to give support to the soft body of the animal.

The C. are all very voracious, feeding on fish, mollusks, crustaceans, etc. Even a powerful crab is not safe from the attacks of a *dibranchiate* C. little bigger than itself; the arms, so abundantly provided with suckers, seize it, and trammel every movement, whilst the parrot-like beak is strong enough to break the hard shell.

Fossil C. exist in all the strata which form the earth's crust. The order *tetrabranchiata* is almost exclusively a fossil order, being represented by not more than four recent species. With the exception of two genera, *nautilus* and *aturia*, this order is confined to primary and secondary rocks. The two groups into which it is divided are also characteristic of geological epochs. The *nautilida*, with simple or gently undulating septa, and siphuncle central or in the inner margin, belong, with the exception of the two genera just referred to, to the paleozoic rocks. Including a small group which, while it has the siphon on the external margin, has yet simple septa, the *nautilida* are represented by 145 Silurian, 158 Devonian, and 91 carboniferous species. The *ammonitida* have the siphuncle always on the outer margin of the shell, and the septa with corrugated or lobed margins. This group, with the exception of *goniatites*, a paleozoic genus, is peculiar to, and co-extensive with, the secondary strata. Of the 930 species that have been described, more than the half belong to the genus *ammonites* (q.v.).

The order *dibranchiata* is found first in the lias, and extends through the more recent strata, receiving its full development in our present seas. Scarcely 90 fossil species have been described, while more than double that number are known as recent animals. See AMMONITES, ARGONAUT, BELEMNITES, CALAMARY, CERATITES, CUTTLE-FISH, GONIATITES, HOOK-SQUID, NAUTILUS, OCTOPODA, ORTHOCERAS, POULPE, etc.

CEPHALOPTERA (Gr. head-wing), a genus of cartilaginous fishes of the ray family, the type of a sub-family, *cephalopterida*. The pectoral fins are very much elongated, so as to give great breadth to the fish. The tail is slender and without fin, but armed near its origin with a great spine. The head is terminated in front by a straight line, and on each side of it there projects a membrane (*precephalic fin*) rolled upon itself, and resembling in shape a pointed horn. The name HORNED RAY has therefore sometimes been given to these creatures, of which only one species, *C. giorna*, has ever been found on the British coasts. It is not uncommon in the Mediterranean, and there acquires a great size; one is mentioned as having been taken off Messina, which weighed 1250 lbs.—more than half a ton. But this is small in comparison with the size of some of the *cephalopterida* which occur in tropical seas: one taken at Barbadoes required seven yoke of oxen to draw it. They are very dangerous to swimmers and bathers.

CEPHEUS, a constellation of the northern hemisphere, containing, according to the Britannic catalogue, 35 stars. Its principal star is Alderamin, of the third magnitude.

CEPHISSUS is one of the two principal rivers of Athens. Nearly all the rivers of Greece are small, rapid torrents—entirely dry, or a mere chain of pools during the summer months; but the Cephissus has a constant supply of water from the numerous springs on the side of Mount Parnes. Its waters, however, never reach the ocean through the natural outlet, or mouth of the river, since by far the larger portion is diverted into artificial channels for purposes of irrigation; and what little is not exhausted in this use finds an outlet through the long tunnels at the Piræus.

CEPOIA. See **BANDFISH**.

CERAC'CHI, GIUSEPPE, 1760–1801; a native of Corsica who was active in establishing a republic in that island in 1798. He took refuge in France, and with others undertook the assassination of Napoleon. The deed was to have been done while the consul was at the opera, Oct. 10, 1800, but there was a traitor among the conspirators, and C. and three others were seized, tried, and executed. C. was a sculptor of some note.

CERAM', an island in the Moluccas archipelago, lies n.e. of Amboyna, between 2° 44' 30" and 3° 30' 30" s. lat., and 129° 30' and 130° 53' e. long., and is divided into Great and Little Ceram by the isthmus of Taruno. Area, 7025 sq. m. Pop. about 100,000. C. belongs to the Netherlands.

CERAM'BYX, a Linnæan genus of coleopterous insects, included among those which, on account of the length of their antennæ, are usually known as **LONG-HORNED BEETLES**, and now generally regarded as the type of a tribe or family. To this tribe belongs the musk beetle of England (*callichroma moschata*), remarkable for its strong and agreeable odor, which, however, is nearer that of roses than of musk. Some foreign species have the odor of musk in great perfection. *C. heros* is one of the largest European beetles.

CERAMIA'CEÆ, a sub-order of *algæ* (q.v.), also called **FLORIDEÆ**, and consisting of sea-weeds of a rose or purplish color, with fronds formed of cells arranged in rows, sometimes in a single row; the *sporocarps* containing cells or *spores*, often in fours (*tetraspores*), with a transparent *perispore*, and inclosed in receptacles of very various form and structure. They are most abundant in the seas of the northern temperate zone. Many of them are very delicate and beautiful. A considerable number furnish agreeable articles of food of a gelatinous nature, as dulse (q.v.), carrageen (q.v.) or Irish moss, and certain species of *plocaria* (q.v.), which are much used on the sea-coasts of the East Indies. The edible swallows' nests of the east are supposed to be formed of a sea-weed of this sub-order, a species of *gelidium*.

CERAMIC (Gr. *keramos*, potter's clay, from *kaio*, to burn, and *era*, earth), a term used to designate the department of plastic art which comprises all objects made of clay, such as vases, cups, bassi-relievi, cornices, and the like. See **POTTERY**.

CERAMICUS, a public ground, or potter's field, outside of the walls of Athens, where citizens killed in war were buried at the expense of the state.

CERASTES, or **HORNED VIPER**, a genus of serpents of the family *viperidæ*, distinguished by a broad depressed heart-shaped head, the scales of which are similar to those of the back, and particularly remarkable for the development of one of the scales of each eyelid into a spine or horn, often of considerable length. The tail is very distinct from the body. This genus is exclusively African, and very venomous. The only known species, *C. cornutus*, the horned viper of the n. of Africa, was called C. by the ancients, the name being derived from the Greek *keras*, a horn. It was correctly described by the traveler Bruce, but his description was for some time regarded with incredulity. See *illus.*, **REPTILES**, vol. XII.

CERATE (Lat. *cera*, wax), a compound of wax with other oily and medicinal substances in such proportions as to have the consistence of an unguent (q.v.). Simple C. is made by melting together three parts of white wax, six of olive-oil, and one of spermaceti; they are to be heated together, and stirred into a uniform substance, while cooling.

CERATITES, a genus of ammonitidæ, peculiar to, and characteristic of, the trias. They are distinguished from the other members of the family by having the lobes of the sutures serrated, while the intervening curves, directed towards the aperture, are simple. Twenty-six species have been described. See *illus.*, **MUSCHELKALK PERIOD**, vol. X.

CERAUNIAN MOUNTAINS, a name given by the Greeks to two mountain chains the first being probably the e. extremity of Caucasus; according to Strabo that portion of the Caucasus which looks down upon the Caspian sea, where he locates the land of the Amazons. The second, called also "Acroceraunian," extended along the coast of the Ionian sea. These mountains were often mentioned in ancient poetry. The chain is now called Khimara, Chimara, or Chinari.

CERBERUS (Gr. *kerberos*), in Greek mythology, was the name of the many-headed dog—the offspring (according to Hesiod) of Typhon and Echidna—who guarded the portal of the infernal regions. Later writers describe C. as only three-headed, with the tail and mane composed of serpents, though the poets sometimes encumber him with

100 heads.—A northern constellation, near the hand of Hercules, was named *C.* by Hevelius.

CERCARIA, a name formerly given to a supposed genus of *entozoa*, at first, from their minute size, mistaken for *infusoria*, but now known to be the young of *trematode worms*. In the form to which the name *C.* was given, these creatures consist of an oval body with a thread-like tail; and swim about with great activity in water, but exhibit a strong instinctive propensity to penetrate into the soft bodies of insect larvæ, which they do by means of a spine-like weapon projecting from their head. The tail, as no longer needed, is now left behind, the closing of the wound through which the *C.* enters apparently nipping it off. Within the body which it enters, the *C.* loses also its spine, becomes encysted, and awaits its passive migration into an animal of higher kind, there to become a trematode worm. When it does not succeed in finding, in due time, a larva into which to enter, the *C.* gathers itself up into a ball; emits a mucous secretion, which soon hardens; and incessantly turning round within this mucous mass, becomes invested with a sort of shell, in which form it is not unlikely to be swallowed by some vertebrate animal. The *C.* is not the immediate offspring of a parent like itself. It is generated in a curious little animated sac, which is to be found buried among the organs of fresh-water mullusks, and within which this development of young takes place by gemmation. See GENERATIONS, ALTERNATION OF.

CERCELEE, or **RECERCELEE**, in heraldry, is a cross circling, or curling at the ends, like a ram's horn.

CER/CIS. See JUDAS'S TREE.

CERCOCEBUS (Gr. tail-ape), a genus of monkeys, natives of Asia and Africa, included by some naturalists in the large genus *cercopithecus*. These monkeys have large cheek-pouches, large callosities, and long tails. The species commonly called MANGABEYS, or WHITE EYELID MONKEYS, are commonly referred to this genus, besides the CALLITHRIX, or GREEN MONKEY, and the MALBROUK, or DOG-TAILED BABOON.

CERCOPITHECUS (Gr. tail-ape), a genus of monkeys, containing a large number of species, natives of Asia and Africa, but chiefly of Africa. They are called *guenons* by French naturalists, but they have no common English name more distinctive than monkey. They have cheek-pouches and callosities, and a long but not prehensile tail. A MONA, or VARIED MONKEY (*C. mona*)—an African species—in the Parisian menagerie, was remarkable not only for the cunning and adroitness with which it searched and rifled the pockets of visitors, but also for the readiness with which it applied a key to the opening of a lock, untied knots, undid the rings of a chain, and performed other similar feats. See *illus.*, MONKEYS, vol. X.

CERDO CYON (Gr. cunning-dog), a genus of *canidæ*, apparently intermediate between true dogs and foxes, natives of South America. They are sometimes called Aguara foxes. Their aspect is thoroughly vulpine, as are also their manners. Some of them add to the dispositions of ordinary foxes a singular propensity to steal and secrete brilliant or gaudy objects. A Brazilian species has been known to carry pocket-handkerchiefs into the woods. Some are natives of the coldest parts of South America, and have a rich fur.

CERDONIANS, a sect of Gnostics, founded by Cerdo, a Syrian, who came to Rome about 140 A.D. They held that there were two primal causes—the perfectly good, and the perfectly evil. The good created the world, is the God of the Jews, and the author of the Old Testament. Jesus Christ is the son of the good Deity: he was sent into the world to oppose evil; but his incarnation, and consequently his sufferings, were mere appearance. Deeming the human body the work of the evil deity, the Cerdonians prohibited marriage, wine, and flesh-eating, and advocated fasting and other austerities. Cerdo rejected the Old Testament, and all of the New, except a part of Luke's gospel and Paul's epistles.

CERE. See BILL.

CERE'A, a t. of n. Italy, about 19 m. s.s.e. of Verona. It is a straggling place, with the remains of an old castle. Pop. 7000. The Austrians defeated the French here in 1798.

CEREA LIA, or **CE'RÉAL GRASSES**, so named from Ceres (q.v.), are the plants which produce grain or corn; in other words, all the species of grass (*graminæ*) cultivated for the sake of their seed as an article of food. They are also called corn-plants or bread-plants. They do not belong to any particular tribes of the great order of grasses, but differ from each other botanically, perhaps as much as any plants within the limits of that order. The seeds of the grasses in general being indeed farinaceous and wholesome, the employment of particular species as bread-plants seems to have been determined chiefly by the superior size of the seed, or by the facility of procuring it in sufficient quantity, and of freeing it from its unedible envelopes. Some of the grains, as wheat and barley, are produced in ears or close-set spikes; some, as a few of those called millet, in spike-like panicles; others, as oats and rice, in very loose panicles. The form and size of the grains vary not a little, some being roundish, and some elongated; maize is the largest; many of the millets are very small. The plants themselves vary in size

almost as much as their seeds, the millets being the smallest, and maize the largest of ordinary corn-plants.—Buckwheat and spurry are sometimes ranked with the C., but incorrectly, if the term is regarded as having any botanical limits, for they are not grasses; but their seeds are used in the same way. The quinoa of South America, and the kiery (*amaranthus*) of India, with other plants of different orders, might be added to the list on the same account; even the lotus of the Nile, the *Victoria regia*, and other species of water-lilies might thus be reckoned as cereal plants. The most extensively cultivated grains are wheat (*triticum*), barley (*hordeum*), rye (*secale*), oats (*avena*), rice (*oryza*), maize or Indian corn (*zea*), different kinds of millet (*setaria*, *panicum*, *paspalum*, *pennisetum*, and *penicillaria*), and durra or Guinea corn (*sorghum* or *andropogon*). These have all been cultivated from time immemorial, and there is great uncertainty as to the number of species to which the many existing varieties belong; their original forms and native countries cannot confidently be determined. Barley, oats, and rye are the grains of the coldest regions, the cultivation of the two former extending even within the arctic circle. Wheat is next to these, and in the warmer regions of the temperate zone its cultivation is associated with that of maize and rice, which are extensively cultivated within the tropics. The millets belong to warm climates, and durra is tropical or sub-tropical. Rice is the food of a greater number of the human race than any other kind of grain. Maize has the greatest range of temperature.—Besides these, other grasses are cultivated to some extent, in different parts of the world, for the grain they yield.

CEREBELLUM. See **CEREBRUM**.

CEREBRATION, UNCONSCIOUS, is the non-voluntary working out and reproduction of ideas under certain nerve conditions. There can be no doubt that molecular changes in the cerebrum accompany all our conscious mental processes. The doctrine of unconscious cerebration, as stated by Dr. Wm. B. Carpenter (q.v.), Laycock (q.v.), and others, holds that similar changes may go on in the cerebrum without any consciousness on our part, until the fully elaborated mental result is presented. It is an every-day experience that after one has been in vain trying to recall some name or incident, it will suddenly flash into the mind when one is thinking of some entirely different subject. According to Carpenter, the cerebrum, put in action by our consciousness, has gone on working automatically but unconsciously, until the processes accompanying the mental operation of remembering the name or incident have been completed. This is the physiological statement corresponding to the psychological doctrine that the mind may undergo modifications without being conscious of the process until the new combination is presented to consciousness.

CEREBRINE, or **CEREBRIC ACID**, is an organic acid of very complex composition, found in the liver, blood, and nerves, but especially the brain of animals.

CEREBRO-SPINAL FLUID. There is an interval, termed the *sub-arachnoid space*, lying between the two innermost of the membranes of the brain and spinal cord—viz., the arachnoid and the pia mater. This space, which is narrow on the surface of the cerebral hemispheres, but is comparatively wide at the base of the brain between the two middle lobes of the cerebrum, and, posteriorly, between the hemispheres of the cerebellum and the medulla oblongata, is occupied by the cerebro-spinal fluid, which fills up the interval between the arachnoid and pia mater, and keeps the opposed surfaces of the former membrane (which is a closed serous sac) in contact. The cerebro-spinal fluid is a clear, limpid, slightly albuminous fluid, having a saltish taste, and a faintly alkaline reaction, and not containing more than 1.5 per cent of solid matters. It varies in quantity from 2 to 10 ozs., and is said to be most abundant in aged persons. Its chief use is to afford mechanical protection to the nervous centers.

CEREBRO-SPINAL MENINGITIS. See **MENINGITIS**.

CEREBRUM—CEREBELLUM. Cerebrum (Lat. the brain) is sometimes applied to the whole contents of the cranium or skull; but more usually it denotes the upper portion, while the under and posterior portion is called the **CEREBELLUM**, or little brain. In this article we shall briefly notice the chief results which have as yet been obtained regarding the uses of the various parts of the mass, referring to the article **BRAIN** for the necessary anatomical details.

The *crura cerebri* appear as the principal conductors of impressions to and from the cerebrum. When one is divided, the animal moves round and round, from the injured towards the sound side, as if from a partial paralysis of the latter side. The effect may be referred to the interruption of the voluntary impulses from the C., for although the cerebellum seems to have the office of combining the muscles, whose co-operation is necessary for each action, the effort of the will must proceed from the cerebrum.

The *corpora quadrigemina* are, as stated in the article **BRAIN**, “analogues of the optic ganglia of the lower animals.” Their removal wholly destroys the power of seeing, and diseases by which they are seriously affected are usually accompanied with blindness. Disease or destruction of one *corpus quad.* produces blindness of the opposite eye. Probably their connection with vision is not their only function.

The *optic thalami* probably participate slightly in the visual function of the *corpora quadrigemina*; but we have no definite evidence on this point. They are intimately connected with the power of movement. Destruction of one of them causes rotation of the animal, similarly to division of one of the *crura cerebri*. Longet has shown, that

after removing all the cerebral hemispheres and the *corpora striata*, the animal can still stand and walk, but that on removing one of the optic thalami, it falls down paralyzed on the opposite side, or commences rotatory motion.

The function of the *corpora striata* is very uncertain; they have probably some connection with sensation and volition, the precise nature of which is at present unknown.

The parts hitherto considered—including the cerebellum—appear to comprise the apparatus (1.) For the direction and government of all the unfelt and involuntary movements of the parts which they supply; (2.) For the perception of sensations; and (3.) For the direction of such instinctive and habitual movements as do not require the exercise of any reasoning or intellectual act. They cannot be regarded as organs of the higher faculties of the mind.

The functions of the *cerebral hemispheres* are, in the words of Dr. Kirkes (*Handbook of Physiology*), those of organs by which the mind, 1st, perceives those clear and more impressive sensations which it can retain and judge according to; 2d, performs those acts of will, each of which requires a deliberate, however quick, determination; 3d, retains impressions of sensible things, and reproduces them in subjective sensations and ideas; 4th, manifests itself in its higher and peculiarly human emotions and feelings, and in its faculties of judgment, understanding, memory, reflection, induction, and imagination, and others of the like class.

"The evidences that the cerebral hemispheres are, in the sense and degree indicated above, the organs of the mind, are chiefly these: 1. That any severe injury of them, such as a general concussion, of sudden pressure by apoplexy, may instantly deprive a man of all power of manifesting externally any mental faculty; 2. That in the same general proportion as the higher mental faculties are developed in the vertebrate animals, and in man at different ages, the more is the size of the cerebral hemispheres developed in comparison with the rest of the cerebro-spinal system; 3. That no other part of the nervous system bears a corresponding proportion to the development of the mental faculties; 4. That congenital and other morbid defects of the cerebral hemispheres are, in general, accompanied with corresponding deficiency in the range or power of the intellectual faculties and the higher instincts." See MIND, THE HUMAN.

Cerebellum.—The functions of this organ have been made the subject of much discussion and investigation. It is itself insensible to irritation, and has been cut away in various animals (by Longet and other French physiologists), without eliciting signs of pain; moreover its removal or disorganization by disease is generally unaccompanied with loss or disorder of sensibility, animals from whom it has been removed being apparently able to smell, see, hear, and feel, as perfectly as before. Flourens seems by his vivisections to have arrived at the correct view regarding the functions of this organ, and his results have been fully confirmed by Longet and others. He extirpated the C. in birds by successive layers. Feebleness and want of harmony of the movements resulted from the removal of the superficial layers; when he reached the middle layers, the animals became restless; their movements were violent and irregular; but they were not convulsed, and their sight and hearing were perfect. By the time that the organ was entirely removed, the animals had completely lost the power of flying, walking, standing, and preserving their equilibrium. When a pigeon in this state was laid upon its back, it could not recover its former position; but fluttered its wings, and saw and tried to avoid a threatened blow. Hence volition, sensation, and memory were not lost, but merely the faculty of combining the actions of the muscles. From a large series of experiments of this kind, subsequently made on all classes of animals, Flourens infers that the C. belongs neither to the sensitive nor to the intellectual apparatus; and that it is not the source of voluntary movements, although it belongs to the motor apparatus; but that it is the organ for the co-ordination of the voluntary movements, or for the excitement of the combined and harmonious action of the muscles.

This view is confirmed by the phenomena observed in certain cases of disease, and to a certain extent by comparative anatomy, for to each of the four classes of vertebrata—if we reckon amphibians and reptiles as a single class—the species whose natural movements require the most rapid and exact combinations of muscular actions are those in which the C. is most developed in proportion to the spinal cord; and if we compare different species of the same class, we usually find the development of the C. to correspond very closely with the perfection and variety of the muscular movements. For example, in the frog the movements are exceedingly simple in character, consisting of little else than flexion and extension of the posterior limbs; and the C. of this animal is extremely small compared with the rest of the brain, being merely a thin narrow band of nervous matter. In the common sea-turtles, the movements of the body are of a more varied character, and the motions of the head and neck are more extensive; and here we have a much more highly developed cerebellum. In the alligator, again, a reptile whose motions closely resemble those of quadrepeds, the C. is still more fully developed.

The influence of each half of the C. is directed to the muscles of the opposite side of the body, and for the right ordering of the movements, the actions of its two halves must be mutually balanced and adjusted; for if the nervous structures uniting one of the halves of the C. with the medulla oblongata and spinal cord be divided, strangely disordered movements occur, the animal falling down on the side opposite to that which

CEREMONIES.—1, 3. Sacraments of the Roman Catholic Church (15th century). 2. Bishop's stick (15th century); crucifix (12th century); ciborium (13th century). 6. Protestant. 8. Thurible (12th century); holy water vessel (11th century). 9. Russian baptismal

s mitre (1500); bishop's rings (14th century). 4. Death-watch. 5. Processional candle-
 communion service (16th century). 7. Baptism of the Reformed Church (18th century).
 ceremony.

has been injured, and continually rotating round the long axis of its body, sometimes for several days, at the rate of fifty or sixty times in a minute. Similar movements have been observed in men in whom one of the crura of the C. has been diseased.

Phrenologists are of opinion, in accordance with the view originally propounded by Gall, that the C. is the seat of the sexual impulse and instincts; but this view has been long abandoned by almost all physiologists, for the reason that it has not been found to be sufficiently supported by anatomical and experimental facts, many of which are indeed directly opposed to it.

Our limited space compels us to leave altogether untouched many most interesting topics in cerebral physiology, as, for instance, the quality of the brain, the plurality of the cerebral organs, etc. The reader who wishes for further information, is referred to Ferrier, *Functions of the Brain* (1886), Ross, *Diseases of the Nervous System* (1883), and a number of interesting papers in *Philosophical Transactions* (1886-87). See also the article BRAIN.

CEREMONY (Fr. *cérémonie*; Lat. *cærimonia*, a sacred rite). Almost any act, when performed in a regular, orderly, and formal manner, and when viewed, not with reference to its object, but the mode of its performance, becomes a C.; and the more entirely the attention of the performers is withdrawn from the object of the act, and fixed upon the manner of its performance, the more *ceremonious* does it become. The purely formal character of C. is thus illustrated by Hooker: "The name ceremony," he says, "we do not use in so large a meaning as to bring sacraments within the compass and reach thereof, although things belonging to the outward form and seemly administration of them are contained in that name." The remark is applicable to the most trivial ceremonies of social life and of state pageantry, as well as to the most sacred rites of religion, for a C. which is its own object would scarcely be entitled to be regarded even as a ceremony. The most empty display has always the ulterior object of imposing on somebody.

Ceremonies may be divided into four classes: 1. Religious ceremonies; 2. Social ceremonies; 3. State ceremonies; 4. International ceremonies.

Religious and state ceremonies will be treated of respectively under their various denominations; see, for the first, LITURGY; MASS; PROCESSIONS; RITE; RITES, etc.; for the second, CORONATION; COURT; COURT, PRESENTATION AT; PARLIAMENT, etc. Social C. will in a great measure fall under the heads COURTESY; ETQUETTE; FORMS OF ADDRESS; PRECEDENCE, etc.; and international C. under AMBASSADOR; CONSUL; DIPLOMACY, etc.

CEREOP SIS (Gr. wax-face), a genus of birds of the family *anatidæ*, to which the New Holland goose (*C. Novæ Hollandiæ*) belongs. This bird has been known since the southern shores of that country were first visited by navigators. There, and on the adjacent islands, it is found in great abundance; and the earlier navigators easily supplied themselves with fresh provisions by knocking them down with sticks, so little were they acquainted with the danger to be apprehended from man. The cere is remarkably large, whence the name.

CERÉS, among the Greeks named *Dēmēter*, daughter of *Chronos* (Saturn), by *Rhea* (Ops), sister of Jupiter, Neptune, Juno, etc. She had the misfortune, along with her other brothers and sister, to be devoured by her father, who, however, vomited her forth again after taking the emetic which Metis gave him. By her brother Jupiter she became the mother of Persephone or Proserpina (q.v.). The chief myth relating to C. tells how her daughter Proserpina was stolen by Pluto, and how the mother wandered far in quest of the maiden. After traveling in human form nine days, and everywhere distributing her gifts to mankind, she excited the pity of Jupiter, by whom Mercury was dispatched to bring back Proserpina from the infernal world, but on the condition that she must spend there a third part (or, as others say, one half) of every year. The myth of C. was symbolical of the growth of grain; some consider that this is intimated in the name Demeter, which is thought to be equivalent to *ge meter*, "Mother Earth." The relations of the worship of C. with agriculture, social order, etc., were expressed in her two great festivals—the *Eleusinia* and the *Thesmophoria* (q.v.). C. was especially worshiped in Crete, Delos, Sicily, Asia Minor, Arcadia, Argolis, and Attica. Bulls, cows, pigs, honey-cakes, and fruits were offered to her. Among the Romans, her festivals were styled CEREALIA; and of these, the most interesting was the feast celebrated by the rural population shortly before harvest, when the country people, dressed in white, and crowned with oak-leaves, danced and sang harvest songs in honor of the goddess. The feast in April lasted several days, and was celebrated by games of the circus. C. was represented, most commonly, in a chariot drawn by dragons, having her head crowned with a garland of corn-ears, and holding a torch, a basket, or a poppy in her hand. See *illus.*, MYTHOLOGY, vol. X.: and ELEUSINIAN MYSTERIES.

CERES, one of the planetoids (q.v.), and the first of them that was discovered. It was first seen by Piazzi at Palermo, Jan. 1, 1801. He continued to observe its motion till the 13th of Feb., when illness obliged him to discontinue his observations, which, however, sufficed to enable astronomers approximately to calculate its orbit. It was nearly a year after before it again became visible, owing to its approach to the sun.

C.'s magnitude is less than that of the moon; and it looks like a star between the seventh and eighth magnitudes.

CEREUS, a genus of plants of the natural order *cactææ* (q.v.), containing about 100 known species, among which are some of the most splendid flowers of that order. One of these is *C. speciosissimus*, one of the most common greenhouse plants in the U. S., and sometimes cultivated even in windows. Its large flowers are of a fine scarlet color, the inner petals with a violet tinge: they spring singly from the younger branches. The fruit, when well ripened, is of a delicious flavor. The plant is a native of Mexico.

CERIGNOLA, a t. of Italy, in the province of Foggia, 23 m. s.e. of Foggia. It is divided into two parts—the old and new town, in the former of which a portion of the ancient walls still remain—and is celebrated for the decisive victory obtained over the French by the Spaniards in 1503, and which established the supremacy of Spain in Naples. C. has manufactures of linen, and a trade in cotton and fruits. Pop. about 26,000.

CERİGO, one of the smaller of the seven Ionian islands, was anciently called Cythera; is situated in the Mediterranean, and is separated from the coast of Morea by a narrow strait; lat. 36° 28' n., long. 23° e. It has an area of 107 sq. m., with a pop. in 1889 of 5015. With the exception of a few tracts of land, it is a very barren, dry, and mountainous island. In some parts, however, corn, wine, and olive-oil are raised. There are two great caverns in the island—one in the sea-cliff at the termination of the wild glen of Milopotamos; the other known by the name of the cavern of St. Sophia, from a small chapel at its mouth dedicated to this saint, is situated at about one and a half hours' ride from Capsali, the capital of the island. The former cavern is said to be 3 m. in length, and so low that it is necessary to creep, in many places, on hands and knees to explore it. The latter—that of St. Sophia—is a very remarkable one, and possesses singular beauty; it abounds in enormous stalactites of various shapes and great beauty. In ancient times, C. was sacred to Venus, being, according to the old mythology, the island that received this goddess when she arose from the sea.

CERINTHUS (abusively named MERINTHUS, i.e., a halter), a heretic who lived at the close of the apostolic age, but of whom we have nothing better than uncertain and confused accounts. It is said that he was a Jew by birth, and studied philosophy in Alexandria. From Egypt he passed into Asia Minor, and lived in Ephesus contemporaneously (according to the belief of the church) with the aged apostle John. Tradition tells us that John held the heretic in such detestation, that, on a certain occasion, when he encountered C. in the baths of Ephesus, he immediately left the place, saying to those about him: "Let us flee home, lest the bath should fall while Cerinthus is within." It was believed in the ancient church, that the gospel of St. John was written in opposition to the tenets of C.; and the Roman presbyter Caius (about the close of the 2d c.) supposed that C. had revenged himself by falsely ascribing the authorship of the Apocalypse to St. John—it being in reality his own work! The fathers contradict one another in their accounts of Cerinthus. Some describe him as a complete Gnostic, in which case he would be the earliest recorded teacher of that sect; others say that he held coarse and sensual millenarian views, making the *millennium* (q.v.), with the licentious fancy of an Arab, consist chiefly in "nuptial delights," and that he believed the Jewish ceremonial law to be in part binding upon Christians. There can be no doubt that C. made use of the Jewish law at least as a symbol for his Gnostic doctrines, and also employed millenarian terms in a symbolical manner; a very natural thing for him to do, on the hypothesis which Neander and others have suggested—that Gnosticism originated, not among the minds which had received a true Hellenic culture, but among the Judaizing sects, whose theosophy was a jumble of the spiritual and the material. C. being the oldest teacher of Judaico-Gnostic principles, there would naturally be a greater incongruity and want of harmony in his language and ideas than characterized Gnosticism at a later period of its development; and subsequent ecclesiastical writers, destitute as all of them were of precise historical knowledge and sound principles of criticism, could hardly avoid misunderstanding a system which is not consistent throughout, but bears evident marks of being formed in a transition epoch.—Paulus *Historia Cerinthi* (Jena, 1799); Neander, *Kirchengeschichte*, vol. i., part 2.

CERITE, or O'CHRÖTE, is the *silicate of cerium*. It is found as a mineral in gneiss, at Westmanland, Redderhyttan, and Bastnäs. It contains in 100 parts—silica, 16, peroxide of cerium, 26.55; oxide of lanthanum, 33.38; carbonic acid, 4.62; alumina, 1.68; peroxide of iron, 3.53; lime, 3.56; oxide of manganese, 0.27; and water, 9.1. It occurs in granular pieces of a clove-brown, cherry-red, or gray color, with a white streak, a splintery fracture, an adamantine luster, and is translucent at the edges.

CERITHIUM, a genus and the type of a family, *cerithiadae*, of gasteropodous mollusca of the order *pectinibranchiata* of Cuvier. The shell is spiral, elongated, and many-whirled, with an oval oblique aperture, which has a short canal in front. The species of this family are numerous, most of them marine, but many inhabiting estuaries and brackish rather than salt water; some are found in lakes and rivers. A few belong to temperate climates, but most of them are tropical, and in mangrove swamps they par-

ticularly abound. The fossil species are very numerous, almost all limited to the tertiary formations. See BAGSHOT BEDS. See illus., TERTIARY PERIOD, vol. XIV.

CERIUM, is a rare metal found native in cerite (q. v.) and a few other minerals. It is a white metal, has not been obtained in any quantity, is not therefore employed in any manufacture, and forms two oxides and a numerous class of salts.

CERNUSCHI, ENRICO, 1821-96; b. Milan, Italy, took part in the revolution of 1848-49; was an ardent republican, and assisted Garibaldi in the defense of Rome. He went to France in 1850 and engaged in banking business; became one of the chief stockholders of *Le Siècle*, in which he discussed economical questions with great ability, opposing the Socialists. This course exposed him to the risk of being shot, first, by the Communists, and, upon their suppression, by a Bonapartist general. Disgusted, he left France and visited Egypt, China, and Japan, collecting and bringing back so many valuable works of art as to make his residence in Paris a veritable museum; returned to Paris in 1873; in 1876 visited England; and in 1877 the United States, where he delivered several addresses on economical questions. He published *Réponse à une accusation portée par M. de Cavour* (1861); *Mécanique de l'échange* (1865); *Contre le billet de Banque, dépositions et notes* (1866); *Illusions des Sociétés co-opératives* (1866); *Discours* (1871); *Or et argent* (1874); *La Question monétaire en Allemagne* (1875); *Silber vindicated* (1876); *M. Michel Chevalier et le bimétallisme* (1876); *Le Bland bill* (1878); *Les Projets monétaires de M. Say* (1879); *Le Bimétallisme à 15½ nécessaire* (1881).

CEROGRAPHY (Greek *keros*, wax; *grapho*, I write), is the art of engraving on a copper plate covered with wax, from which a stereotype plate is taken.

CEROPLAS TIC (Lat. *cera*, wax), the art of modeling in wax. See WAX-WORK.

CEROSTRO TUM, or CESTRO'TUM (Lat.), a species of encaustic painting upon horn or ivory, the lines of the design being burned in with the *cestrum* or burning needle, and wax introduced in the furrows thus made.

CEROX'YLOX. See WAX PALM.

CERR'ETO, a t. of South Italy, in the province of Benevento, situated on a slope of the Apennines, about 22 m. n.e. of Capua. It is a well-built town, with a cathedral, and manufactures of coarse cloth. The district produces good wine. Pop. 6000.

CERRO DE PASCO, or PASCO. See CERRO GORDO.

CERRO GORDO, a mountain pass on the national road from Vera Cruz to the city of Mexico. April 18, 1847, Gen. Scott, with a United States force of 8500, defeated Santa Anna, the Mexican leader, with 12,000 men, at this place. The Mexican loss was from 1000 to 1200 killed and wounded and 3000 prisoners; that of the other side, 63 killed and 368 wounded.

CERRO GORDO, a city of Peru, the capital of the province of Pasco, in the department of Junin. It is in the vicinity of the richest silver mines in the republic; and, standing at an elevation of 14,100 ft., it has, all the year round, the temperature of an English winter. The population is estimated at about 14,000. C. G. is 140 m. to the n.e. of Lima.

CERRO GORDO, a co. in n. Iowa, intersected both e. and w., and n. and s. by railroads, and watered by Shell Rock river, Lime Creek and the headwaters of Beaver Dam river; 576sq.m.; pop. '90, 14,864. It is an agricultural region. Co. seat, Mason City.

CERRO GORDO DE POTOSÍ, a mountain in Bolivia, directly s.w. of Potosi, containing very rich silver mines. The summit is 16,150 ft. above sea level.

CERTALDO, a market t. of central Italy, is picturesquely situated on the Elsa, about 18 m. s.w. of Florence. It is noteworthy as the residence of Boccaccio, as well as the scene of his death. His house, surmounted with a tower, is still standing, and contains the articles of furniture belonging to the poet's time, and a fresco painting of him by Benvenuto Cellini. Pop. 7,500.

CERTHI'ADE, a family of birds, generally placed in the great order *insector*es or *passerine*, and tribe *temnirostr*es, although some naturalists have ranked them in the order *scansores*. They mostly live on the trunks and branches of trees, feeding on insects which they find in the crevices of the bark; and many of them aid themselves by their stiff tail-feathers in retaining their position as they search for their food on the perpendicular stem. Their claws are long and sharp; the hind-toe is also elongated, so that they can take firm hold of the bark or of a small branch; and many of them can pass round a horizontal branch, clinging to its under-surface with their backs to the ground. The bill of many is slender and curved; others, however, have a comparatively short and straight bill. The tongue is cartilaginous at the extremity, and so fitted to aid in seizing insect prey. The plumage is usually dull and uniform; but the birds are lively and active in their habits. The species are numerous and widely diffused; they are divided into a number of genera. All of them are small birds.

CERTIFICATE, a written testimony to the truth of a certain fact or facts. The law of England recognizes certificates for various purposes. 1. Annual C. of attorneys. See ATTORNEY. 2. C. of appointment of the creditors' assignees to a bankrupt's estate and effects. 3. C. of conformity of a bankrupt. 4. C. of counsel, to enable a pauper to litigate *in formâ pauperis*. 5. C. of the judges of the superior common-law courts at

Westminster, which are of various kinds and for various purposes. 6. C. of registry of a ship; which is a copy of what is entered in the registry of the ship in the books of the custom-house. This C. is granted by the collector, comptroller, or principal officer of the customs at the port of registry, and delivered to the captain as a voucher of the character and privileges of the vessel as an American ship.

CERTIFIED COPY. See EVIDENCE.

CERTIORARI (Latin, to be certiorated, or more accurately and fully informed of), is a writ issued by a superior to an inferior court or to a body acting in a judicial capacity, such as commissioners, magistrates, assessors of taxes, etc. It requires some proceeding pending in the lower court, or the record of some cause terminated where the proceedings were not in accordance with the course of common law, to be sent to the superior court for the purpose of reviewing the same or of removing it before trial and judgment, and is employed both in civil and criminal cases. When used as a means of review of an actual decision it deals with questions of law rather than with those of fact. As, for example, if a board of assessors of taxes should decide that the property of a bank invested in United States bonds could be taxed under the authority of the State, they would have decided a question of law which might, by means of a writ of certiorari, be re-opened before superior tribunals and ultimately before the supreme court. The writ is granted or refused at the discretion of the superior court, and the usual result is that the proceedings below are either quenched or affirmed.

In England, it issues in civil cases, out of the chancery division of the high court of justice, and in criminal, from the queen's bench division of the same court. It is now chiefly used in the latter division, and is the usual mode of correcting excesses of justices of the peace in miscellaneous matters.

CERTO'SA DI PAVIA, LA, one of the most celebrated monasteries in the world, situated in the neighborhood of Pavia, and founded, 1396, by Giovanni Galeazzo Visconti, first duke of Milan, to appease his conscience for the murder of his uncle. The church is a splendid structure in the form of a Latin cross, the ground-plan being 249 ft. long by 173 ft. broad. It has altogether 12 chapels, 7 in the whole length of the church, and 5 in the transept, some of which are decorated with fine frescoes and paintings. The richly sculptured façade, designed by Ambrogio da Fossano, named Borgognone, was commenced in 1473. The building is made up of various styles, but the pointed prevails in the interior, which is decorated with frescoes, paintings, etc., by Dan Crespi, Andrea Solari, Campi, and Ambrogio Fossano, and contains a gorgeous high-altar, the mausoleum of the founder, and several monuments.

CERU MEN. This term is applied to yellow waxy matter which is secreted by certain glands lying in the external auditory canal, or the passage that leads from the external opening of the ear to the membrane of the tympanum. Its main use, doubtless, is to lubricate this passage. It possesses a peculiarly bitter taste, and some physiologists have believed that in consequence of this property it prevents insects from entering the auditory canal. It is popularly known as ear-wax.

CERUSE, or WHITE-LEAD, the basis of white oil-paint, is a *carbonate of lead*. It has several other names—krems, Nottingham white, flake-white, etc. Like all other preparations of lead, C. is liable to be acted upon by exhalations from sewers, or by anything which contains sulphuretted hydrogen, in which case it is changed to a dull and leaden hue. Neither will it bear to be mixed with any pigment containing sulphur, such as vermilion. It is supposed that the white oxide of zinc might be substituted for C. as a white pigment with advantage.

CERUTTI, GIUSEPPE ANTOINE JOACHIM, 1738-92; a Jesuit and professor in the college of that order in Lyons. Among his works are an *Apology for the Institute of the Jesuits*; a *Memoir of the People of France*; a poem entitled *The Garden of Biets*. He also edited a weekly journal, and was once elected to the legislative assembly.

CERVANTES SAAVEDRA, MIGUEL DE, one of the greatest imaginative writers of Spain, was b. of an old Galician family, at Alcalá de Henares, Oct. 9, 1547. He studied at Salamanca, and afterwards at Madrid, where he was placed under the care of a learned theologian, Juan Lopez de Hoyos, who was then professor of belles-lettres in the university. But his natural love of poetry led him to spend most of his time in writing elegies, ballads, sonnets, and a pastoral romance entitled *Filena*. When 22 years old, C. served for some time as valet-de-chambre to cardinal Giulio Aquaviva of Rome. In 1570, he served as a volunteer under the command of the papal admiral, Marco Antonio Colonna, and fought gallantly against the Turks. At the battle of Lepanto, he was maimed for life by a gunshot wound in the left hand. He afterwards took part in various campaigns. Captured by an Algerine squadron, he was made a slave, but was ransomed in 1580, after a four years' captivity. On his return to Spain, he rejoined his regiment in the army sent by Philip II. to support his claims in Portugal, and distinguished himself in the expedition to the Azores. In 1584, he returned to Spain, and retired into private life, to devote his attention to literature. Soon after his publication of the pastoral romance, *Galatea* (1584), he married, commenced writing for the stage, and produced, in the course of a few years, as many as 30 dramatic pieces, of which the tragedy *Numancia* is the most remarkable. During the years 1588-99, he lived in straitened circumstances in Seville. In 1605, he once more appeared as an author, and now

in a sphere exactly suited to his genius. In his immortal work, *Don Quixote*, said to have been written in prison, C. satirized the prevailing taste for extravagant romances of chivalry. The first part of this great satirical work appeared in Madrid, and was received at first coolly, but soon afterwards with loud applause, which, at a later period, was echoed from all parts of educated Europe. *Don Quixote*, though written with a satirical purpose, is throughout pervaded by the true spirit of poetry. With that universality which belongs to the highest genius, C. connected a universal human interest with descriptions of local and temporary characteristics. He did not intend by his *Don Quixote* to burlesque the old Spanish knight-errantry, for, as Mr. Ford remarks (see *Handbook of Spain*, part i., p. 238), "the thing had expired a century before his birth;" but to put an end to the absurd and affected romances which it was then the fashion to read, and which were believed to be true pictures of chivalry. He had also, it is quite clear, another object in view—viz., to show that the deeper and truer and more guileless a nature is, the more will it become the jest and butt of real life; but he likewise teaches us that the pure heart and the high soul obtain a triumph which misfortunes and blunders cannot tarnish; for the knight always "disinterested, generous, elevated, and beneficent," though "the sweet bells of his intellect are jangled and out of tune," maintains throughout a firm hold on our affections and esteem. Charles Lamb has truly said, that readers who see nothing more than a burlesque in *Don Quixote*, have but a shallow appreciation of the work.

Though received with enthusiasm, *Don Quixote* brought no pecuniary reward to the author. He was left in the obscurity and poverty in which he had passed so many years, and vainly endeavored to improve his circumstances. After silence during several years, C. published his twelve *Novelas Ejemplares* (Exemplary Tales), 1613; his *Viage al Parnaso* (Journey to Parnassus), 1614—his next best production to *Don Quixote*; and in the following year he produced eight new dramas, but these were indifferently received. In 1614, a certain Alonso Fernandez de Avellaneda published at Tarragona a so-called continuation of *Don Quixote*, which was made a vehicle of abuse lavished on Cervantes. It appears that C. suffered considerably under these despicable attacks; but he revenged himself in noble style by publishing (1615) the true continuation of *Don Quixote*. Near the close of his career, C. found a patron in the count of Lemos, who relieved his poverty. During the last few years of his life, he resided in Madrid, where he died, April 23, 1616. No stone marks the spot where his remains were interred. His novel, *The Sorrows of Persiles and Sigismunda*, was posthumously published. In 1835, when the house in which the poet had lived in Madrid was rebuilt, a bust of C., by the sculptor Don Antonio Solá, was placed in the front.

Among the several editions of *Don Quixote*, we may mention the splendid one in 4 vols. (Madrid, 1780); that by Pellicer (5 vols., Madrid, 1798); the fourth published by the Madrid Academy, with an admirable life of C. by Navarrete (5 vols., Madrid, 1819); Diego Clemencin's edition, with the most complete commentary (6 vols., Madrid, 1833-39); and a good pocket-edition, published at Leipsic (6 vols., 1800-7). There is but one complete edition of Cervantes' works, that of Rivadeneyra in twelve large volumes (Madrid, 1863-64). The original edition of *Don Quixote* has been reproduced by photography (2 vols. Barcelona, 1871-74). There are altogether one hundred and fifty editions of this novel in the original, and more than three hundred editions in other languages. There exist translations of it in fourteen languages, the last in English being that of Watts (1888). There are nine versions in French, besides numerous abridgments; thirteen in German, the best being that of Braunfels (1884); ten in Russian, including abridgments and translations from the French, and three in Italian, besides single translations into Dutch, Danish, Polish, Portuguese, Swedish, Hungarian, Bohemian, Servian, and modern Greek. Besides the life of Cervantes by Navarrete, mentioned above, there is also a good one by Moran, attached to the *édition de luxe* of *Don Quixote*, published in three quarto volumes at Madrid (1863). Of the collected works of C., an edition, not containing the comedies, appeared at Madrid (16 vols., 1803-5); and another, without the *Journey to Parnassus*, was published in the same city (11 vols., 1829). Don Aug. Garcia de Arrieta published a selection from the works of C. (10 vols., Paris, 1826-32); and a reprint of the collected works is included in Baudry's *Colección de los Mejores Autores Españoles* (Paris, 1840-41). England has been fertile in translations of C.'s immortal work. The first is that of Thomas Skelton (1612-20), in addition to which may be mentioned those of Philips, Motteux, Smollett, Dufey, Jarvis, Wilmot, and Clark. The best are those of Skelton, Jarvis, and Clark, and of Duffield (1881), Ormsby (1885), and Watts (1888-90). See Navarrete's *Vida de Miguel Cervantes Saavedra* (1819).

CERVERA, a t. of Spain, in the province of Barcelona, 28 m. e. of the city of Lerida. It is situated on an eminence, is surrounded by old walls pierced with nine gates, and the west approach is commanded by a castle, which is now in a ruinous condition. The university of Lerida was removed here by Philip V., but it was afterwards transferred to Barcelona. The university building, a massive but unsightly edifice, is still standing. C. has manufactures of linen, woolen, and cotton fabrics. Pop. 4200.

CERVETERÉ, or CERVET'RI, is a village on the site of the ancient Cære, in s. Etruria, near the Tyrrhenian sea, in the district of Civita Vecchia, 32 m. from Rome. It afforded refuge to the Tarquins after their expulsion from Rome, and was by the

Romans chosen as the safest hiding-place of their treasures during the occupation of the capital by the Gauls. The old city thenceforward declined, and in 1250 was deserted by a large portion of its inhabitants, who removed to the present village of Ceri. From the fact that the old inhabitants were admitted to Roman citizenship without the right of suffrage, the "Cærite franchise" came to be a proverbial expression denoting disfranchisement. Many interesting Etruscan remains have been found in the tombs of the city. One of the sepulchres belonged to the Tarquin family. See *illus.*, ARCHITECTURE, vol. I.

CERVIA, a t. of central Italy, situated on the Adriatic, 13 m. s.s.e. of Ravenna. It is regularly built, has a cathedral and several convents; and from a marsh in the neighborhood many tons of salt are annually obtained.

CERVIDÆ AND CERVUS. See DEER.

CERVIN, MONT (Ger. *Matterhorn*; Ital. *Monte Silvio*), a mountain of the Pennine Alps, about 40 m. e.n.e. of Mont Blanc, and between the Valais in Switzerland and the Val d'Aosta in Piedmont. Above an unbroken glacier line of 11,000 ft. high, it rises in an inaccessible obelisk of rock, more than 3000 ft. higher, and is described by the late prof. Forbes as the most striking natural object he had ever seen. The total elevation of the mountain is 14,836 feet. The Col of Mont C., used as a passage for horses and mules in summer, has an elevation of 10,938 feet. See MATTERHORN.

CERVINARA, a t. of Italy, in the province of Avellino, 12 m. n.w. of Avellino. It has a convent and several churches, and a trade in the produce of the district. Pop. about 8000.

CESARI, GIUSEPPE (sometimes called GIUSEPPINO, or IL CAVALIERE D'ARFINO), an Italian painter, was b. at Rome, 1570, and d. there in 1640 (or 1642). He was greatly honored by no less than five popes, and his paintings were always highly popular. His works—in fresco and oil—display lively imagination, gay coloring, and great tact in execution; but are deficient in natural simplicity, correctness of design, symmetry of arrangement, and dignity of style. As he was the most brilliant of the mannerists, he was the chief object of the attacks made by the artistic reformers, Caravaggio, the Caracci, and their followers—who constituted the *naturalisti*—on the conventional or pseudo-idealistic style of painting.

CESAROTTI, MELCHIORE, an excellent Italian poet, was b. at Padua, 15th May, 1730, and d. 3d Nov., 1808. He gained a reputation by the vigor and originality of his style, especially in his translation of Macpherson's *Ossian* (2 vols., Padua, 1763). The versification of this work, like that of C.'s free translation of the *Iliad*, under the title of *La Morte di Ettore*, was admired by Alfieri. C. unquestionably threw fresh life into Italian literature, but few in this country will consider his enthusiasm very rational, when it could induce him to think poor Macpherson a better poet than Homer. C.'s best work was his *Saggio sulla Filosofia delle Lingue* (Padua, 1785), written in opposition to the academical pedantry of La Crusca. His prose style is vigorous, but full of innovations, especially Gallicisms.

CESAROVITCH. See CZAR.

CESENA, a t. of central Italy, about 12 m. s.e. of Forlì, on the Emilian Way. It is pleasantly situated on a hill-slope, washed by the Savio. Its principal buildings are the *Palazzo Pubblico*, the Capuchin church, and the library founded by Domenico Malatesta Novello, in 1452, with a rich collection of MSS. There are many monasteries and nunneries, as befits a place that gave birth to two popes—Pius VI. and VII. It has some silk factories, with a trade in wine and silk; and in the vicinity are productive sulphur-mines. Pop. about 37,000.

CESNO LA, LUIGI PALMA DI, LL.D., Count, b. in Turin, Italy, 1832. When but 15 years old he enlisted in the war against Austria. In 1850, he graduated from the Turin Royal Military Academy, receiving a commission which he surrendered in 1854. In the Crimean war he was a staff officer. He emigrated to New York in 1860, and began teaching languages. The next year he married one of his pupils, a daughter of Commodore Reid, of the U. S. navy. In the war of the rebellion, he was col. of cavalry and participated in many engagements until June, 1863, when he was wounded and made prisoner. He was exchanged not long after, and left the service at the close of the war, with the rank of brig.gen.; at once became an American citizen, and was appointed consul at Cyprus. There he soon interested himself deeply in archaeological researches, and brought to light some of the most valuable remains of ancient Greek art thus far recovered (see ARCHÆOLOGY). In 1878 he gave lectures in New York and elsewhere, and in 1879 was made a director of the Metropolitan Museum of Art, in which his great collection is deposited. He published *Researches and Discoveries in Cyprus* (1878).

CÉSPEDES, CARLOS MANUEL DE, b. in Cuba, 1819; educated in the university at Havana, and admitted to the bar. He traveled in Europe and learned several languages. At Madrid he was concerned with Prim in a conspiracy to overthrow the government, and was compelled to fly. He returned to Cuba and began the practice of law. When Lopez made his revolutionary experiment, C. sympathized with the acts and was

imprisoned. When the revolt of 1868 began he was the leader, and one of his first acts was to liberate the slaves on his sugar estate. On the 10th of Oct., 1868, he proclaimed the independence of Cuba on the field of Yara, and when the republic was formally organized, April 10, 1869, he was elected president. The attempt at revolution was kept up at intervals until 1878. On the 21st of Feb., in that year, the rebellion was officially declared at an end. C. was killed by the Spaniards, 1874.

CÉSPEDES, PABLO DE, 1538-1608; a Spanish theologian, linguist, poet, painter architect, and sculptor; b. at Cordova, and educated at Alcalá de Henares, and in art at Rome. He was a bold and correct draughtsman, a skillful anatomist, and a master of color and composition. His best picture is "The Last Supper," at Cordova. But little of his poetry has been preserved, the most important being fragments of *The Art of Painting*. C. held the office of prebend of the cathedral of Cordova.

CESS, probably a corruption for *assess*, from the Ital. *assessare*, to impose a tax. It has long been used in England as synonymous with the more modern noun *assessment*. Camden, in the time of Elizabeth, speaks of every man being "cessed by the pole, man by man, according to the valuation of their goods and lands." See LAND-TAX.

CESS-POOL. See DRAINAGE, SEWAGE, SANITARY SCIENCE.

CESSIO BONO'RUM (Lat. *cession* or *surrender* of goods), a process which the law of Scotland has borrowed from that of Rome, and which, like many others, is common to it with most of the continental systems. A C. B. may be defined to be an equitable relief from the severity of the earlier laws of imprisonment for debt, granted to a debtor in consideration of a cession of his goods to his creditors. The jurisdiction in cessios formerly belonged exclusively to the court of session, but by 6 and 7 Will. IV. c. 56, it was extended to sheriffs. The principal regulations, with reference to this process, at present in force, are the following: Any debtor in prison, or who has been in prison, or even against whom a warrant of imprisonment has been issued, may apply for a cessio bonorum. In his petition, he sets forth his inability to pay his debts, and his willingness to surrender his estates, and prays for interim protection. This petition must be intimated in the *Gazette*. The bankrupt then lodges with the sheriff-clerk a state of his affairs, subscribed by himself, with all the relative books and papers. On a day appointed for the purpose, he is examined before the sheriff on oath; and if his creditors object to the petition, they are heard, and a proof, if necessary, allowed them. Whatever order the sheriff may pronounce is subject to review by the court of session, or a lord ordinary in vacation. Cessios originating in the court of session are sued out in the form of a summons, by which all the creditors are called as defenders to the action. Any one or more of them may appear; and the pursuer will not be allowed the benefit of the process, till he has satisfied the court that his insolvency has arisen from misfortune, and that his disclosure of the state of his affairs is full and honest. The burden of proving objections to his statements, and to the evidence which he may produce, will be laid on the creditors. If the debtor can provide security to attend all diets when called on, the sheriff or the court of session may grant him liberation or protection whilst the process is pending. A decree of C. B. operates as an assignation of the debtor's movable estate in favor of a trustee for behoof of the creditors. These trustees, like those in sequestrations, are now placed under the supervision of the accountant in bankruptcy. A C. B. differs from a sequestration (q.v.) in this, that it confers no power on the bankrupt to insist on his discharge, and affords no protection against the attachment of his subsequent acquisitions by his creditors. See INSOLVENCY.

CESTIUS, PYRAMID OF, a Roman monument of the Augustan age, situated close to the Porto San Paolo, partly without and partly within the walls of Aurelian. It is known to every English traveler, being in the immediate vicinity of the cemetery where Protestants dying in Rome are buried. The exterior form is perfectly preserved; but of the paintings which formerly decorated the internal walls, only a few traces remain. Several copies of these paintings have been made, of which we may mention those edited by Falconieri, 1661. The pyramid is 125 ft. high, 100 ft. in width at the base; the walls 25 ft. thick. It is built of brick and tufa, faced with slabs of Carrara marble, now perfectly black with age, and rests on a base of travertine 3 ft. high. The interior contains burial chambers of considerable extent. The inner walls are covered with hard stucco, and the roof is vaulted. Both the walls and the roof were covered with paintings of female figures. The memory of the Caius Cestius for whom this pyramid was built has perished, but it has been supposed that he was the Cestius whom Cicero—in the oration *pro Flacco*—mentions as a rich man of business, who, having no children, left a large sum of money for the erection of a monument to himself. Two fluted columns of white marble, now standing before the pyramid of C., with their bases and two other bases, were discovered in the excavations of 1663, at the foot of the pyramid. In the cemetery, the remains of several celebrated men have their resting-place, among whom are the poets Keats and Shelley, Wyatt the sculptor, and Bell the anatomist.

CESTOID WORMS (Lat. *cestus*, a band or throng), a family of *entozoa*, or intestinal worms, of the order *Colelmintka*, consisting of tape-worms and other creatures which resemble them in structure and habits. The number of different kinds of C. W.

is great. Their natural history is important in reference to the health of human beings and of the most valuable domesticated animals; and although the subject is not in all respects an agreeable one, it presents much that is interesting and wonderful. Recent discoveries have given it an entirely new character.

C. W., in their most perfect state, when alone they possess the form from which their name is derived, are in reality compound animals, like many zoophytes and ascidians. They do not, however, like these, subsist by food entering the system through mouths with which the individuals composing it are furnished; for the joints of a cestoid worm, the individuals composing the system or "colony," have no mouth; nor is there any mouth in what is, on various accounts, quite properly regarded as the head, but nutriment is obtained from the surrounding medium by *endosmose* (q.v.); nourishing juices entering everywhere through the skin, as in the spongioles of the roots of plants, into the cellular tissue or *parenchyma* of which the whole body consists. The head of a cestoid worm is furnished with organs—different in different kinds—by which it affixes itself to the inner surface of the intestine of a vertebrate animal. When first it gets into this situation, the body is very short, and has no joints; but they soon begin to appear as transverse striae, and gradually increasing in size, become in most of the kinds very distinct, and at last separate from the system in which they were produced, and are carried away out of the intestines of the animal which contained them. This does not take place, however, till they have not only become mature in the development of the sexual organs—the principal organs to be observed in them—but until they are full of what are called eggs, which, indeed, are rather young ones ready for a separate existence, and each enveloped in a sort of protective shell. Each joint of a cestoid worm is androgynous. Whilst the most matured joints are thrown off from the posterior end, new joints are continually formed, as at first, in the part nearest to the head. The number of joints thus formed from a single individual is very great, as will appear when it is considered that tape worms have been found 20 feet long or upwards, and that these have probably been throwing off joints in large numbers before opportunity has been obtained of measuring them.

As the C. W. have no mouth, so they have no alimentary canal. Some of them, as the true tape-worms, have been supposed to imbibe nourishment by the sucking disks of the head; but these are more probably mere organs of attachment, and the canals which are seen to arise behind them, apparently belong, not to the digestive, but to the vascular system, and are united by transverse vessels or vascular rings in the head and in each of the segments. The only trace of a nervous system hitherto observed is a single ganglion in the head, which in some is seen to send off nerves to the suckers.

The division into segments remains imperfect in some cestoid worms. Those of the genus *ligula*—chiefly found in birds and fishes—resemble a long flat ribbon, not even notched along the edge, and containing a mere series of hermaphrodite brood-places. When segmentation is perfect, the segments (*proglottides*), on separating from the parent system (*strobila*), possess life and a little power of independent motion, creeping away on moist ground, plants, etc. Their period of separate existence, however, is brief; they burst or decay, and the numerous minute embryos which they contain are ready to commence their career, if in any way transferred into the stomach of an animal of proper kind, which is generally different from that whose intestine their parent inhabited. This may happen by their being swallowed—or even the *proglottis* itself—along with water, grass, etc. Some of the C. W. in this embryo state find their appropriate place in the stomachs of vertebrate, and others in those of invertebrate animals.

The shell being broken or digested, the young cestoid worm is set free. It is extremely unlike the proglottis by which it was generated. It presents the appearance of a vesicle furnished with a few microscopic hooks. It possesses, however, a power of active migration by means of these hooks, and is able to perforate the stomach of the animal which contains it. To this its instinct seems immediately to prompt it, and it is so minute that it passes through the stomach without any serious inconvenience to the animal. It now probably gets into the blood, and is lodged in some of the capillaries, from which it makes its way again by perforation, until it finds a suitable place in some of the tissues or of the serous cavities, in the flesh, or in such organs as the liver or the brain; and here relinquishing all active migration, it rapidly increases in size, at the same time developing a head, which is in fact that of a cestoid worm, and generally either encysts itself or is encysted—in a cyst (q.v.)—according to circumstances, or according to its species. Great numbers of such parasites are sometimes present in a single animal, causing disease and even death. Until recently, they were regarded by naturalists as constituting species and genera quite distinct from the C. W., of which they are really the young; and the name *scolex*, formerly given to one of these supposed genera, has now become a common name for the young of all C. W. in this stage, as *larva* is the common name for the young of insects in their first stage after being hatched from the egg. Those scolices which inhabit vertebrate animals very generally become distended with a watery fluid, and in this state were formerly regarded as hydatids (q.v.); little else, indeed, appearing without very careful examination, but a small bag filled with fluid, the scolex head being formed within the bag, although capable of being everted from it, as the finger of a glove which has been drawn in at the end is turned out. Such is the young of the common tape-worm (*tenia solium*), formerly known to

naturalists as *cysticercus cellulosæ*, and found in the flesh of the pig and of some other animals, and sometimes of man. It is this scolex, existing in great numbers, which produces in the pig the diseased state commonly known as *measly*; and it is very unsafe even to handle measly pork in a raw state, because a scolex accidentally getting into the mouth, and thence into the stomach, is likely to become a formidable inmate of the intestinal canal. It does not appear that this particular species has the power of multiplying in its scolex state, or the circumstances in which it exists in the flesh of the pig may be unfavorable to its so doing, and the prodigious numbers sometimes existing in a single animal have probably all entered by the mouth in the way already described, the contents of a single proglottis or joint of a tape-worm being perhaps sufficient to account for them; but some scolices, as that called *cœnurus cerebralis*, found in the brain of sheep, and the cause of the disease called *staggers*—now known to be the scolex of a *tænia* of the dog—are proliferous by a sort of pullulation, so that clusters of scolices cover the same parental vesicle. Until, however, the scolex reaches the intestine of an animal suited to it, its propagation is entirely unsexual, and no organs of sex exist; but no sooner is it there, than it begins to develop itself into a cestoid worm, and to produce androgynous joints, fertile of new embryos, as already described. Thus we have in these creatures an instance, in its relations the most important known, of the recently discovered alternation of generations. See GENERATIONS, ALTERNATION OF. The transference of the scolex from its place of growth to that in which it becomes a cestoid worm, usually if not always takes place by the animal which contains it being eaten by that whose intestine is suitable to its perfect development. Each kind of cestoid worm is limited to certain kinds of vertebrate animals, and it has been proved by experiment that if introduced into the stomach of other kinds, the scolices soon die. The only C. W. which infest the human species are *bothriocephalus* (q.v.) *luteus*, and tape-worms (q.v.). See Von Siebold's interesting work on tape and cystic worms, printed for the Sydenham Society (London, 1857).

CESTRACION, a genus of sharks, regarded as constituting a distinct family, *cestraciontidae*, although not more than two species are known as now existing. It is characterized by having two dorsal fins and one anal, the first dorsal situated over the space between the pectorals and ventrals; a spine forming the front of each dorsal; a short, wide tail, with its upper lobe strongly notched beneath; the mouth at the fore-end of the snout; spout-holes distinctly visible, rather behind the eyes; eyes destitute of nictitating membrane; small gill-openings; and the front of the mouth armed with sharp angular teeth, whilst the margins and inner surface of the jaws are covered with pavement-like teeth, presenting a general continuity of surface, as in skates, and disposed in rounded oblique scrolls—the former evidently adapted to the seizing of food, the latter to the crushing and bruising of it. The Port Jackson shark or “nurse” (*C. Philippi*) of the Australian seas, and the cat shark of Japan and China (*C. zebra*), seems to differ chiefly in the patterns of color. The *cestraciontidae* are particularly interesting to geologists; for the oldest fossil sharks belong in great part to this family, of which “remains are found even in the paleozoic strata; they become more numerous in the carboniferous series; they are very numerous in the lias and chalk formations.

CESTRUM, the style or spatula used by the ancients in encaustic painting in wax and ivory. See ENCAUSTIC PAINTING.

CESTUI QUE TRUST, a person who possesses the equitable right to deal with property, the legal estate in which is vested in a trustee. There is such a confidence between the cestui que trust and his trustee, that no action at law will lie between them, but they must settle their differences and arrange their disputes in a court of equity. “The phrase *cestui que trust* is a barbarous Norman law French phrase, and is so ungainly and ill adapted to the English idiom, that it is surprising that the good sense of the English legal profession has not long banished it, and substituted some phrase in the English idiom, furnishing an analogous meaning.”—Wharton's *Law Lexicon*.

CESTUI QUE USE, in feudal law, designates a person to whose use another holds the fee of lands or tenements. The phrase has no proper application to the modern American bar, though sometimes applied to one for whom a use exists under a will.

CESTUI QUE VIE, a person whose life is the measure of the duration of an estate. If A. grants to B. an estate to be B.'s own so long as another person named C. lives, then C. is the *cestui que vie*.

CESTUS (Gr. *kestos*, embroidered), a girdle worn by Greek and Roman women close under the breasts, and so distinguished from the *zonæ*, worn round the loins. The C. of Venus was covered with alluring representations, so that Juno borrowed it when she desired to win the love of Jupiter.—CESTUS—or, more correctly, CÆSTRUS, from the Lat. *cædere*, to slay—is also the name of the covering for the hands worn by Roman pugilists. It was at first nothing more than a leathern thong or bandage to strengthen the fist; but afterwards it was covered with knots and nails, and loaded with lead and iron, etc., to increase the force of the blow. It was not uncommon for a puglist armed with the C. to dash out the brains or break the limbs of his antagonist. The Roman puglist (*castrarius*) was often represented in sculpture.

CETA'CEA (Gr. *ketos*, a whale), an order of mammalia (q.v.) greatly differing in general form and habits from the rest of that class, so as indeed to be popularly reckoned among fishes. The C. have a fish-like form, terminating in a fish-like tail or tail-fin, which, however, is not vertical, as in fishes, but horizontal, and is the great instrument of progression; being moved by very powerful muscles, commonly with an oblique downward and lateral movement, like that by which a boat is propelled in sculling, but sometimes by direct upward and downward strokes, when greater velocity is requisite. There are no hinder limbs, and even the pelvis is represented only by two small rudimentary bones, suspended in the soft parts, so that the body tapers gradually and uninterruptedly towards the tail. The fore-limbs are exclusively, or almost exclusively, adapted for swimming; their bones, however, appearing in the skeleton as those of a hand, placed at the extremity of an arm, of which the bones are much abbreviated and consolidated, with little power of motion except at the shoulder-joint, and are entirely concealed in the soft parts of the animal. The head is connected with the body without any apparent neck, and the vertebrae of the neck are partly ankylosed or soldered together. The skin is naked, having no general covering of hair, although some of the species possess conspicuous whiskers. The C. agree with quadrupeds, notwithstanding the great differences already indicated, in the most important parts of their organization. They are viviparous, and suckle their young, for which they exhibit great affection; they are also warm-blooded, breathe by lungs, and not by gills, and come to the surface of the water for the purpose of inhaling air. An approach to their fish-like form is to be seen in seals (q.v.) and other *phocidae*; in which, however, the hinder limbs are largely, although peculiarly developed, whilst the fish-like tail-fin is wanting; the skin has a covering of hair; and the head and fore-limbs more resemble those of ordinary quadrupeds.

The C. are usually divided into two sections—the *herbivorous* and the *ordinary* C.; but the former, constituting the family of *manatidae* (q.v.), have recently, by some systematic naturalists, been rejected from this order altogether, and associated with the *pachydermata*. They differ very widely from the ordinary or true C., not only in their adaptation for the use of vegetable instead of animal food, which appears both in their dentition and in their digestive apparatus, but also in their pectoral instead of abdominal teats, and in their want of *blow-holes* and of any provision for retiring to great depths of the ocean, and remaining there for a considerable time, without returning to the surface to breathe.

The ordinary or true C. are divided into the families of *delphinidae* (dolphin, porpoise, beluga, bottlenose, narwhal, etc.), *physeteridae* or *catodontidae* (cacholot, or sperm-ceti, whale, etc.), and *balenidae* (Greenland whale, rorqual, etc.), the distinguishing characters of which are given under separate heads. They all feed on animal food, some of them pursuing and devouring fishes; others, and these the largest, subsisting chiefly on smaller prey, mollusks, small crustaceans, and even zoophytes, which they strain out of the water by a peculiar apparatus in their mouths. None of the true C. have molar teeth or grinders like the *manatidae*; all the teeth which any of them have are conical; but some of the largest are entirely destitute of teeth. The females of all of them have the teats situated far back on the abdomen. The fore-limbs of the true C. are mere fins, the slight power of grasping with them, which the *manatidae* possess, having entirely disappeared. The resemblance to fishes is increased in many of them by the presence of a dorsal fin. There is a wonderful provision to enable them to spend some time under water, before returning again to the surface to breathe—an arterial plexus or prodigious intertwining of branches of arteries, under the pleura and between the ribs, on each side of the spine. This being filled with oxygenated blood, after the animal has spent some time at the surface breathing, the wants of the system are supplied from it, whilst breathing is suspended, so that some whales can remain below even for an hour. The position of the nostrils is remarkable, almost on the very top of the head, so that the animal can breathe as soon as the head comes to the surface of the water; and the nostrils are furnished with a valve of singular but very perfect construction, a sort of conical stopper of fibrous substance, preventing the ingress of water even under the pressure of the greatest depths. The nostrils appear to be little used for the purpose of smelling, the sense of smell being one which these animals either do not possess at all, or in a very imperfect degree; but they are much used, not only for breathing, but also for *spouting*, or the ejection of water from the mouth, for which reason they are generally called *blow-holes*—the water being forced through them by the compression of two large pouches or reservoirs which are situated beneath them. This compression is accomplished by an action similar to that of swallowing; the throat, however, not being open, but closed. The height to which the water is thrown into the air is extraordinary, and the spouting of the whale is one of those wonders of the ocean never to be forgotten by those who have seen it.

A peculiarity in the skin of the true C. adapts them for their manner of life. The skin is extremely thick, the inner part of it consisting of elastic fibers interlacing each other in every direction, the interstices of which are filled with oil, forming the substance usually called *blubber*. The oil deposited in this unusual situation, not only serves the ordinary purposes of fat, but that also of keeping the body warm, which to a warm-blooded animal, continually surrounded with water, is of great importance:

whilst the elasticity of this extraordinary skin affords protection in the great depths to which some of the whales descend, and in which the pressure must sometimes amount to a ton on every square inch.

The number of known species of *C.* is not great, but their natural history has as yet been very imperfectly studied. All of them are large animals, some of them by far the largest that now exist. Almost all of them—both herbivorous and ordinary—are marine, but some of the smaller species ascend large rivers to a great distance from the sea; and one, of the family *delphinidae*, belongs exclusively to fresh waters, being found only in the upper tributaries of the Amazon and the elevated lakes of Peru.

Fossil cetacea have been hitherto discovered only in the tertiary formation. Their remains represent species not only belonging to each of the recent families of true *C.*, but have supplied materials for forming a new family intermediate between the true whales and the herbivorous cetacea. These fossils were originally described as reptiles; but they have been satisfactorily shown to be carnivorous *C.* by Owen, who, from their remarkable conjugate teeth, has given the typical genus the name of *zeuglodon* (q.v.), and the family that of *zeuglodontidae*. In all, six or seven species have been described belonging to this family, from the eocene and miocene beds of Europe and America. The *delphinidae* appears first in the miocene strata, and continue through the newer beds. The remains of a narwhal, which cannot be distinguished from the living species, have been found in several places in England. Of *physeteridae*, three species have been noticed in pleiocene and pleistocene strata, belonging to the recent genus *physeter*. Fossil *balenidae* occur in the miocene and newer beds. Only four species have been described, if we exclude *cetotolites* (q.v.), a name given to teeth and ear-bones, belonging to animals of this family, which occur in great numbers in the Suffolk Crag.

CETEWAYO. See ZULULAND

CETOTOLITES, a name given by Owen to fossil cetacean teeth and ear-bones, which occur in great abundance in the Red Crag of Suffolk, a member of the pleiocene period. They are rubbed and water-worn, and have evidently been washed out of some earlier strata, which remain yet unrecognized. The extent of these earlier strata must have been very great, seeing that the remains now extend over a large district in Essex and Suffolk, and attain a thickness, in some places, of not less than 40 ft. Prof. Henslow, in 1843, drew the attention of agricultural chemists to this deposit, as a source of materials for manure, and since then superphosphate manures have been manufactured from it to the value of many thousand pounds annually; a striking example of the valuable practical results which frequently flow from a purely scientific discovery.

CETRA'RO, a t. of s. Italy, in the province of Cosenza, situated on the Mediterranean, 24 m. n.w. of Cosenza. It has anchovy fisheries, and a population of about 7000.

CETTE, a seaport t. of France, in the department of Hérault, is built on a neck of land between the lagoon of Thau and the Mediterranean, in lat. 43° 24' n., long. 3° 42' east. The town, which is entered by a causeway raised above the Thau lagoon, and a bridge of 52 arches, is fortified, and the harbor is defended by a citadel and forts. The space inclosed by the piers and breakwater forming the harbor is about 30 acres, and has a depth of from 16 to 19 feet. A broad deep canal, lined with excellent quays, connects the port with the lake of Thau, and so with the Canal du Midi and the Rhone, thus giving to *C.* an extensive inland traffic; it has likewise an active foreign commerce. The principal trade is in wine, brandy, salt, dyestuffs, perfumery, and verdigris. *C.* has ship-building yards, and fisheries of oysters and anchovies. Pop. '96, 32,729.

CETTIGNÉ, or **CETINJÉ**. See MONTENEGRO.

CETUS, or **THE WHALE**, the largest of all the constellations. It reaches from 0° to 25° s. declination, and from 0 to 2h. 30m. right ascension. Mira, a variable star, is the most conspicuous feature.

CEU'TA, a t. belonging to Spain, situated in the kingdom of Fez, on the n. coast of Africa, and opposite to Gibraltar, in lat. 35° 54' n., and long. 5° 16' west. It is strongly fortified, and defended by a citadel and forts erected on mount Hacho, the ancient *Abyla*, or south pillar of Hercules. It is the most important of the four Spanish *presidios*, or convict establishments, on this coast. The harbor is small and not very safe; and the population, which is about 10,700, is composed of Spaniards, Moors, Negroes, Mulattoes, and Jews, mostly very poor, and employed in trade and fisheries. Many of the Spaniards living here are state-prisoners, and even the garrison is partly manned by convicts. *C.*, formerly called *Septa* or *Septum*, was taken from the Vandals in 534 by Justinian, who fortified the place anew. In 618, it fell into the hands of the western Goths; afterwards it was taken by the Moors, who held it until 1415, when it was captured by the Portuguese. It was annexed, with Portugal, to the crown of Spain in 1580, and was the only place on the African coast retained by Spain when Portugal was restored to its independence in 1640.

CEVADIL LA. See SABADILLA.

CEVENNES (ancient *Cebenna*), the chief mountain range in the s. of France. With its continuations and offsets, it forms the water-shed between the river systems of the Rhone and the Garonne. Its general direction is from n.e. to s.w., commencing at the southern extremity of the Lyonnais mountains, and extending under different

local names as far as the Canal du Midi, which divides it from the northern slopes of the Pyrenees. The central mass of the C. lies in the départements Lozère and Ardèche, Mont Lozère reaching an elevation of 4,884 ft., and Mont Mézen (the culminating point of the chain) an elevation of 5,794 feet. The average height is from 3000 to 4000 feet. The masses consist chiefly of amphibolic rocks, graywacke, and limestone, covered with tertiary formations, which in many places are interrupted by volcanic rocks.

The C. has been celebrated as the arena of religious warfare. As early as the 12th c. the several sects known by the names, the "Poor of Lyons," the *Albigenses* (q.v.), and the *Waldenses* (q.v.), were known and persecuted in this district. After the revocation of the edict of Nantes by Louis XIV. in 1685, a series of cruel persecutions of the Protestants in the C. began, especially in 1697, after the peace of Ryswick. "Dragonades" (q.v.) were employed to enforce the doctrines of the monks sent as missionaries into the heretical district. All persons suspected of Protestantism met with the most harsh and cruel treatment. Some of the inhabitants emigrated, others fled into the fastnesses of the mountains. Driven to desperation, the persecuted people at length rose to arms, and the murder of the abbé du Chaila, who was at the head of the dragonades, gave the signal of a general insurrection in 1702. The insurgent peasants were styled *Camisards* (q.v.) perhaps from *camise*, a smock worn by the peasantry. Headed by bold leaders, the most famous of whom were Cavalier and Roland, they defeated the troops sent against them by Louis again and again, until that king thought the insurrection of sufficient importance to require the presence of the distinguished general, marshal Villars; but he was recalled before the revolt had been put down, and it was left to the duke of Berwick to extinguish it in blood; the contest terminating in an entire desolation of the province, and the destruction or banishment of a great portion of the inhabitants. The embers of religious hatred still remained glimmering through the following century, and, after the restoration of the Bourbons in 1815, burst out into flames in the terrible persecution of the Protestants in Nîmes (q.v.) and other places in the s. of France. See *Histoire des Troubles des Cévennes* by Court de Gébeline (1760); Schulz's *Geschichte der Camisarden* (1790); Bray's *Revolt of the Protestants of the C.* (1870).

CEYLANITE. See SPINEL.

CEYLON' (the *Taprobane* of the Greeks and Romans, and the *Serendib* of the *Arabian Nights*), a valuable island and British colony in the Indian ocean, to the s.e. of the peninsula of Hindustan, from which it is separated by the gulf of Manaar and Palk's strait. Recent observations have shown its true place to be between 5° 55' and 9° 51' n. lat., and 79° 42' and 81° 55' e. long. Extreme length from n. to s., from Point Palmyre to Dondra Head, 271½ m.; greatest width, from Colombo to Sangemankande, 187½ miles. Area, including dependent islands, 25,365 sq. miles.

Physical Features.—In natural scenery, C. can vie with any part of the world; and as it rises from the ocean, clothed with the rich luxuriance of a tropical vegetation, it seems to the voyager like some enchanted island of eastern story. Its hills, "draped with forests of perennial green," tower grandly from height to height, till they are lost in clouds and mist. Near at hand, a sea of sapphire blue dashes against the battlemented rocks that occur at isolated points, and the yellow strands are shaded by groves of noble palms. In shape, C. resembles a pear, but its inhabitants more poetically compare it to one of their elongated pearls. Undulating plains cover about four parts of the island, and the fifth is occupied by the mountain-zone of the central s., which has an elevation of from 6,000 to 8,000 ft. above the sea-level. Pedrotallagalla, the highest mountain in the range, attains the height of 8,280 ft.; the celebrated mountain of Adam's peak, 7,420 ft.; and the table-land of Neuera Elha, 6,210 feet.

Geology.—The mountain system is mainly composed of metamorphic rocks, chiefly gneiss, frequently broken up by intruded granite. With the exception of some local beds of dolomitic limestone, the gneiss is everywhere the surface rock, and the soil is composed of its disintegrated materials. No fossils, as was to be expected, have been noticed in C., if we except the semi-fossil remains of mollusca, crustacea, and corals, belonging to living species, which occur in the rude breccias of the n. in the neighborhood of the sea. The northern part of the island is rising, and there also the land is making encroachments on the sea from another agency. The immense masses of corals continually increasing, retain the debris brought from the Indian continent by the currents of the sea, and thus form a flat, ever-increasing madreporé plain.

Of metals and minerals, iron, in the form of a carbonate, can be obtained in great quantities, and of such purity as to resemble silver. Tin is found in the alluvium at the base of the mountains, and on the heights the rare metal tellurium has been discovered. Nickel and cobalt are scarce. Anthracite and rich veins of plumbago exist on the southern range of hills. The *gems* of C. have been celebrated from time immemorial, and they are most plentiful in the alluvial plains at the foot of the hills of Saf-fragam. Sapphires, rubies, the oriental topaz, garnets, amethysts, cinnamon stone, and cat's-eye, are the principal gems and precious stones of the island. The most valuable is the sapphire; and one of these, found in the year 1853, was worth more than £4,000. The pearl fisheries of C. have long been famous, and since the beginning of the century are conducted directly for behoof of the government. But sometimes fishing operations

have to be suspended for a considerable period; thus there was no fishery from 1863 until 1874. In 1887, pearls worth \$195,000 were secured; and in 1891, 960,000 rupees, but during the four succeeding years the industry was unproductive.

Rivers.—The most important river in C. is the Mahawelli-ganga. It has its source in the vicinity of Adam's peak, and after draining more than 4,000 sq.m., it separates into several branches, and enters the ocean near Trincomalee. The s. side of the island is watered by 10 rivers of considerable size, which flow into the sea between Point de Galle and Manaar. On the e. coast, the rivers are smaller, but still more numerous, and many others traverse the northern and eastern provinces.

Harbors.—Point de Galle (q.v.) and Trincomalee (q.v.) are the two harbors of Ceylon. The former is small and dangerous, but the latter is unsurpassed as a safe and commodious port. The variation of the tides is very trifling; the rise and fall not generally exceeding 18 to 24 in., with a third of increase at spring-tides.

In *climate*, C. has a great advantage over the mainland of India, and as an island, enjoys a more equable temperature. The average for the year in Colombo (q.v.) is 80° in ordinary seasons. April is the hottest month; and in May the s.w. monsoon commences amid a deluge of rain, and continues the prevailing wind till Oct., when the n.e. monsoon sets in: 80 in. is the average annual fall of rain, though in an exceptional year, 120 in. have been registered. The beautiful table-land of Neuera Ellia was first visited by Europeans in 1826, and is now used as a sanatorium. Here the thermometer in the shade never rises above 70°, while the average is 62°; the nights are cool and refreshing. The n. of the island, including the peninsula of Jaffna, the plains of Neuera Kalawa, and the Wanny, may be reckoned as a third climatic division. Here the annual fall of rain does not exceed 30 in., and irrigation is largely employed in agriculture.

Flora.—The general botanical features of C., especially of the lowlands, are nearly identical with those of southern India and the Deccan, although it possesses a few genera of plants not to be found in those regions. Its phænogamic plants are limited to about 3,000. The beautiful ixoras, erythrinæ, buteas, Jonesias, and other flowering shrubs bloom in the forests. At an elevation of 6,500 ft., the acanthaceæ cover large tracts of ground, and the tree-fern reaches the height of 20 feet. On the highest ground, rhododendron attain the size of timber-trees. The coral-tree (*eurythrina indica*), the murutu (*lagerstræmia reginae*), and the *Jonesia asoca* are amongst the most magnificent of the flowering trees. The fig tribe are planted in the vicinity of the temples. In the forests, climbing-plants and epiphytes of prodigious size and striking appearance cover the trees with a mass of parasitical foliage of extraordinary growth. The palmaceæ are very conspicuous in the vegetation of C., although not more than 10 or 12 species are indigenous: the cocoa-palm—of which it is estimated there are not less than 20 millions of trees—the talipot, the palmyra—which forms extensive forests in the n. of the island—and the jaggary palm are the most noteworthy. Of timber-trees, 416 varieties are known, and amongst these the satin-wood holds the first rank. The flora of the highlands, above 2,000 ft., and up to 6,000 or 7,000, though much resembling that of the Neilgherries, has a marked affinity to the vegetation of the highlands of Malacca and Java, especially the latter.

Fauna.—A knowledge of the fauna of C. has been greatly advanced by the labors of Drs. Templeton and Kelaart and Mr. Edgar Layard. *Quadrumanous* animals are represented by the *loris gracilis*, and five species of monkeys. Sixteen species of the *cheiroptera* or bat tribe, exist in C., and what is very remarkable, many of these rival the birds in the brilliancy of their colors. The *pteropus Edwardsi* (the flying-fox of Europeans) measures from 4 to 5 ft. from tip to tip of its extended wings. Of the larger *carnivora*, the bear and the leopard, and of the smaller, the palm-cat and the glossy genet (the civet of Europeans) may be mentioned. The dreaded tiger of India, the cheeta, the wolf, and the hyena are happily not met with in Ceylon. Deer, buffaloes, and the humped ox of India are amongst the *ruminantia*; the little musk-deer (*moschus meminna*) is less than 2 ft. in length. The *pachydermata* are represented by the elephant and the wild boar; the former, which is for the most part tuskless, is emphatically lord of the forests of Ceylon. The most remarkable of the *cetacea* is the dugong. Whales are captured off the coast; 320 species of *birds* have been ascertained by Drs. Templeton and Kelaart and Mr. Layard. The song of the robin and long-tailed thrush, and the flute-like voice of the oriole, are heard over the whole mountain zone, and far down into the neighboring plains. Eagles, the beautiful peregrine falcon, owls, swallows, kingfishers, sun-birds, bulbuls, crows, paroquets, pigeons, pea-fowl, jungle-fowl, and many others of the feathered tribe might be mentioned did space permit. Myriads of aquatic birds and waders, amongst which the flamingo is conspicuous, cover the lakes and lagoons. The crocodile is the largest reptile in the island; tortoises and lizards are also found. There are a few species of venomous snakes, and of these the ticpolonga and the cobra da capello are the most deadly.

Inhabitants.—The Singhalese, the most numerous of the natives of C., are the descendants of those colonists from the valley of the Ganges who first settled on the island 543 B.C. In their customs, costume, and general appearance, they have remained unchanged since the days of Ptolemy. The dress of the men, who have delicate features and slender limbs, is singularly effeminate, and consists of a *comboy* or waist-cloth, very much resembling a petticoat; their long hair, turned back from the forehead, is confined with combs, and ear-rings are worn by way of ornament. The women,

in addition to the comboy, cover the upper part of the figure with a white muslin jacket, and adorn themselves with necklaces, bangles, rings, and jewelry. The Singhalese are false and cowardly, but manifest a strong affection for their relatives, and a reverence for old age. Polyandry still lingers in the interior of C., and was formerly universal; it is now, however, chiefly confined to the wealthier classes, amongst whom one woman has often three or four husbands. The Kandyans, or Highlanders, are a more sturdy race, and maintained their independence for three centuries after the conquest of the low country by European settlers. The Malabars, or Tamils, have sprung from those early invaders of C., who from time to time swept across from southern Hindustan, and contended with the Singhalese kings for the sovereignty of the island. They have formed the chief population of Jaffna for full 2,000 years, and constitutionally excel the Singhalese and Kandyans. The Moormen, who are the most energetic and intelligent of the native communities, are met with in every province as enterprising traders. They are a very distinct race from the Singhalese, but have no tradition of their origin. Europeans generally believe them to be of Arab descent, but Tennent is of opinion that "they may be a remnant of the Persians, by whom the island was frequented in the 4th and 5th centuries.

The "burghers" of C. are a people of European descent, who have become naturalized. Those of Portuguese extraction hold the lowest place, and are mostly tradesmen and artisans; but the Dutch burghers frequently fill responsible posts, and are employed in the government offices.

Besides the races already alluded to, there is a remarkable tribe of outcasts—the Veddahs—hardly removed from the wild animals of the forest, and believed to be descended from the Yakkhos, the aboriginal inhabitants of the country. They occupy a district in the eastern part of the island, and have there preserved their ancient customs and manner of living unaltered for more than 2,000 years. They appear to be without the instinct of worship, and have no knowledge of a God. The tribe is divided into the *Rock Veddahs* and the *Village Veddahs*. The former hide themselves in the jungle, live by the chase, and sleep in trees or caves. They use fire to cook their meat, and their greatest gastronomic treats are the iguana lizard and roasted monkey. Their language—if the few words they make use of can be called by that name—is a dialect of the Singhalese. The Village Veddahs locate themselves in the vicinity of the European settlements, on the eastern coast, living in rude huts of mud and bark, and are hardly more civilized than their brethren of the jungles. The exertions of government to reclaim this harmless but degraded people have in some degree succeeded, and a promising colony has been formed.

Population.—Sir J. E. Tennent is of opinion that C., when in the height of its prosperity, must have been ten times as densely peopled as at the present day. In the official returns for the year 1891, the area and population of the provinces of Ceylon are given as follows:

PROVINCES.	Area; Sq. Miles.	Population, 1891.		PROVINCES.	Area; Sq. Miles.	Population, 1891.	
		Total.	Per Sq. m.			Total.	Per Sq. m.
Western.....	1,351.5	763,187	565	North-Western.....	3,024.5	320,032	.41
Central.....	2,323.7	474,487	205	North Central.....	4,046.7	75,319	19
Northern.....	3,171.0	319,193	101	Uva.....	3,725.0	159,155	43
Southern.....	1,980.0	489,761	247	Sabaragamuwa.....	2,085.0	258,605	102
Eastern.....	3,657.5	148,727	41	Total.....	25,364.9	3,008,466	118

According to the census of 1891, it was estimated that the inhabitants of Ceylon numbered 3,008,466 souls, of whom 2,041,158 are native Singhalese, 21,231 Eurasian descendants of Europeans, and 6008 English, with 723,853 Tamil immigrants and settlers, and 216,156 Moormen, Malays, Veddahs, and other races.

Religion.—The Singhalese are devoted to Buddhism (q.v.), which is the prevailing religion of the island. It does not exist, however, in that state of purity in which it is still found in the Indo-Chinese peninsula. Its sacred books are identical with those of Burmah and Siam, and both record the doctrines of Gautama in the Pali language; the deviations are in matters of practice. The Malabar kings adulterated Buddhism to a considerable extent with Brahmanism, introducing the worship of Hindu deities into the Buddhist temples, and this continues more or less to be the case. More than once have the Buddhists of C. sought to restore the purity of their faith—at one time sending deputies to Siam, at another to Burmah, with this object in view. The Burmah or Amarapura sect have long been the reformers of Singhalese Buddhism, and maintain no very friendly relations with the party, who, supported by the priests of Siam, acknowledge the civil power in matters of religion, sanction the worship of Hindu deities and the employment of the priesthood in secular occupations, uphold caste, and restrict the

sacred books. Caste was acknowledged by the Singhalese prior to the introduction of Buddhism, which in principle is opposed to it; but so firmly was it rooted, that it still endures, though more as a social than a sacred institution. Gautama Buddha is said to have visited C. three different times to preach his doctrine, and his *Sri-pada*, or sacred footstep, on the summit of Adam's Peak (q.v.), still commands the homage of the faithful. Buddhism was not, however, permanently introduced into C. till 307 B.C., when Mahindo, obtaining the support of the king, established it as the national faith. The influence of the priests gradually increased, and, by the piety of the Singhalese kings, monasteries were richly endowed; for though the Buddhist monk is individually forbidden to possess goods, a community may own property to any extent; and it is a remarkable fact that, at the present day, no less than one third of the cultivated land of the island is computed to belong to the priesthood, and is exempt from taxation. The priests of C. are divided into two orders—the *Samanaros*, and those who, after a time of probation, receive the higher grade of *Upasampada*. The fraternity are not raised by education above their countrymen, and the respect paid them is directed more to the dress than to the person of the individual. Any member is at liberty to lay aside his ascetic character, and return to a secular life. The most celebrated Buddhistic relic in C. is the *Dalada*, or sacred tooth of Gautama, at Kandy, which is guarded with jealous care, and preserved in an elegant shrine; but it is well known that the original relic was destroyed by the Portuguese, and the present substitute is a piece of discolored ivory, bearing no resemblance to a human tooth. In all Buddhist countries, the sacred buildings present, with certain modifications, the same general character (see articles: **BUDDHISM**, **BURMAH**, etc.); and in C. we find the three classes represented by the dagoba, or relic-shrine (*datu*, a relic, and *gabbhan*, a shrine), the temple proper, and the vihara or monastery. The labor bestowed on these edifices in the early ages of the Singhalese monarchy is truly astonishing. In the n. of the island, ruined cities—buried for ages in the depths of the forest—have been discovered, revealing monuments that in dimensions may almost compare with the pyramids of Egypt. The most remarkable of these vestiges of an early civilization is Pollanarua, the ancient capital of C.; and here is the celebrated *Gal-wihara*, a rock-hewn temple, supposed to be “the only example in Ceylon of an attempt to fashion an architectural design out of the rock, after the manner of the cave-temples of Ajunta and Ellora.” The reclining figure of Gautama is 45 ft. in length, the upright one measures 23 ft.; and the sitting image on the left is 16 ft. from the altar to the top of the head. The cave-temple of Dambool was built 100 B.C., and is the most celebrated in the island. The bell-shaped tapering dagobas of C., as relic-shrines, answer to the pagodas of Burmah—which they very much resemble—and the topes of Afghanistan. The ruins of the Jaytawanarama dagoba still reach the height of 249 ft.; its diameter is 360 ft.; and from base to pinnacle it is covered with trees of the largest size. This enormous structure contains 20 millions of cubical ft.; and sir J. E. Tennent concludes that to erect such a mass of masonry, even in the present day, “would occupy 500 bricklayers from six to seven years,” at the cost of a million sterling. The Ambustella of Mihintala is another remarkable dagoba. A very famous object in connection with Buddhism in C. is the sacred Bo-tree of Anarajapoor (peepul, *figus religiosa*), which was planted there 288 years B.C., and is by far the oldest tree in the world of which an authentic history exists. See **BO-TREE**. Amongst the antiquities of C. must be mentioned those wonderful monuments of the former greatness of the Singhalese people—the ruined tanks; with which almost nothing of a similar kind, whether ancient or modern, can be compared; 30 colossal reservoirs, and about 700 smaller tanks, still exist, though for the most part in ruins. The restoration of these magnificent works of irrigation has recently been begun. Brahmanism or Hinduism (q.v. under **INDIA**) is the faith of the Tamils or Malabars, but the Moormen are Mohammedans. After the expulsion of the Dutch Christians, Protestant missions to the natives of C. were commenced by the Baptists in 1813. The Wesleyan Methodists followed in 1814, the Americans in 1816, the church of England in 1818, and Christian instruction has made some progress amongst the native populations. Of these the peasantry of the Kandyan hills have proved the least accessible to its influence. Schools, collegiate institutions, and female seminaries, under the direction of the missionaries, are in successful operation.

Government.—The administration of C. is vested in a governor, who is assisted by an executive council of five members, and a legislative council of seventeen members. In the year 1891 there were in existence a number of municipal councils, which, with local boards and village tribunals, give the people a fair measure of self-government. The governor's legislative council of seventeen is also partly elective. The Maldiv Islands, lying 500 miles to the west, are a dependency of Ceylon. The colony made very great progress under the able administration of Sir H. Ward. In 1895 the revenue was 20,982,809 rupees. The chief items of revenue are the customs, licenses, sale of government timber and salt, receipts from government railway, etc. The chief exports of Ceylon are cinnamon, cocoanuts, tea, cinchona, plumbago, cacao, cardamon, and coffee.

The Cinghalese, or Singhalese language is spoken in the interior and on the s. coast of the island of Ceylon. It is a modification of the aboriginal Ebu by the Sanskrit, with a tinge of Malay. The Cinghalese has so far degenerated that there is now a material difference between the vernacular and the written language. The former is copious and has a regular grammar. There are 50 letters: 8 vowels, 3 diphthongs, and 34 consonants; but all representing only 30 sounds: 7 vowels and 23 consonants. In literature the language has several original poems of some merit, and an extensive and interesting series of native chronicles, but the most valuable literature is written in Pali. This Pali is one of the Prakrits of ancient India, "which was spoken in the 6th c. before Christ, and has been a dead language for upwards of 2000 years."

The records of C's. early history came to light in 1826, and Mr. Turnour, devoting himself to their study, composed an *Epitome of the History of C.*, from the year 543 B.C. to 1798 A.D.; and he records the reigns of 165 kings, who reigned during this space of 2,341 years. The most famous of the Singhalese books is the *Mahawanso*, a metrical chronicle, in the Pali language, which gives an account of the island during the above 23 centuries. The story begins with the invasion of Wijayo (543 B.C.), son of a petty Indian sovereign in the country watered by the Ganges. He subdued the Yakkhos, the aboriginal inhabitants; married a daughter of one of the native chiefs, whom he subsequently repudiated for an Indian princess; and founded a dynasty that held undivided sovereignty in C. for nearly eight centuries. He bestowed on his kingdom his patrimonial name of Sihala (whence Singhalese, Ceylon), and promoted the settlement of colonists from the mainland. In the reign of king Devenipatiissa (307 B.C.), Buddhism was established as the national religion, and his reign was further remarkable by the planting of the sacred bo-tree, 288 B.C.; and now commenced the erection of those stupendous buildings already noticed. The next important epoch in Singhalese history is the usurpation of the Malabars (237 B.C.), foreign mercenaries from the Coromandel coast, to whom the native sovereigns had intrusted the defense of the island. Several Malabar invasions are chronicled in the history of C., and these foreigners long contended with the native princes for supreme authority. Passing on to 1071 A.D., a native dynasty was then re-established in the person of Wijayo Bahu, which, for 100 years, delivered the country from the dominion of the Malabars. Prakrama Bahu commenced a reign, in 1153, the most renowned in the records of Ceylon. He devoted himself to religion and agriculture, and besides many notable religious edifices, he caused no less than 1470 tanks to be constructed, subsequently known as the "seas of Prakrama." Thirty years after the death of this monarch, the Malabars landed with a large army, and speedily conquered the whole island. In 1235, a native dynasty recovered a part of the kingdom. During the reign of Dharma Prakrama IX. the Portuguese first visited C., 1505; but it was in 1517 that they first formed a permanent settlement at Colombo for trading purposes. Their encroachments soon raised the patriotic Kandyans, and it is a remarkable fact, that though at the first visit of the Portuguese in 1505 they were even ignorant of the use of gunpowder, they, after a while, excelled their enemies as musketeers, and were finally able to bring 20,000 stand of arms to bear against them. "Amity, commerce, and religion," was the Portuguese motto; but their rule in C. is a sad story of rapacity, bigotry, and cruelty. They were at last driven from the island by the Dutch in 1658, after a contest of 20 years, when, as sir J. E. Tennent remarks, "the fanatical zeal of the Roman Catholic sovereign for the propagation of the faith, was replaced by the earnest toil of the Dutch traders to intrench their trading monopolies; and the almost chivalrous energy with which the soldiers of Portugal resisted the attacks of the native princes, was exchanged for the subdued humbleness with which the merchants of Holland endured the insults and outrages perpetrated by the tyrants of Kandy upon their envoys and officers." But the purely military tenure of the Dutch was destined to give place to the colonization of the British. It was during the great European war succeeding the French revolution, that the English gained possession of the island. On the 1st Aug. 1795, an expedition under col. James Stuart landed at Trincomalee, which was speedily captured, and finally the garrison of Colombo surrendered on the 16th Feb. 1796. By this capitulation all the Dutch settlements and strongholds in C. were ceded to the English; though the island was not formally annexed to the British crown till the peace of Amiens, 27th Mar. 1802. The native sovereigns, however, continued in the possession of their mountain territory; but at length the Kandyan king, Wikrama Raja Singha, after perpetrating the most frightful atrocities on his own people, seized and murdered certain native merchants, British subjects, trading to Kandy. War followed, Jan. 1815; Kandy was taken, and the tyrant sent a captive to the fortress of Vellore. On the 2d Mar. 1815, a treaty was concluded with the native chiefs, by which the king was formally deposed, and his territories annexed to the British crown.

Since then, the island has made rapid strides in material prosperity. The mountain-forests have been replaced by plantations of coffee. Many important public works have been completed, and others are still in progress. Several good roads have been constructed, including a magnificent mountain-road between Colombo and Kandy, and in 1895 there were 297 miles of railroad open for traffic. In 1895 there were in the government schools 44,252 scholars; and there are also a large number of mission schools under the control of various religious denominations, besides private schools for the children of Europeans. The total number of scholars at schools of all kinds was 169,834 in 1895.

See *Ceylon, Physical, Historical, and Topographical*, etc., by sir James Emerson Tennent (Lond. 1859); *Christianity in Ceylon*, by the same author (Lond. 1850); *The Statesman's Year-book for 1897*; *Ceylon, a General Description of the Island*, by an officer, late of the Ceylon rifles (1876); *Ceylon*, by Haeckel (1883), and the works of Gordon-Cumming (1891), Carpenter (1892), Ferguson (1893), and Murray (1894).

CEYX. See KINGFISHER.

CEZIM-BRA, a coast t. of Portugal, in the province of Estremadura, about 18 m. s. of Lisbon. C. has active fisheries, and a pop. of 6000.

CHABAS, FRANÇOIS JOSEPH, 1817-82. He devoted himself especially to Egyptian archaeology, in which he was considered among the highest authorities. His principal works are *Le Papyrus Magique Harris*; *Voyage in Egypt and Syria*; *Les Pasteurs en Egypte*, and *Studies in Ancient History*.

CHABASITE. See ZEOLITE.

CHABLAIS, an old division of the province of Annecy in Savoy, now the arrondissement of Thonon, France. It once formed a part of the kingdom of Burgundy. Under the French empire it was a part of the department of Lemán; in 1814 its possessions went to Sardinia, and in 1860, with all of Savoy, it was given over to France.

CHABLIS, a village in France, dep. of Yonne, which gives name to a much esteemed white Burgundy (q. v.) wine.

CHABOT, PHILIPPE DE, abt. 1480-1543; a French general and admiral. He defended Marseilles in 1524, but the next year was made prisoner at Pavia. He was subsequently made admiral, and in 1535 commander in chief. He is said to have been the first to suggest the colonization of Canada. There is a monument to him in the Louvre.

CHABRIAS, an Athenian gen. who assumed command about 392 B.C. He defeated the Spartans at Ægina in 388, and again at Naxos in 376. He commanded with Iphicrates and Callistratus at Corcyra, and repulsed Epaminondas before the walls of Corinth. In 366 he was accused of treachery in advising the surrender of Oropus to the Thebans, and was defended by Plato. At the commencement of the social war, in 357, he joined Charos in the command of the Athenian fleet. At the siege of Chios his ship was disabled, but he refused to retire, and was killed while fighting. C. was famous for inventing a new style of receiving a charge, which was on the left knee, the shield resting on the ground, and the spears pointed at the enemy.

CHACHAPOYAS, or SAN JUAN DE LA FRONTERA, a t. in the department of Amazonas, Peru, 410 m. w. of Lima; pop. 5,000. It is on a tributary of the Marañon, in a rich agricultural region.

CHACMA. See BABOON.

CHACO, EL GRAN, a large country in South America, about the middle of the continent. The n. portion is well watered and densely wooded, with intervals of grassy plains and marshes, and capable of producing nearly all tropical vegetation. The s. portion is for the most part a desert and can be cultivated only after irrigation. The n. portion belongs to Bolivia, while the s. is occupied almost entirely by Indians, and is included in the Argentine Republic.

CHACONNE (Fr.), an obsolete dance, probably Spanish (*chacóna*, from Basque *chocuna*, pretty). The movement is slow, and the music, a series of variations on a ground bass, mostly eight bars in length, appears in sonatas as well as in ballets.

CHAD, TCHAD, OR TSCHAD (chad), written also TSAD. A lake of Central Africa, between Bornoo on the w., Kanem on the n. e., and Baghirmi on the s. e. It probably extends from n. to s. about 120 or 150 miles; from e. to w. it is variously estimated from 80 to 130 miles. The area extends from 4200 in the dry season to 19,300 sq. m. in the wet season.

CHAD, SAINT, bishop of York in the 7th century. He was educated under Aidan at Lindisfarne. At his death he held the see of Lichfield. His day is Mar. 2.

CHADBOURNE, PAUL ANSEL, D.D., LL.D., b. Me., 1823; professor of natural history and chemistry in Williams College and in Bowdoin college, and in 1867, chosen president of the university of Wisconsin, at the same time becoming professor of metaphysics. He was elected president of Williams college in 1872; resigned in 1880; and became president of the Massachusetts Agricultural College in 1882. He was author of *Natural Theology*, and *Instinct in Animals and Men*, and editor of *The Wealth of the United States*. He d. 1883.

CHADWICK, Sir EDWIN, C.B., a distinguished social and sanitary reformer, b. in the vicinity of Manchester, England, 24th Jan., 1801. He studied law, but, early devoting his attention to questions of social, sanitary, and political science, he attracted the notice of lord Grey's government, by whom he was appointed an assistant-commissioner to inquire into the operation of the poor-laws in England and Wales. His report, published with others in 1833, commanded most attention, being remarkable alike for the wide and searching character of its investigations, the happiness of its illustrations, and the convincing proofs it furnished as to the necessity of reform in the system of

administration. Its merit was recognized by those who had the power to reward him; and on the organization of the new poor-law board, C. was appointed secretary. In connection with this board, and the general board of health, C. for twenty years was energetic in the origination and administration of remedial measures relative to the distribution of poor-law funds, and to the sanitary condition of the country. He likewise gave much attention to the constitution of the constabulary force, with a view to the better prevention of offenses and the readier detection of criminals. On a change being made in the board of health, in 1854, C. retired with a pension. He subsequently took great interest in promoting competitive examinations for government offices, and indeed in almost all questions of social economy. He was long an active member of the association for the promotion of social science. In 1859-60, he collected evidence for the education commission. He died in 1890.

CHADWICK, GEORGE WHITFIELD, American composer, b. in Lowell, Mass., Nov. 13, 1854. He studied under Eugene Thayer, and in 1877 went to Europe and placed himself under Jadassohn and Reinecke in Leipsic, and studied the organ and composition under Rheinberger in Munich. Returning to America in 1880, he became organist in the South Congregational church, Boston, and instructor in harmony and composition in the New England Conservatory of Music. His works include: *The Viking's Last Voyage*, 1881; overture to *Rip van Winkle*; and music for the *Columbian Ode*, sung at the opening of the World's Exposition at Chicago, in 1893.

CHADWICK, JOHN WHITE, b. Mass., 1840. Leaving school at the age of 13 years, he worked at the trade of shoemaking until 1857, when he entered the normal school. He afterwards graduated from Exeter Academy and the Harvard divinity school. He has been pastor of the second Unitarian society in Brooklyn since 1864. C. is one of the leaders of the rationalistic school of Unitarianism. His works are: *A Book of Poems*; *The Bible of To-day*; *The Faith of Reason*; *The Man Jesus*; *Some Aspects of Religion*; *Belief and Life*; *Old and New Unitarian Belief* (1894), and many articles in magazines.

CHÆRONEIA, a city of Bœotia, in ancient Greece, near the Cephissus, on the borders of Phocis. It is celebrated on account of several important battles fought in the neighborhood. In 447 B.C., the Bœotians here obtained a victory over the Athenians; and in 338 B.C., Philip of Macedon signally defeated the united forces of the Athenians and Bœotians, and so crushed the liberties of Greece. A mound of earth, about a mile from the modern village of Kapurna, which occupies the site of the old city, still marks the place where the Thebans who fell in the battle were buried; and a magnificent lion, which col. Mure pronounced to be "the most interesting sepulchral monument in Greece," was excavated from this tumulus some years ago. At C., also, 86 B.C., Sulla defeated the generals of Mithridates. Plutarch was a native of this town.

CHÆTODONTIDÆ, a family of acanthopterous fishes, nearly corresponding to the genus *chætodon* (Gr. hair-tooth) of Linnæus; and also named *SQUAMIPENNES* (Lat. scaly-finned), because of the most distinctive character of the family, the incrustation of the soft portions of the dorsal and anal fins, and often of the spinous parts also, with scales, the fins appearing to taper gradually out of the thickness of the body, which is in general remarkably compressed, so that, without dissection, it is impossible to tell where they begin. The scales are strongly ctenoid (q.v.). The typical genus *chætodon*, and those most nearly allied to it, have hair-like teeth, so that their jaws resemble brushes; some fishes of the family, however, have trenchant teeth on the jaws, and some, as *brama* (q.v.), have card-like teeth both on the jaws and palate. Most of the C. are tropical; only one species, *Brama raii*, is ever found in the British seas. They generally frequent rocky shores. Their colors are often extremely gay, and usually disposed rather in stripes or bands than in spots. See illus., *FISHES*, vol. VI.

CHAFER, a common name of those beetles or coleopterous insects, which either in the perfect or larva state, are destructive to plants; particularly those which devour the wood, bark, or roots of trees. From these, however, it is sometimes extended to some coleopterous insects which have no such habit. The word C. is seldom used alone, but generally as part of a name, with some prefix; thus, we have *cock-chaffer*, *rose-chaffer*.

CHAFF-CUTTER, a name commonly given to an implement now much used by farmers for cutting hay and straw into half-inch lengths. The advantage of this consists not so much in facilitating mastication or digestion, as in preventing animals from wasting their food.

CHAFFEE, a central co. of Colorado; formed 1879; drained by the Arkansas river; 1150 sq. m., pop. '90, 6612. Co. seat, Buena Vista.

CHAF FINCH, *Fringilla cœlebs*, one of the most common British birds, a species of finch (q.v.), and probably that to which the name finch, now so extended in its signification, originally belonged; *fink*, the German form of the name, and *pink* and *twink*, English provincial forms still appropriated to the C., having some resemblance of sound to its common call-note. The whole length of the C. is about 6 inches. The tail is very slightly forked. The male, in summer, has the top of the head and nape of the neck bluish-gray; the back, chestnut; the wings almost black, with two conspicuous white bars; the tail, nearly black. The colors of the female are much duller than those of the male. The C. is a very widely distributed species, being found in almost all

parts of Europe, in some parts of Asia, in the n. of Africa, and as far w. as the Azores. In the colder northern countries, it is migratory; in more southern regions, it is stationary. Linnaeus gave it the specific name *coelebs*, from observing that the flocks congregated in winter in Sweden consisted chiefly of males, the females having, as he supposed, sought a milder climate. A partial separation of the sexes is observed also in the great winter-flocks in Britain, but it is only partial; and Yarrell thinks that the young males of the previous season, which resemble the females in plumage, are associated with them, and have been mistaken for them. The flocks seen in Britain in winter are believed to be augmented by migration from Scandinavia. The eggs are usually 4 or 5 in number, of pale purplish buff color, sparingly streaked and spotted with reddish brown. The C. feeds chiefly on insects, and does much service in summer by destroying aphides and caterpillars; but eats also seeds, and is sometimes persecuted, because in spring it pulls up and eats young turnips and radishes when in the seed-leaf. Great numbers of chaffinches are killed for the table in Italy. In Germany, this bird is in the highest esteem as a song-bird. Its notes are very clear and loud.

CHAGRES, a river entering the gulf of Darien on the n. side of the isthmus of Panama, near lat. 9° 18' north. Though, towards its mouth, it varies in depth from 16 to 30 ft., it is yet, by reason at once of its rapidity and its falls, but little available for navigation. At its entrance is a port of its own name. Both the town, however, and the stream have recently lost nearly all the advantages of their position, through the establishment of an inter-oceanic railway, which, on the Atlantic side, commences at Aspinwall, about 8 m. to the north.

CHAILLE-LONG, CHARLES, b. Md., 1840; served in the federal army during the civil war, and on the general staff of the Egyptian army, 1871-72, with rank of lieutenant-col. In 1874 he was made second in command of the force operating for the suppression of the slave trade on the White Nile, under General Charles G. Gordon. In 1874-75, he visited the country and court of Uganda, and explored the upper waters of the Victoria Nile. In 1876 he commanded the Egyptian expedition which occupied and annexed Zoulla in East Africa. In 1883 he became U. S. vice-consul at Alexandria, Egypt; and rendered important services during the Alexandria massacre, and subsequent bombardment by the English squadron, for which he received the order of the Mejidja from the Khedive. He wrote *African Travels*, *The Three Prophets* (1886), *Central Africa* (1887), etc.

CHAIN, in surveying (called Gunter's chain, from its inventor), is a measure of 22 yards long, composed of 100 iron links, each of which is thus 7.92 in. long. As an acre contains 4,840 sq. yards, 10 sq. chains ($22 \times 22 \times 10 = 4,840$ sq. yards), or 100,000 sq. links, make an acre.

CHAIN-BRIDGE. See **SUSPENSION BRIDGES**.

CHAIN-CABLE. See **CABLE**.

CHAIN-MAIL, or **CHAIN-ARMOR**, much used in the 12th and 13th centuries, consisted of hammered iron links, connected one to another into the form of a garment. Such armor was much more flexible and convenient to the wearer than that which was formed of steel or brass plates, but was less fitted to bear the thrust of a lance.

CHAINS, **HANGING IN**. In atrocious cases, it was usual for courts of justice, in former times, to direct the bodies of malefactors, after execution, to be hung in C. upon a gibbet near the spot where the crime was committed; but this, says Blackstone, "was no part of the legal judgment." The reasons commonly assigned for the practice are two: first, that it might strike terror into other offenders; and second, that it might afford "a comfortable sight to the relations and friends of the deceased." This barbarous adjunct to capital punishment was not finally abolished till a very recent period, and it may surprise our readers to learn that, two years after the passing of the reform bill, it was still in accordance with the law, if not with the custom of England.

CHAIN SNAKE, or **KING SNAKE**, an American serpent, haunting moist or shady places, and feeding upon mice, moles, small birds, and reptiles. It is remarkable for the beauty of its colors, the ground-work on the upper part of the body being a lustrous black, while the scales are marked with white spots. The head is very small.

CHAIX D'EST ANGE, GUSTAVE LOUIS VICTOR ADOLPHE CHARLES, 1800-76; a French barrister; appointed *procureur général* at the imperial court, Paris, 1857; also counselor of state and senator of the empire. In 1863 he was vice-pres. of the council of state; and in 1864 was appointed pres. of public works and fine arts. He was made a commander of the Legion of Honor, and, in 1881, a grand officer. As a commissioner of the government he presented to the senate, 1868, a report on the petition of the Rom. Catholics, demanding free superior instruction. He was also prominently engaged in the events of 1830 and 1848.

CHAJUG, or **CHIUG**, **JEHUDA BEN-DAVID**, b. about 1030; regarded by Jewish critics as the first of Hebrew grammarians. He made some very remarkable and valuable discoveries in philology.

CHALA ZA, in botany, a membrane which unites the nucleus and integuments at the base of an ovule. It is traversed by vessels which supply nourishment to the ovule. It is often of a different color from the rest of the integuments, and is conspicuous in the

ripened seed; but it is sometimes difficult to distinguish it, particularly in *orthotropal* seeds, when it is in contact with the *hilum*, the *foramen* or *micropyle* being at the opposite extremity of the seed. See OVULE and SEED.

The cords which bind the yolk-bag of an egg to the lining membrane at the two ends of the shell, and keep it near the middle as it floats in the albumen, are also called *chalazæ*. They appear to be formed of a peculiarly viscid albumen.

CHALCEDON, a city of ancient Bithynia, at the entrance of the Euxine, opposite to Byzantium. It was founded 684 B.C. by a colony from Megara, and soon became a place of considerable trade and importance. It contained several temples, one of which, dedicated to Apollo, had an oracle. C. was taken by the Persians, suffered the vicissitudes of war during the strife for Grecian supremacy between the Athenians and Lacedæmonians, and finally merged into the Roman empire. During the Mithridatic war, it was the scene of a bold exploit of the Pontic sovereign. Having invaded Bithynia, all the wealthy Romans in the district fled for refuge to C., whereupon he broke the chains that protected the port, burned four ships, and towed away the remaining sixty. Under the empire it was made a free city, and was the scene of a general council, held 451 A.D. Chosroes the Persian captured it 616 A.D., after which it declined, until it was finally demolished by the Turks, who used its ruins to build mosques and other edifices at Constantinople. C. was the birthplace of the philosopher Xenocrates.

The council of C., to which allusion has been made, was the fourth universal council, and was assembled by the emperor Marcian for the purpose of drawing up a form of doctrine in regard to the nature of Christ, which should equally avoid the errors of the Nestorians (q.v.) and Monophysites (q.v.). Six hundred bishops, almost all of the eastern or Greek church, were present. The doctrine declared to be orthodox was, that in Christ there were two natures, which could not be intermixed (this clause was directed against the Monophysites), and which also were not in entire separation (this was directed against the Nestorians), but which were so conjoined, that their union destroyed neither the peculiarity of each nature, nor the oneness of Christ's person.

CHALCEDONY (often misspelled *calcedony*), a beautiful mineral of the quartz family, or rather a variety of quartz, from which it does not differ in chemical composition or in any essential character. It derives its name from Chalcedon in Bithynia, near which it is found in considerable abundance, and has been known by the same name from ancient times. It occurs in different kinds of rock, but most frequently in old lavas and trap-rocks, and is found in almost all parts of the world where these exist, or where there are boulders derived from them. It is common in Scotland, and specimens of great beauty are brought from Iceland and the Farøe islands. It never occurs in crystals. It constitutes the whole or the principal part of many agates. It is generally translucent, sometimes semi-transparent, has not much luster, and is in color generally white or bluish white, sometimes reddish white, sometimes milk-white, less frequently gray, blue, green, yellow, brown, or even black. Its fracture is even, or very slightly conchoidal. —C. is much used in jewelry, for brooches, necklaces, and ornaments of all sorts, the largest pieces being sometimes made into little boxes, cups, etc. It was much used by the ancients, and many beautiful engraved specimens appear in antiquarian collections. Chalcedonies with disseminated spots of brown and red, were once very highly prized, and were called *stigmities* or *St. Stephen's-stones*. Petrified plants are sometimes found in C., in which they appear to have been encased whilst it was in course of formation. Specimens of C. are sometimes found enclosing a little water in the interior, which gives them a very beautiful appearance; but the water easily escapes, to prevent which, rings or other ornaments made of such stones are kept in distilled water, when not worn. The ancients set a very high value on these *enhydrites* (Gr. *en*, in, and *hydor*, water). The Vincentin was celebrated for producing them.

CHALCEDONYX (or, erroneously, *calcedonyx*), a name given to agates formed of cachelong, or a white opaque chalcedony, alternating with a grayish translucent chalcedony.

CHALCHIHUITL, a stone held in great repute by the ancient Mexicans, and still by the Indians of that country, who fashion it into ornaments and occasionally use it in trade. It is a turquoise found in the mountains not far from Santa Fé. The mines were exhausted before the coming of the Spaniards. The stone was valued by the Mexicans more highly than gold.

CHAL'CIS, a genus of Saurian reptiles, the type of a family called *chalcidæ*, some of which are popularly termed snake-lizards, because of the resemblance to snakes in the elongated form of the body, the limbs being also remarkably small, so that this family forms one of the transition links between the Saurian and the Ophidian reptiles. The scales are rectangular, and arranged in transverse bands, without being imbricated or disposed like tiles. The *chalcidæ* are natives of warm climates, both in the old and new worlds.

The name C. has also been bestowed on a genus of the order *hymenoptera*, allied to the ichneumons, which has become the type of a tribe or family, containing a vast number of species—1500 being supposed to exist in Britain—all of them of small size, many very minute, many of them very brilliant in their colors, and the larvæ of all of them parasitic

in the larvæ or pupæ, some even in the eggs, of other insects. The chrysalis of a butterfly or moth often nourishes a great number of these parasites; and they become useful in preventing the excessive multiplication of species which destroy valuable plants.

CHALCIS, the capital t. of the island and government of Eubœa, Greece, situated on the Euripus, a strait separating the island from Boeotia, and which at this point is only 120 ft. wide. The Euripus is divided into two channels, of unequal breadth and depth, by a rock, which is surmounted by a castle, partly of Venetian and partly of Turkish construction. A stone bridge, of some 70 ft. in length, connects the rock with the Boeotian shore, while a wooden and movable bridge, of about 35 ft., unites it with Chalcis. C. is a place of very great antiquity, having been founded, as tradition asserts, before the Trojan war, by an Ionian colony from Athens. Its rise was rapid. It sent out numerous colonies, and was the center of the trade of the western Mediterranean. Governed at first by an aristocracy, it fell into the hands of the Athenians, who in 506 B.C. divided the lands of C. amongst some of their own number. It subsequently fell under the power of the Macedonians and Romans, and was at this time a place of great military importance, nearly 9 m. in circumference, and had many fine temples, theaters, and other public buildings. Aristotle died at Chalcis. In the middle ages, it was prosperous under the Venetians, who held it for nearly three centuries, until its conquest by the Turks in 1470. The lion of St. Mark is, or was until within recent years, still to be seen over the gateway between the bridge and the citadel. Not many ancient remains now exist at Chalcis. The streets are narrow, but the houses, many of which owe their origin to the Venetians, are substantial and spacious. It suffered from an earthquake in 1894. Pop. about 9900.

CHALCOGRAPHY, a pedantic term used to signify engraving on copper, compounded of the Greek words *chalkos*, brass or copper, and *grapho*, I write. The term is inaccurate when applied, as it often is, to engraving on other metals, such as steel and zinc. For zinc-engraving the still more objectionable word *zincography* has been invented.

CHALDÆA. See BABYLON, BABYLONIA.

CHALDÆAN CHRISTIANS, a branch of Nestorians who acknowledge the pope of Rome. They use the eastern rite, and are under the patriarch of Babylon. They are supposed to number about 70,000. See NESTORIANS.

CHALDEE. See ARAMÆA.

CHALDER, an old Scotch dry measure, containing 16 bolls. See BOLL.

CHALDRON (Lat. *caldarium*, a vessel for warm water), an old dry measure used in selling coal, and containing 36 heaped bushels. Coal is now sold by weight.

CHALET is the French-Swiss name for the wooden summer hut of the Swiss herdsmen on the mountains, but the term is also extended to include Swiss houses generally, and picturesque and ornate villas built in imitation of them.

CHALEUR BAY, an inlet of the gulf of St. Lawrence, between Gaspé, a district of Lower Canada, and New Brunswick, having a depth of 90 m. from e. to w., and a width varying from 12 to 20. The Restigouche, which enters the gulf from New Brunswick at its very head, marks, at its mouth, the interprovincial boundary.

CHALICE (Lat. *calix*, a cup). This ancient name for an ordinary drinking-cup has been retained for the vessels used for the wine in the holy sacrament. Chalices are commonly made of silver, but it was not unusual for them to be of gold, or gilt and jeweled. Chalices were also made of glass, crystal, and agate; but these substances have been abandoned, in consequence of their fragile nature. The C. is the attribute of St. John the evangelist.

CHALK, a soft earthy variety of limestone or carbonate of lime, forming great strata, and claiming the attention of the geologist even more than of the mineralogist. It is generally of a yellowish-white color, but sometimes snow-white. It is easily broken, and has an earthy fracture, is rough and very meager to the touch, and adheres slightly to the tongue. It generally contains a little silica, alumina, or magnesia, sometimes all of these. Although often very soft and earthy, it is sometimes so compact that it can be used as a building-stone; and it is used for this purpose either in a rough state, or sawn into blocks of proper shape and size. It is burned into quicklime, and nearly all the houses in London are cemented with mortar so procured. The siliceous particles being separated by pounding and diffusing in water, it becomes whiting, of which the domestic uses are familiar to every one. Carpenters and others use it for making marks, which are easily effaced: the *blackboard* and piece of C. are now common equally in the lecture-rooms of universities and in the humblest village-schools. C., perfectly purified, is mixed with vegetable coloring matters, such as turmeric, litmus, saffron, and sap green, to form pastil colors; but vegetable colors which contain an acid are changed by it. See CRAYON. The *Vienna white* of artists is simply purified chalk. In a perfectly purified state, it is administered as a medicine, to correct acidity in the stomach. C. is also extensively used as a manure. See LIME, as a manure.

CHALK, BLACK, is a mineral quite different from common chalk, and apparently receives its name from resembling it in meagerness to the touch, in soiling the fingers,

and in being used for drawing, writing, etc. It is also called **DRAWING-SLATE**. It is of a slaty structure, of a bluish or grayish-black color, easily cut and broken, and makes a perfectly black mark on paper. It is used for drawing, and as a black color in painting. It becomes red by exposure to heat. It is essentially a kind of clay (q.v.), and derives its color from carbon, which it contains. It is found in primitive mountains, in Spain, France, Italy, etc., also in the coal formation in Scotland.—**BRIANÇON CHALK** and **FRENCH CHALK** are popular names for soapstone.—**RED CHALK** is *ochery red clay-iron-ore*, consisting of clay and much peroxide of iron. It is of a brownish-red color, and a somewhat slaty structure, the cross fracture earthy. The coarser varieties are used chiefly by carpenters for making marks on wood; the finer, by painters. It occurs in thin beds in clay-slate and grauwacke-slate in some parts of Germany.

CHALK-BEDS. See CRETACEOUS GROUP.

CHALKING THE DOOR, a mode of warning tenants to remove from burghal tenements, long known and still in use in Scotland. The practice is thus described by Mr. Hunter in his valuable work on Landlord and Tenant: "A burgh-officer, in presence of witnesses, chalks the most patent door forty days before Whitsunday, which is held to be a legal warning. There is no execution at the parish church, but the officer makes out an execution of 'chalking,' in which his name must be inserted, and which must be subscribed by himself and two witnesses. This ceremony now proceeds simply on the verbal order of the proprietor, but anciently the interposition of a judge was requisite. In such a case, authority was given by one of the magistrates to the burgh-officer."

CHALKLEY, THOMAS, 1675-1741; a Quaker preacher, native of London. He came to America in 1698, and traveled in Virginia, Maryland, and the New England colonies. Returning to England, he married, and soon afterwards came back and settled in Philadelphia. Again he crossed the sea and traveled in Holland and Germany; thence he went to the West Indies, where he died while engaged in missionary work. In his will he founded the library of the four monthly meetings of Friends in Philadelphia. His journal of his life and labors was published in 1747.

CHALKY ISLAND, in New Zealand, near the s.w. extremity of Middle Island, about lat. 46° s., and long. 166° 20' east. It takes its name from being composed of a mass of white limestone, and imparts the same to the adjacent bay of 16 m. in length, and also to one of the harbors of the inlet.

CHALLEMEL-LACOUR, PAUL-AMAND, 1827-96. He was prof. of philology at Pau, France, when only 22 years of age; was a brilliant journalist, and with Targé and Ranc founded the *République Française*, the great liberal paper of Paris. He was a noted republican, and a strenuous opponent of the second empire, having been banished as early as 1852 for his political opinions. He translated Ritter's *History of Philosophy*, and edited the works of Madame d'Épinay; was prefect of the Rhone, commissioner extraordinary for the Republic during the Franco-Prussian war, ambassador to Great Britain in 1880-82, minister of foreign affairs in 1883, re-elected senator in 1885, and became president of the senate in 1893.

CHALLENGER EXPEDITION, a scientific exploration of the open sea sent out by the British Government in 1872-76. In 1872, the *Challenger*, a corvette of 2306 tons, was completely fitted out and furnished with every scientific appliance for examining the sea from surface to bottom, e.g., with natural history work-room, chemical laboratory and aquarium. The ship was placed in charge of a naval surveying staff under Captain Nares and of a scientific staff, with Professor Wyville Thomson at their head, for the purpose of sounding the depths, mapping the basins, and determining the physical and biological conditions of the Atlantic, the Southern and Pacific Oceans. The *Challenger* weighed anchor at Sheerness on December 7, 1872, and on May 24, 1876, dropped anchor at Spithead, having in these three and a half years cruised over 68,900 nautical miles. Investigations were made at 362 stations, at each of which were determined the depth of channel, the bottom, surface and intermediate temperatures, currents, and fauna, and the atmospheric and meteorological conditions. The route was by Madeira, the Canaries, the West Indies, Nova Scotia, Bermudas, Azores, Cape Verd, Fernando Noronha, Bahia, Tristan d'Acunha, Cape of Good Hope, Kerguelen, Melbourne, the Chinese Sea, Hong Kong, Japan, Valparaiso, Straits of Magellan, Montevideo, Vigo, and Portsmouth. Between the Admiralty Islands and Japan the *Challenger* made her deepest sounding, 4575 fathoms, the deepest sounding on record except two. See the copious *Reports on the Scientific Results of the Voyage of H. M. S. Challenger*, edited by Sir Wyville Thomson and Dr. John Murray. They fall into a *Narrative* (2 vols., 1882-85), *Zoology* (30 vols., 1880-89), *Physics and Chemistry* (3 vols., 1884-89), *Botany* (2 vols., 1885-86).

CHALONER, RICHARD, 1691-1781; the son of an English dissenter, but brought up among Roman Catholics, whose religion he embraced. He was ordained a priest at Douay, and made professor in the faculty. In 1730, he held the English mission in London, where he published several religious works. In 1758, he became vicar apostolic, residing generally in London; but during the "No Popery" riots of 1780, he retired into the country. He was the author of numerous controversial and devotional works.

the most popular one being *The Garden of the Soul*, which has been frequently reprinted, and translated into various languages. He revised the Douay Bible (in English); and as an antidote to Foxe's well-known *Martyrology*, he wrote *Memoirs of Missionary Priests and Other Catholics of both Sexes, who suffered Death or Imprisonment in England on Account of their Religion*.

CHALMERS, ALEXANDER, 1759-1834, Scottish editor and author; compiled the *General Biographical Dictionary* in 32 vols. (1812-19); edited *British Essayists*, in 45 vols.

CHALMERS, GEORGE, an eminent historical antiquary, was b. at Fochabers, Morayshire, Scotland, in 1742. Having attended King's college, Aberdeen, and afterwards studied law at Edinburgh, he went in 1763 to North America, where he practiced as a lawyer till the breaking out of the war of independence. Being a keen loyalist, he returned to Britain, where he was appointed clerk to the board of trade in 1786. The duties of this office he continued to discharge with diligence and ability till his death in 1825. Before his appointment, he had distinguished himself by various publications in political economy; and for some time after he devoted himself chiefly to editing the works of various authors and writing biographies. His great work is his *Caledonia; an Account, Historical and Topographical, of North Britain*; a production displaying profound research into the history of Scotland, and abounding in varied erudition.

CHALMERS, JAMES RONALDS, American politician, b. Va., 1831; removed to Miss., 1839; was a general in the confederate army, and was afterwards several times elected to Congress, but was deprived of his seat in the XLVIIIth congress, and was deprived of his certificate of election to the XLVIIIth congress,—as he claimed, illegally.

CHALMERS, THOMAS, D.D., LL.D., was b. at Anstruther, in Fifeshire, 17th Mar., 1780, educated at the university of St. Andrews, and in his 19th year licensed to preach the gospel. In 1803, he was ordained minister of the parish of Kilmarny, in Fifeshire, about 9 m. from St. Andrews. At this period his attention was entirely absorbed by mathematics and natural philosophy, to the neglect of the studies appertaining to his profession. To gratify his love of scientific pursuits, he even formed mathematical and chemistry classes in St. Andrews during the winter of 1803-04, and by his wonderful enthusiasm and lucidity of exposition excited intense interest, and obtained for himself a great reputation. In 1808, he published an *Inquiry into the Extent and Stability of National Resources*, which proved his capacity for dealing with questions of political economy. Shortly after this, certain domestic calamities, and a severe illness of his own, opened up the fountains of his soul, and rendered him keenly susceptible to religious impressions. Having to prepare an article on Christianity for Brewster's *Edinburgh Encyclopedia*, he commenced an extensive study of the evidences, and rose from his investigations convinced that Christianity was a *fact*, and the Bible the veritable "word of God." Then the great genius of the man broke forth like sunshine. He grew earnest, eloquent, devout, and faithful to his pastoral duties. In July, 1815, he was translated to the Tron church and parish, Glasgow, where his magnificent oratory took the city by storm. His *Astronomical Discourses* were probably the most sublimely intellectual and imaginative that had ever been preached in a Scottish pulpit. They were published in 1817, and had a prodigious popularity. During the same year he visited London, where his preaching excited as great a sensation as at home. But C.'s energies could not be exhausted by mere oratory. Discovering that his parish was in a state of great ignorance and immorality, he began to devise a scheme for overtaking and checking the alarming evil. It seemed to him that the only means by which this could be accomplished was by "revivifying, remodeling, and extending the old parochial economy of Scotland," which had proved so fruitful of good in the rural parishes. In order to wrestle more closely with the ignorance and vice of Glasgow, C., in 1819, became minister of St. John's parish, "the population of which was made up principally of weavers, laborers, factory-workers, and other operatives." "Of its 2,000 families," says Dr. Hanna, "more than 800 had no connection with any Christian church, while the number of its uneducated children was countless." We have not space to narrate at length how vast and successful were the labors of Chalmers. It is sufficient to say, that in pursuance of his favorite plan, he broke up his parish into 25 districts, each of which he placed under separate management, and established two week-day schools, and between 40 and 50 local Sabbath-schools, for the instruction of the children of the "poorer and neglected classes," more than 1000 of whom attended. In a multitude of other ways he sought to elevate and purify the lives of his parishioners.

But such herculean toils began to undermine his constitution, and in 1823 he accepted the offer of the moral philosophy chair in St. Andrews, where he wrote his treatise on the *Use and Abuse of Literary and Ecclesiastical Endowments* (1827). In the following year he was transferred to the chair of theology in Edinburgh, and in 1832 published a work on political economy. In 1833 appeared his Bridgewater treatise, *On the Adaptation of External Nature to the Moral and Intellectual Constitution of Man*. It was received with great favor, and obtained for the author many literary honors; the Royal Society of Edinburgh electing him a fellow, and the French Institute a corresponding member, while the university of Oxford conferred on him the degree of D.C.L. In 1834, he was appointed convener of the church-extension committee; and after seven years of enthusiastic labor, announced that upwards of £300,000 had been collected from the nation, and 220 new churches built. Meanwhile, however, troubles were springing up in the bosom of the church itself. The evangelical party had become predominant in the gen-

eral assembly, and came forward as the vindicators of popular rights; the struggles in regard to patronage between them and the "moderate" or "Erastian" party became keener and more frequent, until the decision of the civil courts in the famous "Auchterarder and Strathbogie" cases brought matters to a crisis; and on the 18th of May, 1843, C., followed by 470 clergymen, left the church of his fathers, rather than sacrifice those principles which he believed essential to the purity, honor, and independence of the church. See FREE CHURCH. The rapid formation and organization of the Free Church were greatly owing to his indefatigable exertions, in consequence of which he was elected principal of the Free Church College, and spent the close of his life in the zealous performance of his learned duties, and in perfecting his *Institutes of Theology*. He died suddenly at Morningside, Edinburgh, May 30, 1847.

This is not the place for a criticism on the works of C., which extend to more than 30 volumes. It is sufficient to say, that they contain valuable and, in some cases, original contributions to the sciences of natural theology, Christian apologetics, and political economy; while on minor topics, such as the church-establishment question, they exhibit both novelty and ingenuity of argument. As an orator, C. was unique and unrivaled. We read of men, in the history of the Christian church, whom we can believe to have been as eloquent, impassioned, and earnest, but nowhere do we encounter a man in whom intellect, feeling, and imagination were so harmoniously combined—a nature so "nobly planned, to warn, to comfort, and command." Scotland never produced a greater or more lovable soul, one more gentle, guileless, genial-hearted, or yet more fervid, from the strength of a resolute and irresistible will, before whose impetus difficulties were dashed aside as by a torrent. There have been some loftier and more purely original minds in Scotland than C.'s, but there has never been a truer one, nor a heart whose Christian faith and piety were more intense, sincere, and humane.

CHÂLONS-SUR-MARNE, a t. of France, in the department of Marne, 107 m. e. of Paris by railway. It stands on the right bank of the river Marne, which is here crossed by a handsome stone bridge. C. is old; and the houses consist chiefly of timber, lath, and plaster. The situation, however, is agreeable, and the town contains some fine public buildings, the principal of which is the cathedral, in the sanctuary of which there is one of the finest grand altars in France. On the east side of the town there is the splendid *Promenade du Jard*, or park, which covers 19 acres. C. has manufactures of woollens, cotton, leather, etc., and a considerable trade in grain, hemp, rape-seed oil, and Champagne wine. Pop. '91, 25,863. Previous to the union of Champagne with France in 1284, the population numbered about 60,000. In 1856, Napoleon III. formed the celebrated camp of C. to the n.e. of the town, which was occupied during the Franco-Prussian war by Canrobert, and afterwards by MacMahon. On the night of Aug. 21, 1870, MacMahon withdrew his troops; and next day the town was occupied by the Germans.

CHÂLON-SUR-SAÔNE, a t. of France, in the department of Saône-et-Loire, about 33 m. n. of Mâcon. It is situated on the right bank of the Saône, at the point where that river is joined by the Canal-du-Centre, which unites the Saône with the Loire, and secures C. an extensive traffic with the central districts of France, as well as with the Mediterranean and Atlantic. The town is generally well built, good quays line the river, along which also the finest houses extend. Vineyards, wood, meadows, and cultivated fields surround and add variety and beauty to the situation. Its manufactures include hats, hosiery, vinegar, oil, pottery, jewelry, and imitation pearls; and it has a large trade in the agricultural and other produce of the district. Steamboats navigate the Saône from C. downwards. Pop. '91, 24,686. C. occupies the site of the ancient *Cabillonum* or *Caballinum*.

CHALOTAIS, LA, LOUIS RENÉ DE CARADEUC, 1701-85; procureur-general of the parliament of Brittany, where he was a decided opponent of Jesuits. Grimm asserts that Chalotais's reports led to the suppression of the Jesuits in France. Voltaire gave C. high praise for his essay on national education. Later in life he was subjected to long political persecution, but was finally found free of blame, and resumed his place in the parliament at Rennes.

CHALYBÆUS, a genus of birds very closely allied to the baritahs (q.v.), but having a rather thicker bill, and the nostrils pierced in a broad membranous space. The species are natives of New Guinea, and are birds of the most beautiful plumage, remarkable for the brilliancy of their metallic tints, and particularly for the resemblance to burnished steel, to which they owe their name (Gr. *chalybs*, *-ybos*, steel). On this account, they are sometimes included under the name of birds of paradise; and the skin of *C. paradisæus*, deprived of its feet, is sold as that of a bird of paradise.

CHALYBÆUS, HEINRICH MORITZ, a German philosopher, was b. 3d July, 1796, at Paffroda, in Saxony, and educated at Leipsic. After spending some years in teaching, he was appointed in 1839 professor of philosophy in the university of Kiel, where he remained till his death in 1862. His chief works are the *Historische Entwicklung der speculativen Philosophie von Kant bis Hegel* (1836—English translations by Edersheim and Tulk); *System der speculativen Ethik* (1850); *Philosophie und Christenthum* (1853); and *Fundamental Philosophie* (1861).

CHALYBEATE WATERS are those which contain a considerable portion of iron in solution. They are of two kinds, *carbonated* and *sulphated*. The *carbonated C. W.* contain carbonate of iron, FeO, CO_2 , dissolved in excess of carbonic acid, and may be recognized by forming an ochrey deposit of red oxide of iron (Fe_2O_3) on the surface of the stones near the mouths of the springs, owing to the escape of the carbonic acid on exposure to the air. Islington Spa near London, Tunbridge Wells, and Oddy's Saline C. W. at Harrogate, are examples of this class. Where an excess of carbonic acid is present, communicating a sparkling aspect to the water and an acidulous taste, as at Pyrmont and other places, the term *acidulo-chalybeate* or *acidulo-ferruginous* is applied. The *sulphated C. W.* contain sulphate of iron FeO, SO_3 , dissolved in them, and examples of this class are afforded at the Isle of Wight (the Sand Rock spring), Vicars bridge, Moffat, etc. C. W. are characterized by a more or less inky or styptic taste; by becoming of a purplish black tint when infusion of galls or tea, and some varieties of wine, are added; and by giving a pale blue color on the addition of a few drops of ferrocyanide of potassium (yellow prussiate of potash). C. W. are of great service in cases of debility, and the *acidulo-carbonated* kind being lighter on the stomach, is generally preferred; but all C. W. are to be avoided in plethoric, febrile, and inflammatory conditions of the system. See **MINERAL WATERS**.

CHALYBITE. See **IRON**.

CHAM, or **AMÉDÉE DE NOÉ**, 1819-79; b. Paris; the son of a former peer of France; he was intended for the polytechnic school, but preferring painting he studied with Paul Delaroche, and afterwards with M. Charlet, where he developed a talent for the grotesque. Beginning in 1842, he contributed, chiefly to *Charivari* (the *Punch* of France), an immense number of caricatures, and some sketches, under the signature of "Cham." His political cartoons are singularly sharp and effective. He also produced many vaudevilles.

CHAMA, a genus of lamellibranchiate mollusks. The shell consists of two unequal valves, having two hinge-teeth in the one valve, and one in the other. The general form of the shell approaches to orbicular. The shell is generally thick, and is foliated with leaf-like projections, which arise in a somewhat regular manner from its surface; these and the colors of some of the species combining to make them very beautiful. The shells of the *chamæ* are often called *clams* or *clump* shells, a name which they share with some of the *pectens*, *spondyli*, etc. They are found only in the seas of warm climates, none further n. than the Mediterranean. The Linnean genus *C.* contained many species now removed to other families, but the restricted genus *C.* is the type of a family *chamidae*. Thirty fossil species have been referred to *C.*

CHAMADE. See **PARLEY**.

CHAMÆROPS, a genus of palms, with fan-shaped leaves, less exclusively tropical than palms are in general, and of which one species, *C. humilis*, is the only palm truly indigenous to Europe. It extends as far n. as to the neighborhood of Nice. It is sometimes called the **PALMETTO**. The flowers are in spathes about 6 to 8 in. long; the fruit is a triple blackish spongy drupe, which is eaten, as are also the young shoots. This palm is so tolerant of a cold climate, that a specimen has lived in the open air in the botanic garden of Edinburgh for more than 50 years, with the protection of matting in very severe winters. In its native regions, the leaves are much used for thatching, and for making brooms, hats, chair-bottoms, etc. They abound in an excellent fiber, which the Arabs mix with camel's hair, and make into tent covers: cordage, and sometimes sail-cloth, are made of it in Spain; it is imported into France, and used for making carpets, under the name of *African hair*. The French in Algeria make paper and pasteboard of it; and it is supposed that it may prove a valuable commercial commodity, as a material for paper-making.—Other species of the genus abundant in India, China, etc., serve similar purposes, and deserve attention in connection with paper.—To this genus belongs also the West Indian palm, which yields the material for chip hats (see **BRAZILIAN GRASS**); and the palmetto (q.v.) of North America is by some botanists referred to it.

CHAMALARI, a peak of the Himalaya between Thibet and Botan, in lat. $28^{\circ} 4' \text{ n.}$, and long. 90° e. , said to have an elevation of 27,200 ft., or more than 5 m. and a furlong.

CHAMBA, a feudatory state of n. India, subordinate to the Punjab government, between 32° and $33^{\circ} 9' \text{ n.}$, and $75^{\circ} 54'$ and $76^{\circ} 30' \text{ east}$. A range of mountains separate C. from Kashmir. C. is about 65 by 50 m. in length and breadth; pop. '91, 124,032. The agricultural products are wheat, Indian corn, rice, hops and millet. Iron ore is found, and there are slate quarries.

CHAMBER, of a piece of artillery, or small arm, is a contracted part of the bore, at the breech end. The C. contains the charge of powder, but is too small to contain the shot or shell. Some of these cavities are spherical, some cylindrical, some conical with a hemispherical termination, and some pear-shaped. Carronades and shell guns are usually chambered. The charge just fits the C., and the ball or shell comes in contact with it. Chambered guns are slow to load and fire.

CHAMBER-MUSIC, a term to designate music that is specially adapted for performance in a room. The name originally comprised both vocal and instrumental music, but it is now almost restricted to the various combinations of the pianoforte with strings or

strings alone, as duos, trios, quartets, quintets, etc. Beethoven has left some of his greatest thoughts in his string quartets.

CHAMBER OF COMMERCE, a body of merchants and traders, associated for the purpose of promoting the interests of its own members, of the town or district to which the society belongs, and of the community generally, in so far as these have reference to trade and merchandise. Of the means by which these objects are sought to be accomplished, the following may be mentioned as the most prominent: 1. By representing and urging on the legislature the views of their members in mercantile affairs; 2. By aiding in the preparation of legislative measures having reference to trade, such, for example, as the bankrupt acts; 3. By collecting statistics bearing upon the staple trade of the district; 4. In some places, by acting as a sort of court of arbitration in mercantile questions; 5. By attaining by combination advantages in trade which might be beyond the reach of individual enterprise.

These institutions are of continental origin, and, like so many others which England has borrowed from that source, were first introduced into Scotland. The oldest C. of C. in France is that of Marseilles, which dates from the end of the 14th or commencement of the 15th century. This chamber was invested with very remarkable powers. It shared in the municipal jurisdiction, and in the administration of justice in mercantile questions. It was several times suppressed and re-established, and it was not till 1650 that its powers were fixed, and that it received its ultimate organization. The second chamber in France was that of Dunkerque, which was established in 1700. The same year a council-general of commerce was instituted at Paris, which, in addition to six councillors of state, consisted of twelve merchants or traders, delegated by the principal commercial towns of the kingdom, an arrangement which led within the next few years to the formation of chambers of commerce everywhere in France. We thus find that the chamber at Lyon was instituted in 1702, those of Rouen and Toulouse in 1703, of Montpellier in 1704, of Bordeaux in 1705, etc. By an order of council of Aug. 30, 1702, a direct relation was established between these various chambers and the central council of commerce. These chambers were all suppressed by a decree of the national assembly in 1791, but they were re-established by a consular edict in 1802, which fixed the population of the towns in which they might be established, and the number of their members, who were to be chosen from amongst the merchants who had carried on trade in person for a period of not less than ten years. Sixty of the best known merchants, presided over by the prefect or the maire, were charged to elect the members of these new chambers. They then presented to the government two candidates for the office of member of the general council of commerce, instituted at Paris under the minister of the interior. This organization was again modified in 1832, and still later by the ordinances of Sept., 1851, and Aug., 1852, by which these bodies are now regulated. In accordance with that decree, the members of these bodies are now elected by the chief merchants of each town chosen for that purpose by the prefect. Their number cannot be less than 9, nor more than 21. They hold office for six years.

The oldest C. of C. in Great Britain is believed to be that of Glasgow, which was instituted 1st Jan., 1783, and obtained a royal charter, which was registered at Edinburgh on the 31st of the same month. That of Edinburgh was instituted in 1785, and incorporated by royal charter in 1786. The Edinburgh C. of C. was the first public body which petitioned for the abolition of the corn laws, and the adoption of free-trade principles; and stood almost alone in the United Kingdom in advocating the Suez canal project. It also originated the movement that government should undertake the telegraph service in connection with the post-office. Six hundred of the bankers, merchants, and ship-owners of Edinburgh and Leith constitute the chamber. The Manchester chamber, since so famous for its exertions in the cause of free-trade, was not established till 1820, and for many years it continued to be the only institution of the kind in England. Its members number about 400. In Hull there has been a C. of C. since 1837, but those of Liverpool, Leeds, and Bradford, notwithstanding the great trading and manufacturing interests of these towns, were not established till 1850, in which year, strangely enough, a similar institution was established in s. Australia. The Liverpool C. of C. numbers nearly 600. The annual income of the Manchester chamber is upwards of £600, that of Liverpool about £800, contributed entirely by the subscriptions of members, amounting generally to £11s. a year. There are now chambers of commerce in all the great mercantile towns of Great Britain and Ireland, and in 1860 there was established an "Association of Chambers of Commerce of the United Kingdom." In Canada, there is a Dominion Board of Trade, which consists of the chambers of commerce, or boards of trade, as they are indifferently called, of a dozen important Canadian cities. The Chamber of Commerce of New York city is the oldest existing institution of the kind in America, organized in 1768, and incorporated by royal charter Mar. 13, 1770, under the name of *The Corporation of the Chamber of Commerce of the City of New York in America*. When the state government was established the charter was renewed by the legislature. It was composed at first of 24 of the most prominent merchants of the city, who established an exchange which has been ever since kept up, though not recently under control of the body. The objects of the Chamber of Commerce are to encourage and promote commerce, support industry, adjust disputes relative to trade, and procure such laws and regulations as may be found necessary for the benefit of trade in general. The membership is about 800,

including nearly all the leading merchants, financiers, and business men of the city. Several years ago a court of arbitration was established, by which differences between members are adjusted, and much litigation in courts avoided. Meetings are held once a month. In the rooms of the Chamber is a vast collection of commercial statistics, and many portraits of merchants.

CHAMBERLAIN, DANIEL HENRY, b. West Brookfield, Mass., 1835; graduated at Yale coll., and at the Harvard law school; entered the union army and served until 1865, principally on staff duty. He settled in Charleston, S. C.; was a member of the state constitutional convention, 1867-68; atty.-gen. 1868-72; and gov. 1874-76. He was inaugurated a second time, but his election was successfully contested, and he relinquished his office, 1877, and removed to New York to practice his profession. He has written for the *North American Review*.

CHAMBERLAIN, JOSEPH, P.C., M.P., English statesman, was born in London in 1836, was educated at University College, and during early life was a manufacturer in Birmingham. His introduction to public life was in 1870; he was thrice elected mayor of Birmingham, and since 1876 has represented that town in parliament. His advocacy of disestablishment, and of compulsory secular education and other radical measures, made him conspicuous, and he was for a time (1886) in Gladstone's cabinet, as president of the local government board, but resigned because of opposition to Gladstone's home-rule measures. He was appointed British commissioner to the conference at Washington for the settlement of the fisheries dispute between the United States and Canada (1888), in that year married Miss Endicott, daughter of the secretary of war under President Cleveland, and became secretary of state for the colonies in the Salisbury ministry in 1895.

CHAMBERLAIN, LORD, or King's C., as he was formerly called, has been one of the English officers of state from very early times, and for centuries he was an influential member of the government. He has the function of indorsing the king's answer on petitions presented to him, and very often of communicating his majesty's pleasure to parliament and to the council. He was always a member of the council himself, *ex officio*. Though he has long ceased to have any share in the responsibilities of government, the C. is still an officer of very high standing in the royal household. He has control over all the officers and servants of the royal chambers, except those of the bedchamber, over the establishment attached to the chapel royal, the physicians, surgeons, and apothecaries of the household. The C. has further the oversight of the queen's musicians, comedians, trumpeters, messengers, etc.; and all tradesmen and artificers in her service are appointed by him. When the office of keeper of the great wardrobe was abolished in 1783, the duties of providing the state-robcs of the royal family, the household, and officers of state, devolved on the lord chamberlain. All theaters in towns in which a royal palace is situated, require to be licensed by the Lord C., and no new play can be performed anywhere without his license. All persons desiring to be presented at levees or drawing-rooms, require to send their cards to the Lord C., and it is his duty to see that the persons thus applying are entitled by station and character to be presented to the queen. The C. also issues her majesty's invitations to balls, parties, etc. In accordance with ancient custom, the Lord C. is still a member of the privy council. His salary is £2,000 a year, but his tenure of office depends on that of the political party to which he belongs.

The *Vice-chamberlain* is the deputy and assistant of the Lord C., and in his absence exercises the full authority which belongs to his principal. His office existed in the time of Richard II. He is also dependent on the administration, and is usually a member of the privy council. His salary is £924 per annum.

CHAMBERLAIN, THE LORD GREAT, is a hereditary officer of great antiquity, and formerly of great importance. He has the government of the palace at Westminster, and, upon solemn occasions, the keys of Westminster hall and of the court of requests are delivered to him. At these times, the gentleman usher of the black rod, the yeoman usher, and the doorkeepers, are under his orders. At coronations, state-trials, banquets, and the like, the fitting-up of the hall devolves on him. When the queen goes to parliament, he delivers the sword of state to any member of the administration whom he chooses, to be borne before her majesty, he himself walking on her right hand. During the sitting of parliament, he has charge of the house of lords, and issues tickets of admission on the opening or prorogation of parliament. Some fees and perquisites belong to him. This office, conferred by Henry I. on Alberic de Vere, was inherited by female succession from the De Veres, earls of Oxford, by the Berties, and is now held conjointly by lady Willoughby de Eresby and the marquis of Cholmondeley, in right of their mothers, sisters and co-heirs of Robert, fourth duke of Ancaster. They discharge the duties alternately in each succeeding reign, a lady acting by deputy.

CHAMBERLAIN, JOSHUA LAWRENCE, LL.D., b. Me., 1828; a graduate of Bowdoin college. During the civil war he served with distinction, was six times wounded, and left the service with the rank of maj.-gen. From 1866 to 1870, he was governor of Maine, and in 1871 was chosen President of Bowdoin college. When the democrats and fusionists, under the lead of Gov. Garcelon, in 1879-80 undertook to get possession of the state government, and there was some danger of civil war, C. was major-general of the militia of the state. He adhered to the regularly elected legislature, as sustained by the unanimous opinion of the supreme court, and prevented the intended violence and usurpation. He resigned the presidency of Bowdoin college in 1883, and removed to New York to practice.

CHAMBERLIN, THOMAS CROWDER, LL.D., geologist; b. Mattoon, Ill., 1843; educated at Beloit college and the University of Michigan; became professor of geology at Beloit; president of the University of Wisconsin 1887-92; dean of the scientific faculty, University of Chicago, 1892. He also became chief geologist of Wisconsin, had charge of the glacial division of the U. S. geological survey, and was author of numerous monographs published by the government.

CHAMBERS, PRACTICE BEFORE A JUDGE OR VICE-CHANCELLOR AT. It is to applications to the court *in banc* alone that the name of motions is properly given. But there are certain matters of subordinate importance, regarding which applications are made to a single judge at chambers, who decides in a summary way on the pleadings.

CHAMBERS, a co. in e. Alabama, on the Georgia border, intersected by three lines of railroad. Before a division was made to form Lee co., the area was 775 sq. m. It is now 610; pop. '90, 26,319. It is partly bounded by the Chattahoochee river, and is intersected by the Tallapoosa. Productions, cotton, corn, wheat, sweet potatoes, peaches, and timber. Co. seat, Lafayette.

CHAMBERS, a co. in s.e. Texas, on the gulf of Mexico, bounded on the w. by Galveston bay, and intersected by Trinity river; 840 sq.m.; pop. '90, 2241, with colored. The surface is mainly prairie; productions, corn, cotton, and sweet potatoes. Co. seat, Wallisville.

CHAMBERS, EPHRAIM, the compiler of the first English encyclopædia. He was b. at Kendal in the latter part of the 17th c., and began life as an apprentice to a globe-maker in London, where he conceived the idea of his encyclopædia. The first edition of the work, in 2 vols. folio, appeared in 1728; ten years later, the 2d appeared; and in the year following, the 3d. The 4th was issued in 1741, a year after the editor's death. A 5th appeared in 1746, and a 6th, with new matter, in 1750. This work forms the basis of Dr. Rees's Cyclopædia in 45 quarto vols., and may be considered as the forerunner of the now countless publications of an encyclopædic character (see ENCYCLOPÆDIA).

CHAMBERS, GEORGE, 1803-40; an English painter. When a boy he followed the sea, where he made sketches of vessels, which so pleased his master that he canceled the boy's indentures. C. then apprenticed himself to an old woman who kept a paint-shop, and began house-painting. Finally he got employment as assistant in painting the panorama of London for the Colosseum, and then became scene-painter in a theater. His best works are naval battles, such as "The Bombardment of Algiers," and "The Capture of Porto Bello," both in the Greenwich Hospital.

CHAMBERS, WILLIAM and ROBERT, the editors and publishers of the *Encyclopædia* and other works; b. at Peebles, W. in 1800, R. in 1802. Bearing up against the difficulties of his early life, W. C. began business as a bookseller in Edinburgh, 1819; afterwards adding printing to his business. Between 1825 and 1830, he wrote the *Gazetteer of Scotland*, 1 vol.; and the *Book of Scotland*, 1 vol. R. C. also began business as a bookseller in Edinburgh, and from 1823 to 1830 wrote successively the *Traditions of Edinburgh*, 2 vols.; *Popular Rhymes of Scotland*, 1 vol.; *Picture of Scotland*, 2 vols.; and *Histories of Rebellions in Scotland, and Life of James I.*, 5 vols. Next, he edited *Scottish Ballads and Songs*, 3 vols.; and *Biography of Distinguished Scotchmen*, 4 vols. His *Traditions of Edinburgh* procured him the friendship of sir Walter Scott, who contributed various memoranda for the work. W. C. projected *Chambers's Edinburgh Journal*, and that periodical was commenced on the 4th of Feb., 1832, about six weeks in advance of the *Penny Magazine*, and may be considered the pioneer of that class of cheap and popular periodicals of a wholesome kind now so generally diffused. The success of the *Journal* was materially promoted by the essays, moral and humorous, of R. C., who from the first was an able collaborateur. United from this period in the peculiar profession of writing, editing, printing, and publishing, W. and R. C. issued a series of works designed for popular instruction, including the *Journal*. Among these works are *Chambers's Information for the People*, 2 vols.; *Chambers's Educational Course*, 250 vols.; *Cyclopædia of English Literature*, 2 vols.; *Miscellany of Useful and Entertaining Tracts*, 20 vols.; *Papers for the People*, 12 vols.; and the present *Encyclopædia*, 10 vols. In conducting these laborious undertakings they necessarily depended on a number of accomplished literary assistants. In 1849, W. C. acquired the estate of Glenormiston in Peeblesshire, and a few years afterwards he founded and endowed an *Institution* in his native town for purposes of social improvement (see PEEBLESHIRE). His later productions are—*Things as they are in America*, 1 vol. (the result of a visit to the United States in 1853); the *Youth's Companion*, and *Counselor*, 1 vol.; *History of Peeblesshire*, 1 vol. 8vo (1864); pamphlets on *Improved Dwellings and Co-operation among the Working Classes*; *Wintering at Mentone*, written from personal knowledge of the place during two successive visits; *France: its History and Revolutions*, 1 vol (1871); *Memoir of Robert Chambers, with Autobiographic Reminiscences*; and *Albie Gilroy*, a story. More lately, *Stories of Remarkable Persons, Stories of Old Families*, and the *Story of St. Giles'* (1879). Twice elected lord provost of Edinburgh, W. C. occupied that office for four years (1865-69), during which he promoted several important public acts, including one for the improvement of the older part of the city. R. C. latterly wrote a work on *Ancient Sea Margins*; after which appeared his *Domestic Annals of Scotland*, 3 vols. He also edited the *Life and Works of Robert Burns*, 4

vols. A collection of his historical and miscellaneous papers was issued under the title of *Select Writings of Robert Chambers*, 7 vols. His latest production was the *Book of Days*. In 1863 he received from the university of St. Andrews the honorary distinction of LL.D. R. C. died at St. Andrews, 17th Mar., 1871, leaving a high character for literary application, integrity, and geniality of disposition. In 1872, W. C. received the honorary distinction of LL.D. from the university of Edinburgh. Engaged in miscellaneous literary labor, he continued head of the firm of W. and R. C., which owns an extensive printing and publishing establishment in Edinburgh, and a publishing establishment in London. The whole of the works issued by W. and R. C. aim at popular instruction, free of all political or sectarian bias. William C. died, 1883, and Robert C., eldest son of R. C., conducted the *Journal* until his death in 1888.

CHAMBERSBURG, borough and the co. seat of Franklin co., Penn., on Conococheague Creek; 52 miles southwest of Harrisburg. It is finely situated in the broad Cumberland Valley, in the midst of a populous and well-cultivated region, and is a well-built borough. It suffered considerably during the civil war, and in 1864 a large part of the town was burned by the Confederates, under General McCausland, with a loss of more than a million dollars. Chambersburg contains a court house, churches, national banks, an academy, and Wilson College for young women. There are daily and weekly newspapers, manufactories of shoes, furniture, carriages, wool, paper, iron, milling-machinery, and boilers; and the shops of the Cumberland Valley Railroad. Chambersburg is on the Cumberland Valley, the Chambersburg and Gettysburg, and the Western Maryland railroads. Pop. '90, 7863.

CHAMBERTIN is a famous vineyard situated near the town of Dijon, the former capital of the old duchy of Burgundy. It covers about sixty acres, and is divided among several proprietors. The annual yield is usually about 300 hogsheads, and it is considered one of the finest of the Burgundy wines.

CHAMBERY, a t. of Savoy, of which it is the capital, beautifully situated in a rich vine-clad valley, between two ridges of hills, about 45 m. w.s.w. of Geneva. Though situated at an elevation of nearly 1000 ft. above the sea, the climate of C. is mild; the scenery around, with the river Leysse flowing through the valley, is exceedingly fine. The town itself, however, is dull and uninteresting. Some towers and other fragments of the old castle of the dukes of Savoy still remain. Pop. '91, 20,922.

CHAMBLY, a s.w. co. in the province of Quebec, Canada, on the St. Lawrence, opposite Montreal; 190 sq.m.; pop. '91, 11,704. Chief town, Longueuil.

CHAMBORD, a very celebrated castle of France, in the department of Loir-et-Cher, situated in the midst of a vast walled park 21 m. in circumference, about 12 m. e. of Blois. Its foundation was laid in 1526, by Francis I., who employed 1800 men constantly in its erection until his death. The work was continued with less zeal by his successors, Henri II., Henri III., Charles IX.; and Louis XIV. and Louis XV. also made some additions to it. The building, which marks the transition between the fortified castle and Italian palace, is surmounted by a vast number of turrets, minarets, and cones; its most prominent features, however, being six enormous round towers, each 60 ft. in diameter. The double spiral staircase in the central tower is of great architectural interest, being so contrived that parties pass up and down without meeting each other. The castle has no less than 440 chambers. C. was the scene of the gallantries of Francis I. Here Henri II., Louis XIII., and Louis XIV. resided; and at one of the brilliant fêtes given at the castle by the latter, Molière performed, for the first time, his play of the *Bourgeois Gentilhomme*. Among the other occupants of C. were marshal Saxe, Stanislaus, king of Poland, and Marshal Berthier, upon whom it was bestowed by Napoleon I. It was bought from Berthier's widow by a number of legitimists, and presented to the duc de Bordeaux, who was hence called comte de C. (q.v.), who presented it to the French nation.

CHAMBORD (HENRI CHARLES FERDINAND MARIE DIEUDONNÉ D'ARTOIS, DUC DE BORDEAUX), Comte de, the representative of the elder branch of the house of Bourbon, and of its claims to the French throne, was b. in Paris, Sept. 29, 1820. He was the grandson of Charles X., and the son of Berri who was murdered by Louvel. Feb. 14, 1820. The duke of Angoulême, Charles X.'s eldest son, being childless, the duke of Berri was heir-presumptive; and as, at his death, he left only a daughter, the joy was great when, seven months after, his widow gave birth to a prince, who received the title of duke of Bordeaux—that of comte de C., by which he was subsequently known, being derived from the castle of C. (q.v.), presented to him at his baptism. He was baptized, amid circumstances of great pomp, with water brought by M. de Châteaubri and from the river Jordan, and received the appellation of *l'enfant du miracle* ("the miraculous child"). When Charles X. abdicated the crown at the revolution in 1830, he did so in favor of his grandson, the duke of Bordeaux. The people, however, insisted on the "citizen king," and the elder Bourbons were banished. On the death of Charles X., the duke of Angoulême assumed the title of Louis XIX., and another party proclaimed the duke of Bordeaux king; but at last a reconciliation was brought about by prince Metternich. In 1839, the prince visited Italy, accompanied by his mother, and

was received by the petty courts with great distinction. After the death of the duke of Angoulême, in 1844, the heads of the different fractions of legitimists met to pay their united homage, and the duke of Bordeaux made a "pilgrimage to Belgrave Square" to receive it. In 1846, he married the eldest daughter of the duke of Modena, who had never acknowledged the monarchy of July. After the revolution of 1848, many legitimists were returned to the national assembly. In 1850, the duke of Bordeaux, or count of C., as he styled himself, appeared at Wiesbaden, where a congress of his adherents assembled to consult as to their future policy. As the count of C. was without heirs, a union, or "fusion," as it is called, of the partisans of the elder Bourbons with the Orleanists was effected, but no attempt made to carry out the arrangement. After the capitulation of Paris in 1871, the count of C. returned to France, and, under the title of Henry V., issued a proclamation, in which he promised, if placed by the nation at the head of its affairs, to maintain the temporal power of the pope. He died, Aug. 24, 1883. His manifestoes never induced the French people to accept him as their king.

CHAMBORD, MARIE THÉRESE BÉATRICE GAËTANE, Countess de, Archduchess of Austria; b. July 14, 1817; wife of the Bourbon who called himself Henry V. of France, and eldest daughter of Francis IV., duke of Modena. Her sister was the wife of Don Juan de Bourbon, and mother of Don Carlos, duke of Madrid. She won great reputation and respect for her care of sick and wounded French soldiers during the German war.

CHAMBRE ARDENTE ("the fiery chamber"), a name given at different times in France to an extraordinary court of justice, probably on account of the severity of the punishments which it awarded, the most common being that of death by fire. In the year 1535, Francis I. established an inquisitorial tribunal, and a *chambre ardente*. Both were intended for the extirpation of heresy. The former, of which the pope was a corresponding member, searched out, by means of spies, cases of heresy, and instructed the processes; while the latter both pronounced and executed the final judgment. Under Henri II., the activity of the C. A. received a new impulse, the entrance of that monarch into Paris on the 4th July, 1549, being signalized by the burning of several heretics. But Francis himself, gallant and gay, as courtly history represents him, also seemed to relish a spectacle of this kind, for on various occasions he and his mistress presided at a burning. By and by, the C. A. relaxed in its penalties, and a cry was got up among the more bigoted Roman Catholics that it was conniving at heresy. This seems to have roused the "lurking devil" in its members, and, in order to wipe away the reproach, they commenced a series of unheard-of cruelties, which, along with other events, contributed to originate the religious war of 1560. In 1679, Louis XIV. employed it for a new and more praiseworthy purpose—viz., to investigate the numerous reports of poisoning cases which the trial of the Marchioness Brinvilliers (q.v.) caused to be circulated. Many persons of the first rank, such as the *Maréchal de Luxembourg*, and the princess Louise of Savoy, were examined on suspicion, but no one was executed except the pretended sorcerer, Voisin (1680), after whose time the C. A. ended its activity.

CHAMBRE INTROUVABLE (Fr. unfindable chamber; i.e., the chamber the like of which is not to be found again) was the name sarcastically given to that chamber of deputies in France which met after the second return of Louis XVIII. (July, 1815), and which, by its fanatical royalty, began to throw the country and society anew into commotion. The former chamber, which had shown much moderation, had been dissolved under the influence of the court party; and the ministry, led by Talleyrand, had done everything to procure for the ruling party at least a manageable chamber adapted for business. The number of the deputies was arbitrarily raised from 259 to 392; and to secure the victory of a complete restoration, all rushed forward who saw in the constitutional charter an encroachment on their privileges and pretensions. When it is considered, in addition, that the elections, at least in the departments of the south, took place under terror and the sanguinary outrages of a populace in a state of political and religious excitement, that the press was stifled, and the people deprived of all freedom of expression by the foreign armies, ultra-royalism could not fail to be completely triumphant. When the ministers saw this startling result, they did not venture to open the session; they resigned, and gave place to the Richelieu ministry. Then broke out the most frightful excesses in the southern provinces. At the elections in Nîmes (23d Aug.), more than 100 persons were killed by the royalist bands. At last, on 7th Oct., the king opened the chamber, on which he enjoined quietness and moderation; and it appeared as if it did take this advice to heart for an instant. But when, in one of the first sittings, Boyer d'Argenson asked for the intervention of the chamber in behalf of the Protestants, who were being slaughtered in the south by the ultra-royalist bands, the speaker was called to order, and the chamber from that time ceased to observe any bounds or moderation. The fanatical legislation of this chamber inspired the ministers, the king, and especially the emperor Alexander, with so much aversion and apprehension, and also met so decidedly with the disapprobation of all peaceful and sincere friends of the throne, that the news of its dissolution, on 5th April, 1816, was received with universal rejoicing. The electoral law of 5th Feb., 1817, prevented the return of a similar chamber; and it was not till by the modified electoral law of 1820 that ultra-royalism regained a predominating influence in parliament. It is said that Louis XVIII. first

used the epithet *chambre introuvable* in an ironical sense, and that the majority of the chamber took it seriously as a compliment.

CHAMBURE, AUGUSTE LEPELLETIER DE, 1789-1832; a French soldier, whose daring at Dantzic in 1813, and in other places during Napoleon's wars, earned for him the name of "the devil." He was a prisoner for a time, but was released, and restored to military command in France. After Louis Philippe came to the throne, C. became one of the staff of Soult, minister of war.

CHAMELEON, a southern constellation within the antarctic polar circle, and containing nine stars.

CHAMELEON, *Chamaleo*, a genus of saurian reptiles, constituting a distinct family, of very peculiar form and structure, and on various accounts highly interesting. The body is much compressed; the dorsal line sharp, in some of the species rising into an elevated crest; the back of the head is also elevated into a sort of cone. The neck is very short, and does not admit of the head being turned, for which, however, compensation is found in the remarkable powers of motion possessed by the large prominent eyes, which move independently of one another, and are covered with a membrane pierced only with a small hole for the pupil to look through. There are no external ears. The skin is not covered with scales, but, like shagreen, rough with granules. The legs raise the body rather higher than in most of the saurians; the toes, both of the fore and hind feet, are divided into two sets, one directed forward, and the other backward, so that each foot has the power of grasping like a hand. The tail is long and prehensile. The lungs are very large, and are connected with air-cells that lie among the muscles and beneath the skin, so that the animal has a remarkable power of inflating itself with air. The tongue is remarkably extensile, and is the organ by which the animal seizes the insects which constitute its food, being darted at them with unerring aim, whilst a viscous saliva causes them to adhere to it, and they are carried with it into the mouth. Chameleons are slow in their movements, except those of the eyes and tongue, and remain long fixed in one spot, awaiting the approach of insects, which they seize on their coming within reach. They all live among the branches of trees. Their power of fasting is great, and along with their gulping of air in respiration, and their habit of inflating themselves with air, gave rise to the fable, current among the ancients and until recent times, of their living on air. Their celebrated power of changing color is not equally fabulous, and perhaps it would be rash in the present state of knowledge on the subject to assert how far it has been exaggerated. It is probably in part under the control of volition, and may be used, as has been asserted, to render the animal less easy of observation, by assimilating it to the color of surrounding objects; it may depend in part on the action of light; it is certainly connected with the fear and other passions of the creature. Milne Edwards has discovered that it depends upon the presence of two differently colored layers of pigment in the skin.

Chameleons are natives of the warm parts of the old world, but are most abundant in Africa. One species is found in some parts of the s. of Europe, as near Cadiz. The whole number of known species is small.

The fables which, in former times, were current regarding the C. were extremely numerous and ridiculous. It supplied not a few of those medicines to which absurd credulity ascribed the most marvelous powers. See *illus.*, REPTILES, ETC., vol. XII., fig. 6.

CHAMFERING. In architecture, an angle which is slightly pared off, is said to be chamfered. The chamfer is sometimes made slightly concave, in which case it is called a *hollow* chamfer. Chamfers, in Gothic architecture, have frequently ornamental terminations of various kinds. The term C. is applied to wood-work as well as stone.

CHAMFORT, SÉBASTIEN ROCH-NICOLAS, 1741-94; one of the most remarkable and among the first of French bohemians, or brilliant but thriftless authors. He was the illegitimate son of a strolling actress, and never knew his father. Starting in life with only the name "Nicolas," he found his way to Paris, got into the collège des Grassins, worked hard, and won nine prizes out of ten in two years. Much disgusted with the Latin hexameters that crowned his college reputation, he considered the time wasted which he had spent over them, summarizing his opinion in the contemptuous epigram, "What I have learned by study, I do not know; the little I do know I have guessed." He assumed the name of C., and began writing for the press. Being repelled alike by booksellers and editors, he took to writing sermons at a louis each for lazy or incompetent priests. Having successfully competed for one of the academy prizes, the salons of the upper world were opened to him, and he became fashionable. He went on with alternate success and failure, always poor, and living for the most part upon eleemosynary dinners and suppers, repaying countenance and sustenance with his always brilliant but cynical and sarcastic conversation. He was entertained at Sèvres for some years by Mme. Helvetius, and Chabanon gave him his pension of 1200 livres in the *Mercur de France*. C. also took two more academy prizes, won a hundred livres from Necker, and obtained an enormous reputation. He wrote little and talked much; his reputation increased, and finally, under the protection of the duchesse de Grammont, he went to court, where the prince de Condé made him his secretary. He was now

about 40 years old, and fast growing misanthropic. He resigned his secretaryship and retired into solitude at Auteuil, where he fell in love and married a lady attached to the household of the duchesse de Maine. She was a clever, amusing woman of the world; but in six months she left C. a widower. Then he traveled in Holland, where he lived awhile with M. de Narbonne. Then, returning to Paris, he received the chair in the academy left vacant by the death of Sainte Pelaye in 1781. He haunted the court and made himself loved in spite of his withering and uncontrollable irony; but in consequence of an unfortunate love affair he left the court and was received into the house of M. de Vaudreuil; about which time he made the acquaintance of Mirabeau, whom he assisted with orations, and whom he followed heart and soul into the storm and tumult of the revolution. He forgot his old friends; he frequented the clubs, and was for a time secretary of that of the Jacobins; he became a street orator; was among the first of the storming party to enter the Bastille; and worked for a royalist journal in which he depreciated kingships. With the fall of the Girondins his political life came to an end; but he could not restrain the tongue that had made him famous; he no more spared the convention than he had spared the court. This rashness was the cause of his arrest, and he was threatened with a second arrest, whereupon he attempted suicide with pistol and poignard; and, shockingly hacked and shattered, dictated to those who came to arrest him the well-known declaration: "I, Sebastien Roch-Nicolas Chamfort, declare that I would sooner suffer death as a free man than be conducted as a slave to prison." He did not die immediately, but lingered awhile in charge of a gendarme. To the abbé Sieyès he had given fortune in the title of a pamphlet, *What is the Third Estate? Everything. What has it? Nothing.* And to Sieyès also he spoke the famous sarcasm: "At last I am about to leave the world, where the heart must be broken or be changed to brass." As a writer, C. left little of value. It was as a conversationalist, and especially for his epigrammatic wit and cynicism, that he won a world-wide fame.

CHAMIER, FREDERIC, an English novelist, was b. in London, 1796. He entered the navy as a midshipman in 1809, and distinguished himself in the American war. He left the service in 1833. The success of Marryat in depicting sea-life led C. to try the same field, in which he was not without success, though in invention and humor he falls short of his model. His best romances are—*Life of a Sailor* (3 vols., Lond. 1834); *Ben Brace* (3 vols., Lond. 1835); *The Arethusa* (3 vols., Lond. 1836); *Trevello Hastings* (3 vols., 1841); *Passion and Principle* (3 vols., 1843); *Tom Bowline* (3 vols., 1839); *Jack Adams* (3 vols., 1838), etc. All his novels have been translated into German. C. wrote a *Review of the French Revolution of 1848* (Lond. 1849), in which he gives a rather prejudiced view of some of the prominent actors. He died on the 1st of Nov., 1870.

CHAMISSE, ADELBERT VON, one of the most celebrated of German lyric poets, was b. in 1781, at the castle of Boncourt, in Champagne. His parents settling in Prussia in 1790, he became a page of the queen, and entered upon a military career. But when the campaign of 1806 broke out, he returned to France, for though no admirer of Napoleon, he was unwilling to fight against his native land. At this time, he was thrown into the circle of Madame de Staël at Coppet, and there began that study of natural philosophy which he afterwards pursued at Berlin. In 1814, count Rumjanzow, chancellor of the Russian empire, prepared an exploring expedition round the world at his own expense; C. accompanied it as naturalist. He embarked at Cronstadt under capt. Otto von Kotzebue, chief of the expedition, which, however, failed in its main object—that of discovering a north-east passage. Subsequently, he obtained a situation in the botanical garden of Berlin, was made a member of the academy of science; and after a happy domestic life, died there in 1838, universally loved and honored. He wrote several works on natural history, but his fame rests chiefly on his poetical productions. As early as 1804–1806, he, together with Varnhagen von Ense, published a *Musen Almanach*. In 1813, he wrote his original and amusing fiction called *Peter Schlemihl*, the story of the man who loses his shadow, which has been translated into almost all the languages of Europe. The character of his poetry is wild and gloomy, and he is fond of rugged and horrible subjects. In his political songs, he succeeds well in humor and irony; nor is he deficient in deep and genuine feeling. Indeed, several of his ballads and romances are masterpieces in their way. We may instance one of his longest poems, *Salas y Gomez*, written in terza rima, as a proof how peculiarly German the cast of C.'s mind was, despite his French origin. His collected works, in six volumes, appeared at Leipsic in 1836–39.

CHAMOIS, *Antelope rupicapra*, Ger. *gemse*, a species of antelope (q. v.) inhabiting the Alps and other high mountains of central and southern Europe, as the Pyrenees, the Carpathians, and the mountains of Greece; also those of some of the Mediterranean islands, Caucasus, Taurus, and other mountains of the w. of Asia. It is one of the antelopes sometimes designated *capriform* or goatlike, because of their departure from the typical or true antelope form, and approach to that of the goats. The C. is about the size of a large goat, but the neck is longer in proportion, and the body shorter; the horns seldom more than 6 or 7 in. long, black, rising nearly straight up from the forehead, and so bent back at the tip as to form a hook. The color is brown, deeper in winter than in summer; the tail is black; the head is of a pale-yellow color, with a dark-brown band along each cheek.

The usual summer resort of the C. is in the higher regions of the mountains which it

inhabits, not far from the snow-line, and it is often to be seen lying on the snow. In winter it descends to the higher forests. The aromatic and bitter plants of the mountain-pastures are its favorite food. It is—like the ruminants generally—very fond of salt; “and many stones are met with in the Alps, hollowed out by the continual licking of the C., on account of the saltpeter with which they abound.” It is gregarious: flocks of 100 are sometimes seen; but in the Swiss Alps, where the numbers have been much reduced by hunting, the flocks are generally very small, and often consist only of a few individuals. Old males often live solitarily. The C. produces one or two young at a birth, in the month of March or April.

It is an animal of extraordinary agility, and flocks may often be observed sporting in a remarkable manner among the rocky heights. It can leap over ravines of 16 to 18 ft. wide; a wall of 14 ft. high presents no obstacle to it; and it passes readily up or down precipices which almost no other quadruped could attempt. It is said to descend obliquely almost perpendicular precipices of more than 20 ft., striking its feet once or twice against the rock, as if to stay and guide its descent, and alighting securely, often on a very narrow ridge of rock, with its hind feet first, and bringing the forefeet almost into contact with them.

The hunting of the C. is an occupation attended with great hardships and much danger, but of which, nevertheless, some of the Swiss peasants become passionately fond. The hunter sometimes goes out on the adventurous chase alone; but more frequently several go out together, dividing into parties; and whilst the flock of C. flee from those whose approach they first descry, an opportunity of using the rifle is obtained by their comrades. The scent of the C. is extremely keen; and when by this sense it is apprised of the approach of the hunter, it becomes alarmed and restless until it sees him, upon which it rushes hastily in an opposite direction, and so falls into the ambushade. When a flock of C. is feeding, one is always on the watch, and by a sort of whistle, announces apprehended danger.—The flesh of the C. is highly esteemed. Its skin is made into leather, and from it the original *shammy*, or *shammy* leather, so much prized for softness and warmth, was obtained, although the name has now become common also to leather prepared from the skins of other animals. See LEATHER.—When taken young, the C. is easily tamed.—The C. of the Persian mountains is smaller. See illus., ANTELOPES, ETC., vol. I.

CHAMOMILE, or CAMOMILE, *Anthemis*, a genus of plants of the natural order *compositæ*, sub-order *corymbifera*, distinguished by imbricated bracts, a scaly conical receptacle, a ray of one row of female florets, those of the disk hermaphrodite, the achenia obscurely four-cornered, and destitute of pappus. The species are annual and perennial herbaceous plants, chiefly natives of Europe and other temperate parts of the world. Several are found in Britain, amongst which is the COMMON C. (*A. nobilis*), the most important species of the genus, well known for its medicinal virtues, a perennial plant with a stem about a foot long, procumbent and much branched, each branch terminated by a flower (head of flowers) more than an inch broad, with yellow disk and white ray, the whole plant intensely bitter and highly aromatic. Its medicinal virtues are ascribed to the essential oil which it contains, *oil of chamomile*, which abounds most of all in the involucre. This oil is of a greenish-yellow color, and is used in the preparation of some medicines. The dried flowers are often administered in the form of an infusion, as a stimulant of the nerves of the abdomen, an alterative and antispasmodic; or are applied to the skin as an anodyne, and on account of their power of promoting absorption and suppuration. The infusion also acts as an emetic, and is often used to assist the action of other emetics. C. flowers find a place in the pharmacopœia, and are also amongst the most esteemed of domestic medicines, the plant being extensively cultivated for their sake, and very generally finding a place even in cottage-gardens. Yet they ought to be used with caution, as they have been known to produce congestion in the brain, and are very apt to aggravate any malady of this kind already existing. A double-flowering variety of C. is more generally cultivated than the single, to supply the C. flowers of the shops, the flowers being whiter and more bulky, but it is otherwise rather inferior. C. is easily propagated by parting the roots. It delights in a dry and rather poor soil.—The name WILD C. is given to a very similar plant, also a native of Britain (*matricaria chamomilla*), an annual belonging to a genus closely allied to *anthemis*. It may readily be distinguished by the want of scales on the receptacle. Its medicinal virtues resemble those of common C., and although now disused in Britain, it is in some parts of Europe preferred for internal use, because it is less bitter, less nauseous, and generally milder and more agreeable in its operation.—No small quantity of common C. is illegally used in the manufacture of beer in England, and is imported from Germany for this purpose. Yet this plant is so abundant in some parts of the s. of England as to form a principal part of the pasture in sheep-walks, and to fill the whole air with its scent. The other British species of C. (*anthemis*) are mere weeds; one of them, called stinking C. (*A. cotula*), is so acrid as to blister the fingers, if much handled. But the flowers of the CO-EE C., or DYER'S C. (*A. tinctoria*), a native of many parts of the continent of Europe, yield a beautiful yellow dye, on account of which the plant is often cultivated.

CHAMOND, Str., a t. of France, in the department of Loire, situated at the confluence of the Gier and the Ban, about 7 m. n.e. of St. Etienne, on the railway between that

place and Lyons. It is a flourishing well-built town, with extensive manufactures of ribbons and stay-laces. C. has also several silk-mills and numerous iron furnaces and foundries; and extensive coal-mines exist in the vicinity. Pop. '91, 14,693.

CHAMORERIL, a lake of Ladakh or Middle Thibet, in lat. 32° 55' n., and long. 78° 15' e. It lies at a height of 15,000 ft. above the sea, on the plateau between the upper waters of the Suttle and of the Indus, girt by mountains which rise, at some points, 5,000 ft. above its own level. Though it is beyond the recognized limits of perpetual congelation, yet it freezes only in winter, and is hence supposed to be of great depth. Necessarily receiving much water from the surrounding mountains, it is without any visible outlet—evaporation alone, even at this elevation, appearing to maintain one uniform surface on a length of 15 m., and a width of 2½.

CHAMOUNI, or **CHAMONIX** (Lat. *Campus munitus*), is the name of a wild and romantic valley and village among the Alps in Savoy. It lies at a distance from all the high-roads, at an elevation of about 3,400 ft. above the level of the sea, and more than 2,000 ft. above that of the lake of Geneva. The valley is about 13 m. long, and about 2 broad, and is traversed by the Arve. It is bounded at the e. end by the Col de Balme, over which there is a mule-path to Martigny, in the upper valley of the Rhone, and from the other end issues the road to Geneva, which lies at a distance of 53½ m. from Chamouni. On the n. side lies Mont Breven and the chain of the Aiguilles Rouges, and on the s., the giant group of Mont Blanc, from which enormous glaciers or rivers of ice slide down, even in summer, almost to the bottom of the valley. The chief of these glaciers are the Glacier des Bossons, des Bois, d'Argentière, and du Tour. By ascending to a point called Montanvert, we come upon the upper course of a glacier, where it expands into a great mountain-lake of ice called the Mer de Glace, in which there is a solitary rock or oasis called Le Jardin, about seven acres in extent, and covered with the most beautiful herbage. The excursion to the Jardin is one of the most striking excursions within the range of Chamouni. Until 1741, the valley was almost unknown; the region was considered a wilderness, and known by the name of Les Montagnes Maudites, or "accursed mountains." In the above year, it was visited by two Englishmen, Pocock and Wyndham, who ascended as far as Montanvert; and a granite block there still bears the name of the Englishmen's Stone. It was only, however, in 1775, that the attention of travelers was effectually called to it by Saussure and Bourrit. The valley is rich in peculiar plants, and furnishes an aromatic and perfectly white honey. The village of C. owes its origin to the Benedictine convent founded between 1088 and 1099. The pop. of the village is about 2,400, who depend partly upon the strangers who visit the valley, and partly upon the pastures and upon hunting. There are several good hotels, and the best guides are to be found here for the neighboring Alps. It is from C. that Mont Blanc is usually ascended.

CHAMPAC, *Michelia champaca*, an Indian tree, possessing great beauty both of foliage and flowers, and much venerated both by Brahmanists and Buddhists. Images of Buddha are made of its wood. Its flowers have a pale-yellow tint, and a sweet oppressive perfume, much celebrated in the poetry of the Hindus.

CHAMPAGNE, formerly a province of France, now forming the departments of Seine-et-Marne, Aube, Yonne, Haute-Saone, and Ardennes. The province was about 180 m. long by 150 broad, its surface presenting extensive plains with ranges of hills, especially in the north and east. Upon these hills is grown the famous Champagne wine.

In ancient times, C. was known as a part of Gallia, was subjugated by Cæsar, and afterwards was annexed to the kingdom established by the Franks. After the 11th c., it had its own dukes, who were vassals of the French kings. By the marriage of Philippe IV. with Joanna, heiress to the kingdom of Navarre, Champagne, and Brie, C., in 1284, came to the French crown, and was incorporated by Philippe VI., in 1328. During the campaign of 1792, the eastern part, and, in the campaign of 1814, the western part, of C. was the chief arena of warfare.

CHAMPAGNE, or **CHAMPAIGNE**, PHILIPPE DE, 1602-74; a painter of Brussels, born of a poor family. He was a pupil of Fouquier, and in 1621 was employed with Nicholas Poussin to paint in the Luxemburg Palace. His best work is in Vincennes, and in the Carmelite church in Paris, where may be seen his celebrated crucifix. He became first painter to the queen of France, and rector of the Paris Academy.

CHAMPAGNE WINE is the produce of vineyards in the above-mentioned province of Champagne. There are white and red champagnes; the white is either sparkling or still. Sparkling or effervescent (*mousseux*) C. is the result of a peculiar treatment during fermentation. In Dec., the wine is racked off, and fined with isinglass, and in Mar. it is bottled and tightly corked. The fermentation being incomplete when the wine is bottled, the carbonic acid gas generated in a confined space dissolves in the wine, and communicates the sparkling property to champagne. To clear the wine of sediment, the bottles are first placed in a sloping position with the necks downward, so that the sediment may be deposited in the necks of the bottles. When this sediment has been poured off, some portion of a *liqueur* (a solution of sugar-candy in cognac) is added to the wine, and every bottle is filled up with bright clarified wine, and securely

re-corked. The effervescence of the wine thus prepared bursts many bottles, in some cases 10 per cent; and in seasons of early and sudden heat, as many as 20 and 25 per cent have been burst. Wine-buyers estimate the value of wine according to the breakage, that which breaks most bottles being considered best. Still or non-effervescent C. is first raked off in the Mar. after the vintage. Creaming or slightly effervescent C. (*demi-mousseux*) has more alcohol, but less carbonic acid gas than sparkling champagne.

The best varieties of this wine are produced at Rheims and Epernay, and generally on a chalky soil. Among white Champagnes of the first class, the best are those of Sillery, which are of a fine amber hue, dry spirituous, and possessing a superior *bouquet*; those of Ay and Mareuil are less spirituous, but are sparkling, with a pleasant bouquet. Other white wines of first class are those of Hautvilliers, Dizy, Epernay, and Pierry.

In the first class of red C., or Montagne, we have the varieties of Verzy, Verzenay, Mailly, St. Basle, Bouzy, and Thierry; all having fine color, clearness, good body, sufficient spirit, and a pleasant *bouquet*. The trade in Champagne wines is chiefly carried on in Rheims, Aise, Epernay, and Chalons-sur-Marne. The cellars in which the vintages are stored are cut out of the calcareous rock. The fact that the sale of C. is very extensive and lucrative, has naturally given rise to adulterations. Sugar, and the juices of pears or gooseberries, or birch-juice, etc., have been used for making spurious Champagne. It may fairly be reckoned that not even a third part of the wine sold for C. in Paris is genuine. The greater part of it is readily manufactured by simply charging other light wines with carbonic acid gas. Recently, the German purveyors have succeeded in preparing light wines—such as Rhenish, Main, Neckar, Meissner, and Naumburg—so much like genuine C., as to deceive even the connoisseur. Altogether, it is estimated that the district produces 1,100,000 hectolitres (24,200 gallons) of genuine C., of which, however, the finest growths make but a small part.

CHAMPAIGN, a co. in e. Illinois, intersected by the Wabash, the Illinois Central, and the Cleveland, Cincinnati, Chicago, and St. Louis railroads; 1000 sq. m.; pop. '90, 42,159. The surface is level, and the chief productions are corn, broom-corn, oats, potatoes, wheat, hay, cheese, butter, wool, and sorghum molasses. Co. seat, Urbana.

CHAMPAIGN, a co. in w. Ohio, intersected by Mad river, and by the Cleveland, Cincinnati, Chicago and St. Louis, and the Pittsburg, Cincinnati, Chicago and St. Louis railroads; 447 sq. m.; pop. '90, 26,980. The chief productions are corn, wheat, oats, potatoes, hay, butter, and wool. Co. seat, Urbana.

CHAMPAIGN, a city in Champaign co. Ill., on the Illinois Central, the Cleveland, Cincinnati, Chicago and St. Louis and the Wabash railroads, 48 miles s.e. of Bloomington; 128 miles s.s.w. of Chicago. Champaign is a handsome and growing place. The city contains churches, high school, public library, the State laboratory of natural history, model waterworks, daily and weekly newspapers, and national banks, and has electric lights and electric street railroads. It is the seat of Illinois University, which was founded in 1868, and endowed by a grant of land. There are several parks in the city; a fine one, containing ten acres, is an attractive feature of the residential quarter. There are numerous manufactories of furniture, wagons, twine and cordage. Pop. '90, 5539.

CHAMPARAN, a district in India, in the Behar province, under the jurisdiction of the lieutenant-governor of Bengal; 26° and 28° n., and 84° and 86° e. The district is a vast level except in the n. and n.w., where it is undulating and rugged as it nears the mountains of Nepaul. The s. and w. portions are well cultivated, and have a dense population. There are only two towns of consequence, Bettiah and Motihari. Pop. '91, 1,859,000.

CHAMPARTY, or CHAMPERTY (Fr., from Lat. *campi partito*, a division of lands), an offense known to the law of England, which consists in a bargain between the plaintiff or defendant in a suit, and a third party, generally a lawyer, that the latter shall have part of the land, debt, or other thing sued for, in the event of success, and that in the meantime he shall carry on the suit at his own expense. This practice has been strictly forbidden by statute in England from very early times (3 Edward I. c. 25; 13 Edward I. c. 49; etc.); and in Scotland the rule of the civil law by which the *pacum de quotâ litis* was held to be a *pacum illicitum* (q.v.), and as such void, has all along been part of the common law. Such practices were also forbidden by statute to members of the college of justice (1594, c. 216). There is this difference between the laws of the two countries, however, that whereas in England the offense has always been punished criminally, in Scotland the only penalty which it entails beyond nullity of the bargain, is deprivation of office. In former times, the evil chiefly apprehended from C. probably was, that the honesty of judges might be tampered with by advocates who were generally their friends, and not unfrequently their very near relatives, if permitted to be personally interested in the issue of the causes in which they were professionally employed. In our own day, the chief danger consists in the encouragement which might thus be given to dishonest and oppressive litigation, and the facilities which would be afforded for nefarious transactions between the agents on the opposite sides. That practices closely analogous to C., though unnamed, are not unknown in the lower strata of the legal profession in all countries, is but too probable. The necessities of

trade have further introduced considerable equitable modifications into the law of C., which will be explained under CHOSE IN ACTION. See BARRATRY.

CHAMP DE MAI. See CHAMP DE MARS.

CHAMP DE MARS, originally CHAMP DE MAI, the title given to annual meetings of the Franks of Gaul in the 5th c. and later. They were national assemblies in which the chief men gathered to pay obeisance to their chief; or were special meetings called by the king, to deliberate upon important matters; or military reviews. One of the Carolingians changed the time of regular meeting from Mar. to May, whence the name. The Romans called them *plactia*.

CHAMP DE MARS, a great parallelogram in the environs of Paris, between the Seine and the Ecole Militaire, used especially for military purposes and drills. It is 1093 yards long and 537 wide, with four rows of trees on either side, flanked by ditches, and entered by five gates. It has been the site of many remarkable political and other demonstrations, from that against the legislative assembly in 1791, to the more peaceful universal expositions of 1867, 1878, and 1889.

CHAMPE, JOHN, 1752-98; a soldier in the revolutionary army, who was sent as a spy to New York with a view to carry off Arnold, who, after the discovery of his treason, had taken refuge in the British lines. C. discovered that Arnold was in the habit of walking in his garden at a late hour every night, and arranged to seize and hurry him to a boat and across the Hudson; but on the appointed night Arnold had changed his head-quarters and failed to appear. C. immediately escaped and rejoined the patriot army, but he was at once honorably discharged from service, lest if taken prisoner he should be summarily hanged as a spy.

CHAMPFLEURY (real name JULES FLEURY), b. 1821. Beginning as a clerk with a Parisian book-publisher, he speedily acquired reputation by such books as *Confessions of Sylvius*; *Adventures of Mariette*; *Stories of Winter, Spring, and Autumn*; and a number of pantomimes. He was one of the founders of *L'Evenement* newspaper; and an author of *Les Oies du Noel* for Proudhon's *Voice of the People*. A satire on country life, *Les Bourgeois de Molinchart*, added to his fame. His works have been published with illustrations, including the *History of Ancient and Modern Caricature*. He d. in 1889.

CHAMPION (from a Gothic root signifying to contend, fight; Ang-Sax. *camp*, fight). In the judicial combats of the middle ages, it was allowed to women, children, and aged persons, except in cases of high treason or of parricide, to appear in the lists by a representative. Such a hired combatant was called a champion. Those who followed this profession were generally of the lowest class, and were held disreputable; for besides the perils of the combat, they were liable to be executed as well as their clients. They were obliged to wear a peculiar dress of leather, and peculiar armor, which was also held disreputable. They were not allowed to fight on horseback, and appeared in the lists with their hair and nails cut short. Champions are mentioned as early as in the time of Charlemagne; and Otto I. employed them in deciding the succession to the empire. At a later period, in the age of chivalry, the word C. came to have a more dignified acceptation, and signified a knight who entered the lists on behalf of an injured lady, of a child, or of any one incapable of self-defense. In England, the crown even had its C., who, mounted on horseback and armed to the teeth, challenged, at every coronation at Westminster, all who should deny the king to be the lawful sovereign of the three realms. This practice is understood to have been first introduced under Richard II., and it continues to make a part of the ceremonial of an English coronation to this day. The name of C. was also given to the knight who, during a tournament, had charge to see that no injury or insult should be offered to the assembled ladies.

CHAMPION HILLS, in Hinds co., Miss., where, May 16, 1863, a confederate force under Gen. Pemberton had a short fight with Gen. Grant's forces, then marching upon Vicksburg. The confederates were beaten and forced to retreat to Big Black River.

CHAMPLAIN, LAKE, separating the states of New York and Vermont, and penetrating, at its n. end, about 6 m. into Lower Canada. It empties itself into the St. Lawrence, about 45 m. below Montreal, by the Sorel or Richelieu. It is navigable throughout for vessels of about 100 tons, having its communications improved by one canal on its own river, and by another to the Hudson. It stretches in lat. from 43° 30' to 45° 6' n., and in long. from 73° to 73° 30' w., its length being 126 miles; its extreme breadth, however, never exceeds fifteen miles. It abounds in deep bays, and bold promontories, and contains about fifty islands, the largest of which are North and South Hero and Isle La Motte. The views obtained of the Adirondacks and the Green mountains are magnificent. Its principal towns are Whitehall at the s., Plattsburg on the w., and Burlington on the east. This lake, discovered in 1609 by Samuel Champlain, and its tributary, lake George, have been prominent in the history of the country—during the rivalry of France and England before the conquest of 1759-60; during the revolutionary struggle of 1775-82; and lastly, during the war of 1812-14, between Great Britain and the United States.

CHAMPLAIN, a co. in the province of Quebec, Canada, bordering on the n.w. bank of the St. Lawrence, about midway between Montreal and Quebec; 229 sq. m.; pop. '91 29,267. It is intersected by the St. Maurice and other rivers. The soil is fertile, and there is abundance of good timber. Besides ordinary agricultural crops, tobacco and maple sugar are raised. Chief town, Batiscan.

CHAMPLAIN, a town in Clinton co., N. Y., on the Canada border, forming the extreme n.e. point of the state, and on the Central Vermont and other railroads. The town contains the villages of Champlain and Rouse Point. It has manufactures of iron, agricultural implements, etc. Pop. '90, town 5207, village 1275.

CHAMPLAIN, SAMUEL DE, 1567-1635; the son of a sea captain, and when young in the army of Henry IV. of France. He accompanied the Spanish fleet to the West Indies, and on his return wrote an account of the voyage. In 1603, he was sent to Canada by De Chaste, on whom the king had bestowed some of the new territory. From 1604 to 1607 he was engaged in exploring the coasts and seeking a desirable place for a settlement. The next year he made a third voyage, and began a settlement at Quebec. After many misfortunes and struggles, the settlement became prosperous. In 1629 it was captured by some English adventurers, and C. was taken to London, but was set at liberty in 1632. The next year he returned to Canada, and died there.

CHAMPLIN, JAMES TIFT, D.D., b. Conn., 1811; a graduate of Brown university, and tutor therein; from 1838-41 pastor of a Baptist church in Portland, Me.; 1841-57, professor of ancient languages in Waterville college, and from 1857-72, president of the same institution, now known as Colby university. He published a number of college text-books and historical works. He d. in 1882.

CHAMPLIN, JOHN DENISON, b. Stonington, Conn., 1834; graduated at Yale coll., 1856. He studied law in Litchfield, Conn., was admitted to the bar there in 1859; in 1862 began literary work; in 1864 was assoc. ed. of Bridgeport (Conn.) *Daily Evening Standard*; 1865-69 was ed. of Litchfield (Conn.) *Sentinel*. He edited *Fox's Mission to Russia* (New York, 1873), and, 1873-77, was one of the corps of editors of Appleton's *American Cyclopædia*; author of *Young Folks' Cyclopædia of Common Things* (New York, 1879), *Young Folks' Cyclopædia of Persons and Places* (1880), *Young Folks' Astronomy* (1881), *Young Folks' History of the War for the Union* (1881), *Chronicles of the Coach* (1886); joint editor with C. C. Perkins of *Cyclopædia of Painters and Painting* (4 vols., N. Y., 1886); with W. F. Apthorp of *Cyclopædia of Music and Musicians* (3 vols., N. Y., 1888).

CHAMPNEY, BENJAMIN, b. N. H., 1817; an artist noted for landscape painting of Alpine and White mountain scenery. In early life he was a lithographer in Boston.

CHAMPNEY, JAMES WELLS, artist, b. Mass., 1843; learned the business of wood engraving, taught drawing, and studied painting in Europe. He served as a volunteer in the civil war. His wife (Elizabeth Williams) is a popular writer.

CHAMPOLLION, JEAN FRANÇOIS, an illustrious name in modern Egyptian archæology, was b. Dec. 23, 1790, at Figeac, in the department of Lot, France. In 1801, he was introduced to Baron Fourier, secretary to the *Institut d'Égypte*, who initiated him into the science of Egyptian antiquities. In 1807, C. went to Paris, in order to pursue, with more advantage, his oriental studies; and, in 1809, was appointed professor of history in the lyceum of Grenoble. In 1811, he published his work, *L'Égypte sous les Pharaons*, intended as the forerunner of a more elaborate work on Egypt, of which only the geographical section appeared, in 1814. In his endeavor to decipher the Rosetta stone, C. labored under the error of supposing that in this inscription the hieroglyphics were wholly ideographic, and the demotic and hieratic characters wholly phonetic. Afterwards, he was led to believe that the hieratic characters were of the same nature as the hieroglyphic, and this conviction he expressed in a communication made to the *Académie des Inscriptions*, in Aug., 1821. In the same year he published his essay, *Sur l'Écriture Hiératique des Anciens Égyptiens* (Grenoble), a work which is now scarce. In this essay he continued to assert the common ideographic nature of both hieroglyphic and hieratic characters. Meanwhile C. had been made acquainted with the conclusions of the acute mathematician, Dr. Thomas Young (q.v.), respecting the phonetic use of hieroglyphic signs. Without doubt, it was this important discovery, of which Dr. Young, however, made no great use, that set C. on the right track of investigation, and led to those brilliant results which were regarded by Niebuhr as constituting the greatest discovery of the century. By a comparison of the name of Ptolemy on the Rosetta stone with that of Cleopatra on the Philæian obelisk, he was enabled to lay the foundation of an alphabet, which he continued to elaborate until it now forms the basis of modern Egyptian archæology. His first decisive discoveries were made known in his celebrated *Lettre à Mons. Dacier* (Par. 1822), which was followed by the *Précis du Système Hiéroglyphique* (Paris, 1824; second ed. 1828); but his principal work, the *Grammaire Égyptienne*, was posthumously published in 1836.

In 1824, appeared his *Pantheon Egyptien*; and, in 1825, his celebrated letters to the duc de Blacas, in which he explains the names and titles of many of the Pharaohs, written on the monuments in Drovetti's Egyptian collection at Turin, and attempts to class them into dynasties. His theory of interpretation was much controverted at first, but its importance was recognized by such distinguished scholars as Rosellini, Bunsen, sir William Gell, and others.

In 1828, he was appointed by Charles X. to accompany a scientific expedition to

Egypt, of which the results were given by Rosellini in the *Monumens de l'Égypte et de la Nubie* (Par. 1835-45). On his return to Paris, 1830, C. was made a member of the *Académie des Inscriptions*, etc.; and, in the following year, was appointed to the new chair of Egyptian antiquities in the college of France; but soon after the commencement of his intended course of lectures, in May, 1831, he fell ill, and died, Mar. 4, 1832. According to Silvestre de Sacy, "few men, since the birth of letters, have rendered to erudition services equal to those which have consecrated to immortality the name of Champollion."

CHAMPOLLION-FIGEAC, JEAN JACQUES, a distinguished French archæologist, was b. 1778, at Figeac, in the department of Lot. After holding in Grenoble the offices of librarian and professor of Greek literature, he was appointed, in 1828, conservator of MSS. in the imperial library in Paris; but, after the Feb. revolution, was deposed from office by Carnot. In 1849, he was appointed, by Louis Napoleon, librarian of the palace of Fontainebleau. Besides the *Antiquités de Grenoble* (1807), his chief works include the *Annales des Lagides* and *Égypte Ancienne* (forming a part of *L'Univers Pittoresque*); *Les Tournois du Roi René*, a splendid work, with lithographs by Motte, and several publications of old French documents. After the death of his younger and more celebrated brother, C. was employed in editing the MSS. left by that distinguished scholar, and has given an account of them in the *Notice sur les Manuscrits Autographes de Champollion le Jeune* (Par. 1842). He died May, 1867.

His son, AIMÉ CHAMPOLLION-FIGEAC, 1813-94, followed the same path of historical antiquarianism, and published several interesting and useful works.

CHANAK'-KALESSI' (Turkish, "Pot Castle"), a t. of Anatolia, deriving its name from its manufactures of crockery, is situated on the Dardanelles, about 28 m. s.w. of Gallipoli. Its castle is the most important on the Dardanelles, which name is sometimes given to the town itself. Pop. about 11,100.

CHANCE, in its original and strict meaning, may be defined as that which determines the course of events, in the absence of law, ordinary causation, or providence. Strictly speaking, it is an idea which few would now be disposed to admit as corresponding to anything which really exists; the religious mind excluding it as inconsistent with the belief in the divine government, and the philosophical mind rejecting it as inconsistent with a recognition of universal laws of causation. As a word, however, it has always been, and always will be popularly accepted; and its use is correct so far as we overlook, or choose for the moment to throw out of view, the more universal connection of events, and regard them as their emergence, on a superficial view, appears to be determined. The idea of C., as referring to some apparently capricious or at least inexplicable cause of an event, distinguishes it from the word probability, or the degree with which the expectation of an event approves itself to a particular mind, the first expressing what metaphysicians would call an objective, and the second a subjective idea. It is clear that C., being only legitimate as an expression in popular parlance—or if admitted as a term in philosophy, one that would at once lead into the most inextricable problems—is a term which is much too indefinite to admit of any kind of measurement; while what we call probability, or the degree with which an expectation approves itself, owing to certain data presented to the mind, does, as we shall hereafter see, admit of a kind of measurement which leads to very important consequences. For these reasons, the consideration of what is sometimes called the *doctrine of chances*, but what is more properly the *theory of probabilities*, will be found under the head of PROBABILITY.

CHANCEL (Lat. *cancellus*, a screen). The C., choir, or eastern part of a church, was often separated from the nave by a screen of lattice-work, so as to prevent general access thereto, though not to interrupt either sight or sound. As it was in this part of the C. that the service was always performed previous to the reformation, the clergy were held to have a special right to it, in return for which its repairs in general still fall on the impropriator, rector, or vicar, and not on the parish. The chief pew in the C. belongs to the rector or impropriator, but the disposal of the seats in the church, with this exception, belongs to the ordinary, or, practically, to the churchwardens, to whom the authority of the ordinary is delegated. No monument, moreover, can be set up without the ordinary's consent. The term C. is usually confined to parish churches which have no aisles around the choir, or chapels behind it or around it; and in this case the C. and the choir have the same signification. But in larger churches there are sometimes chancels at the ends of the side aisles, and this whether the choir has the character of a choir in the larger sense, or of a chancel. See CHURCH.

CHANCELLOR (Lat. *cancellarius*). It is said that the chief notary or scribe of the Roman emperor was called C., either because he was intrusted with the power of obliterating, *cancellum*, or *crossing out* (*cancellare*, to make lattice-work) such expressions in the edicts of the prince as seemed to him to be at variance with the laws, or otherwise erroneous; or because he sat *intra cancellos*, within the lattice-work or railings (*cancelli*) which were erected to protect the emperor from the crowding of the people when he sat in judgment. Neither the title nor the office of C. is at all peculiar to England. The C. of France (chancelier de France), from a very early time, was an officer of state of great power and dignity, under whom several other officers, bearing also the title of C., were employed in the administration of justice and in the defense of the public

order. The C. of France was the constitutional interpreter of the will of the sovereign; his functions being, on the whole, analogous to those exercised by the C. of England. As an instance in the change of the value of money, not more remarkable than many which could be cited in our own country, it may be mentioned that, in 1290, the salary of this high official was six sous a day, with the privilege, to him and his, of eating at the court. When he was at Paris, and ate at his own lodgings, he had 20 sous a day. The office was abolished at the revolution; and though it was restored by the Bourbons, and even under the first Napoleon the higher-sounding title of arch-chancellor was revived, many of the functions of the old C. were transferred to the minister of justice, and have ever since been held by him.

In most of the other countries of Europe there are officers of state who bear this, or analogous titles, though their powers and duties are very various. The chief functionary in the Austrian empire has often been termed C.; and on the reconstitution of the German empire, Prince Bismarck was made "C. of the empire" (*Reichskanzler*). Besides these state-chancellors, there were officers in many other capacities to whom the title was given. Every bishop has his C. in the church of Rome, and there are still law chancellors of cathedrals, dioceses, universities, chancellor of a cathedral, chancellor of a diocese, chancellor of a university.

In our own country the constitutions of some of the United States create this officer and define his power by legislative statute. In New York, the officer was recognized with others of colonial (English) appointment in the first and second constitutions, but in the constitution of 1846 the court of chancery was abolished, and the C. passed out of office. The tendency of late years is to merge the courts of chancery into the superior law courts. Separate chancery or equity courts exist in only a few states; in others the courts of law sit also as courts of equity; in some equity relief is administered under the forms of the common law; and in others still the distinction between law and equity has been formally abolished. The federal courts exercise equity jurisdiction whether the state courts in the district are courts of equity or not.

CHANCELLOR, LORD. It is usually said that the existence of the office in England, as in the other states of Europe, is to be ascribed to the influence which the constitution of the Roman empire had on the constitutions of the modern nations. This influence was exercised in no small measure through the medium of the church, the profession of the law being generally exercised by ecclesiastics; and it is for this reason, probably, that the bishop and the king are furnished with officers bearing the same title, and exercising analogous functions. The C. is always the confidential adviser of the sovereign in state affairs. It is for this reason that he has been called the keeper of his conscience, and that in England it is to him that the duty was intrusted of presiding over a court which acted on what were called—by way of contradistinction—equitable considerations. It is in this latter prerogative that the chief distinction exists between the C. and all other judges; for, whilst they are held by the letter of the law, he was at one time supposed to act rather *juxta bonum et æquum*. In certain more special points of view, there is a similarity between the functions of the chancellors in different states. "In all of them he seems to have had the supervision of all charters, letters, and such other public instruments of the crown as were authenticated in the most solemn manner; and therefore, when seals came into use, he had always the custody of the sovereign's great seal."—Stephen's *Commentaries*, vol. iii. p. 398. It is from this last-mentioned circumstance that the office of C., or keeper (q.v.), which, by 5 Elizabeth, c. 18, is declared to be exactly the same, is created without writ or patent, by the mere delivery of the great seal, and that the C., if a baron, takes precedence of every temporal lord not a member of the royal family, and of all bishops except the archbishop of Canterbury. The C. is a privy-councillor by his office, a member of the cabinet, and prolocutor, or speaker of the house of lords, by prescription. Though the form in which his tenure of office is terminated, is by the resumption of the great seal by the sovereign, the C. practically resigns office with the party to which he is attached. He has the appointment of all justices of the peace throughout the kingdom, but this privilege he exercises generally on the recommendation of the lord-lieutenants. But the most important, and, as it now seems, somewhat anomalous branch of his patronage, arises out of his having been originally an ecclesiastic. Though the last bishop who held the office was John Williams, archbishop of York, who was lord keeper from July 10, 1621, to Nov. 1, 1625, the C. still continues to be patron of all the crown livings of the value of £20 per annum, or under (though in 1863 about 300 were sold to augment the incomes of those sold and those retained), and visitor of all hospitals and colleges of the king's foundation. As representing the paternal character of the sovereign, again, the C. is the general guardian of all infants, idiots, and lunatics, and has the supervision of all charitable uses in the kingdom. As regards his judicial patronage, the arrangement is, that the C. appoints in general all the judges of the superior courts, except the two chief-justices, who are nominated by the prime-minister of the day. Of inferior appointments, the latter also has reserved to him the commissioners of bankruptcy and the judges of the county courts. All these functions the C. performs in addition to his extensive duties as the supreme judge of the court of chancery, both as an ordinary court of common law and of record, and as an extraordinary court of equity. Much inconvenience had arisen from the accumulation of duties in the single

person of this high dignitary, and various expedients had been devised for lessening the evil. Vice-chancellors had been appointed, and the duties of the master of the rolls had been extended. In 1875, a considerable change was made by consolidating all the vice-chancellors' courts into one division, called the chancery division of the high court. And the C.'s duties in the house of lords as the highest appeal court were lightened in 1876. The proposal of a minister of justice has, however, not yet found favor. The salary of the C. is £10,000 a year, and he has an annuity of £5,000 on his retirement from office. The style of the C., since the union with Scotland, has been lord high chancellor of Great Britain; but he has scarcely any jurisdiction in Scotland, and in Ireland there is a separate C., having powers in most respects the same as those of the C. of Great Britain. To slay the C. is treason under 25 Edward III. c. 2.

CHANCELLOR OF A CATHEDRAL is an officer who superintends the arrangements for the celebration of the religious services. His office is quite distinct from that of the

CHANCELLOR OF A DIOCESE, who, as vicar-general to the bishop, is an ecclesiastical judge, appointed to assist the bishop in questions of ecclesiastical law, and hold his courts for him. By 37 Henry VIII. c. 17, it is provided that the C. of a diocese may be a layman, whether married or single, provided he be doctor of the civil law, lawfully create and made in some university. By the canons of 1603, he must be a bachelor of law, at the least, or a master of arts. There are certain cases, however, in which the bishop must sit in person. In case of complaint against a clerk in holy orders, for any ecclesiastical offense against the church discipline act (3 and 4 Vict. c. 86), the bishop is to hear the cause, assisted by three assessors; of whom the dean of his cathedral, or one of his archdeacons, or his chancellor, must be one; and a serjeant-at-law, or advocate who has practiced 5 years in the court of the archbishop of the province, or barrister of 7 years' standing, another.

CHANCELLOR OF THE EXCHEQUER. See EXCHEQUER.

CHANCELLOR OF SCOTLAND. Previous to the union of the two kingdoms in 1707, when the office was abolished, the C. of S. performed functions in many respects analogous to those which belong to the lord high chancellor of Great Britain. He presided in parliament, and was the head of all the courts of judicature; he was the chief counselor of the king, and keeper of the great seal. From the fact of the distinction between law and equity in the English sense never having been recognized in Scotland, the C. had no judicial functions separate from those of the ordinary courts of law, but he had the principal direction of the chancery, the constitution of which is described below. In early times, the C. of S., as of England, was very frequently an ecclesiastic; but the first, Constantine, earl of Fife, in the reign of Alexander I., and the last, the earl of Seafeld, who held the office at the union, were both laymen; and many other nobles, earls of Argyle, Angus, Huntly, etc., appear in the lists given in Crawford's *Officers of State*, and Chalmers's *Caledonia*. On the abolition of the office, a keeper of the great seal was appointed, who acts merely ministerially in affixing it to the writs which pass under it. See GREAT SEAL.

CHANCELLORSVILLE, BATTLE OF, in Spottsylvania co., Va., between the union army under Gen. Hooker and the confederate forces under Gen. Lee, May 2, 1863. Hooker had succeeded Burnside in command of the army of the Potomac, and after nearly three months' work brought it into a state of efficiency. He had 132,000 men, 13,000 of whom were cavalry. This army, in seven corps, lay on the Rappahannock opposite to Fredericksburg. On the heights on the other (right) bank the confederate army was strongly intrenched; it numbered 62,000 men, of whom about 3,000 were cavalry. Hooker resolved to turn the confederate left flank, first sending nearly all his cavalry to destroy communication with Richmond. April 27th, Hooker sent 36,000 men up the left bank of the river beyond the confederate line, and they crossed safely. The objective point was C. a solitary brick dwelling-house in a wide and barren region. Before sunset, on the 30th, 48,000 union soldiers had reached the place. Another considerable union force had crossed the Rappahannock below Fredericksburg, and were making demonstrations in the confederate front. Lee appears to have been unaware of these movements until the evening of the 30th. At midnight his men were in motion, and before noon of May 1st he was in line of battle in Hooker's front. At daybreak "Stonewall" Jackson, with 30,000 confederates, moved behind the shelter of a dense forest (the "Wilderness"), and at 3 P.M., after a march of 15 m., fell upon the union army while the men were preparing their dinner, with arms stacked and their intrenchments unguarded. The union forces fled without making a stand, and pushed towards C. There they were with difficulty brought to a stand. Jackson, who had pursued them closely, rode out to reconnoiter, when he was fired on by his own men who mistook his escort for a union company. He died on May 10th. Thus far the greatest damage suffered by the federals was the temporary disorganization of Howard's corps, which was the weakest corps in the field; and this was more than supplied by the arrival during the night of a large corps from Fredericksburg. On the morning of May 3d (Sunday), Hooker was still on the defensive. The confederates began the attack, and it was hotly continued until 10 o'clock, both sides suffering severely. While Sickles was bearing the brunt of Stuart's attack, the ammunition

failed, and Sickles sent for aid. At the moment the message came to Hooker, he was struck by a spent ball and fell insensible to the ground; so there was no one to send aid to Sickles, and he was obliged to fall back. The weight of some half-dozen assaults fell upon his division, until he was overpowered and his lines destroyed. The day passed in desultory fighting and strategic movements, in which, on the union side, there was much indecision and loss of opportunity. During Monday night Hooker resolved to abandon his position, and threw up intrenchments to cover his bridges. A storm came on Tuesday afternoon, but during the night the union forces crossed the river, and the battle was over. The losses, as set forth in official reports, were: on the union side, 17,000, of whom 12,000 were killed and wounded and 500 missing; on the side of the confederates about 13,000, of whom 10,300 were killed and wounded and 2,700 missing.

CHANCELLOR OF A UNIVERSITY. The highest honorary office connected with a university is generally that of chancellor. See **UNIVERSITY**.

CHANCE-MEDLEY, AND CHAUD-MEDLEY, OR MELLÉ (Fr. *chaud*, hot; and *mélée*, a fray), as it is called in Scotland, are French expressions borrowed by our law. Though often spoken of as synonymous, they are, in reality, distinct in meaning—the one signifying a casual affray; the other, an affray in the heat of blood or passion. Both are in this country, and in most others, recognized as pleas in mitigation of the offense of *homicide* (q.v.). See also **SANCTUARY**.

CHANCERY (Lat. *cancellaria*). As the Roman emperors, and after them the various sovereigns who divided the vast inheritance of the empire, had each a chancellor (q.v.), so in every European kingdom there was an establishment called a *C.*, where these officers performed their functions. If we imagine a large chamber divided by lattice-work (*cancelli*), the outer half devoted to the people, the inner occupied by the chancellor and his subordinates, engaged in framing edicts, letters of nobility, and the like, and engrossing them on parchment, and sealing them with the king's own seal in proof of their authenticity, and then handing them through the railings to the people without, we shall have a pretty good conception of the *C.* in its earliest form.

CHANCERY, COURT OF, until recently the highest court in England, inferior only to Parliament. Originally a chancery was the office of a secretary or chancellor where official documents were put in form, sealed and dispatched, or filed as records; the derivation of the word is supposed to be from a Latin word meaning lattice-work, referring to the screening off in olden time of such an office. The chancellors originally had a purely ecclesiastical jurisdiction; they assumed first as a matter of conscience and equity a legal authority in law relating to real estate in this way; the passage of the statutes of *mortmain* forbade the gift of land to religious corporations; to avoid this the chancellors devised the plan of having the land granted to a third person to hold to the use of the religious body (see *CESTUI QUE USE*); they then affirmed the use as binding in conscience. In matters not connected with *mortmain* this idea was soon found useful as giving relief from common law difficulties in transferring real estate. Gradually the jurisdiction of the chancellor's court became enlarged until it assumed to provide a remedy wherever the common-law machinery was defective. Equity supplemented the common law by considering the intention rather than the wording of legal principles; it must not be considered, however, as synonymous with natural justice as, like the common law, it depends on established rules and principles; it is, as we have said, supplemental to the latter but not necessarily of superior authority. Thus, it affords a relief in cases of fraud, accident or even mistake in contracts, where the common law could consider only the written instrument; and in some cases an equity or chancery court may set aside or cause to be totally changed an instrument in writing. A large class of cases coming under equity practice is that where an injunction, temporary or permanent, is sought against the doing of some injurious act; here it is evident that the common law was defective in that it would only award damages *after* the act was done. An equity court also can compel the discovery of facts within the knowledge of a defendant, and unlike common law courts, it may and often does afford relief by compelling the specific performance of contract or other legal obligation. The practice of an equity court differs in many respects from one of common law; in the former a subpoena takes the place of the *capias* of the latter; suit begins in equity by a bill of equity or petition; in common law by a declaration. The constitution of the court of chancery in England consisted of the lord high chancellor, the master of the rolls, and three vice-chancellors. From an early date the Court of Chancery obtained an administrative jurisdiction over the affairs of infants, married women, and insane persons when thrown into litigation. Such persons were known as *wards of chancery*, and any interference or exercise of influence over them was punished with great severity. From the anomalous character of the origin and growth of jurisdiction of this court, its procedure and precedents were complicated in the extreme. Well-founded complaint was made of the delays and expense accompanying chancery litigation. One great English authority, Lord Westbury, went so far as to say that England supported one set of tribunals to do injustice and another to remedy it. Charles Dickens satirized in *Bleak House* some of the defects of the system. Shortly after the publication of this novel and, it may be, partly in consequence of it, the procedure was simplified to some extent, but it was increasingly evident that a unifying of the double system of equity and common law was eminently desirable, and

in 1873 an act was passed by which the court of chancery became one division of the high court of justice, retaining its equity jurisdiction but transferring its ordinary jurisdiction to other divisions of the court. This forms an important part of that "fusion of law and equity" under the Judicature Acts, 1873-76, which has so simplified and made orderly the practice of English courts.

In the United States the terms court of chancery and chancery are used in some states as equivalent to courts of equity and equity. The principles and practice of equity were generally transferred to this country as they existed in England; but in most of the states there are not separate courts of chancery, the same judges sitting, according to the nature of the case, either as a common law or equity court. A few states, however, constituted courts of chancery under that name; these were Alabama, Delaware, Florida, Mississippi, New Jersey, Tennessee, and Vermont. As early as 1848 the state of New York not only abolished the distinction between courts of equity and common law, but did away with the old forms of practice in both, substituting, for instance, for the old declaration (at common law) or bill (in equity) and the pleadings which followed, a simple complaint or statement on the part of the plaintiff and answer from the defendant. Many of the states have followed this admirable reform. By the United States Constitution federal courts are especially given jurisdiction in equity as well as in common law cases.

CHANCERY. See SYPHILIS.

CHANDAH, a t. of India, on the s.w. frontier of the territory of Nagpore, on the left bank of the river Eraee, near its junction with the Wurda, 90 m. s. of the town of Nagpore. Its walls, built of cut stone, and surrounded by a high parapet, are 6 m. round, from 15 to 20 ft. high, and flanked with round towers large enough for the heaviest guns. Within the place, and almost equidistant from the n. and s. faces, is a citadel; the rest of the interior consists of straggling streets, detached houses, and plantations. It is well supplied with water. In 1818, C. was taken by the British. Pop. 17,000. C. is capital of a British administrative district having an area of 10,785 sq.m., and a pop. of 649,146.

CHANDÂL'A, the lowest of the impure classes in Hindu caste. Besides the four pure classes there are various mixed and more or less impure classes, some of which, the C. for instance, are so vile that their shadow is pollution, and no true Hindu will take shelter under the same roof or tree with them.

CHANDELEUR ISLANDS, in the Gulf of Mexico, between the mainland of Mississippi and the mouth of the river. There is a light on the n. end of the most northerly island, in 30° 8' n., and 88° 52' west.

CHANDERNAGORE, a French city, with a scanty territory of about 2000 acres, on the right or w. bank of the Hoogly, 21 m. above Calcutta by railway, on the opposite shore, in lat. 22° 50' n., and long. 88° 23' east. The population, estimated at about 30,000, consists of a few Europeans and Eurasians, the great bulk being natives.

CHANDLER, CHARLES FREDERICK, PH.D., LL.D., b. Mass., 1836; educated at Harvard, Berlin, and Göttingen. In 1857 he was appointed professor of chemistry in Union college; in 1858, in the New York college of pharmacy; in 1864, in the school of mines of Columbia college; and in 1876, professor of chemistry and medical jurisprudence in the college of physicians and surgeons. He became chemist of the New York board of health in 1865, and president in 1873. In 1897 he resigned the chair of chemistry in the college of physicians and surgeons, and the office of dean of the school of mines of Columbia university in order to devote more time to the chair of chemistry in the university. In 1870, with his brother, he established *The American Chemist*. He is the author of many important scientific papers.

CHANDLER, DR. RICHARD, a scholar and antiquary of considerable eminence of the last century, was b. at Elson, in Hampshire, in 1738, and educated at Oxford. He first became known as the editor of the magnificent work, *Marmora Oxoniensis*, published by the Oxford university in 1763. He afterwards traveled through Greece and Asia Minor, with Revett, an architect, and Pars, a painter, at the instance of the then flourishing Dilettanti society, with a view to collect information regarding the former state of these countries, and to procure exact descriptions of the ruins. The result of their united labors appeared in 1769, in 2 vols., entitled *Ionian Antiquities*. C. also published a valuable account of the ancient inscriptions of Asia Minor and Greece; and his account of his travels in these countries, issued in 1765-76, is still a standard work. He also published a *History of Troy*. He died in Feb., 1810.

CHANDLER, JOSEPH RIPLEY, 1792-1880; b. Kingston, Mass.; removed to Philadelphia and founded there the *United States Gazette*, which he edited for many years. He was a highly respected citizen, a representative in congress from Penn., 1849-55, and was appointed minister to Naples, 1858.

CHANDLER, SETH C., astronomer; b. Boston, Mass., 1845; long attached to the Harvard observatory; was awarded the gold medal of the Royal astronomical society of

London in 1896 for his determination of the laws of the movements of the earth's pole and his researches in the department of variable stars. He died in 1896.

CHANDLER, WILLIAM EATON, b. N. H., 1835; graduated from Harvard law school, 1855; was speaker of N. H. legislature, 1863-64; appointed judge-advocate-gen. of the navy dept., 1865; first asst. sec. of the Treasury under Sec. McCulloch for two years; secretary of the navy, 1882-85; elected to U. S. senate, 1887, 1889, and 1895.

CHANDLER, ZACHARIAH, b. N. H., 1813; d. Chicago, 1879. He was educated in a common school and seminary. At the age of 22, he went to Michigan and settled in Detroit, where he became a wealthy and prosperous merchant. He was an early and active member of the whig party, and in 1851 was elected mayor of the city. The next year he was nominated for governor, but was defeated. When the republican party was organized, he took an active part, and was by it chosen U. S. senator in 1856. In the senate he was a firm opponent of all schemes for the extension of slavery, and stood side by side with Benjamin Wade of Ohio, and others who resisted the arrogant tone of the extreme pro-slavery senators. When the civil war broke out, Chandler was one of the foremost in favor of a vigorous prosecution, and had little respect for those whom he denounced as traitors. In 1875, he was defeated for senator, but was at once appointed secretary of the interior, where his business talent soon became manifest in the improved administration of the department. In 1868, and again in 1876, he was chairman of the republican national committee, having the general management of the party canvass. The day before he died he made a powerful speech to a great mass-meeting.

CHANDLER SCIENTIFIC DEPARTMENT See DARTMOUTH COLLEGE.

CHANDORE, a t. and fort in the district of Nassick (q. v.), presidency of Bombay, its lat. and long. being 20° 20' n. and 74° 14' east. C. is a flourishing place, with a pop. of about 5,000. The fort, which commands an important pass on the route between Candeish and Bombay, is situated on the summit of a hill naturally inaccessible everywhere but at the gateway. It surrendered to the British in 1804; and being subsequently restored to Holkar, was finally ceded by him in 1818.

CHANDOS ANTHEMS, a series of compositions, written by Handel for the chapel at Cannons, while he was musical director to the duke of Chandos, 1718-20. They contain airs, choruses, and overtures. The MSS. are in Buckingham Palace.

CHANDOS CLAUSE. During the discussion of the clauses of the reform (q. v.) bill in 1831, the marquis of Chandos (tory), afterwards duke of Buckingham, proposed the insertion of a clause giving the county franchise to *tenants at will* occupying lands for which they paid an annual rent of £50. This was opposed by the ministers on the ground that the class proposed to be enfranchised would be subject to the coercion of the landowners, who would thus virtually determine the elections. The amendment, however, was supported by many of the radicals, who at that time regarded any extension of the suffrage as a boon, and was carried by a majority of 84. The clause was incorporated in the bill of the following year, and was finally carried.

CHANFRON. A frontlet of metal, forming part of the suit of armor worn by a charger in mediæval times. Its place was between the eyes, protecting the frontal bone, and it was usually made with a projecting spike.

CHANGARNIER, NICOLAS ANNE THÉODULE, a French general, was born at Autun in 1793, and received his education at the military school of Saint-Cyr. In 1830, he went as lieutenant to Algeria, where he distinguished himself, and rose to the rank of gen. of division. After the proclamation of the republic in 1848, he was appointed governor-general of Algeria, in the room of Cavaignac; but being chosen a member of the national assembly, he returned to Paris, when he was appointed commander-in-chief of the garrisons of Paris and of the national guard. He held this double office till the middle of May, 1849, and again for some time after the insurrectionary movement of June of that year. C. was a member of the legislative assembly, where he held a sort of neutral position between the orleanists and legitimists and opposed to the Bonapartists. At the *coup d'état* in December, 1851, after being imprisoned in Ham, he went into exile till the Franco-Prussian war, when he offered his services to Napoleon III. He was in Metz with Bazaine; and, on its capitulation, retired to Brussels. He returned to France in 1871, entered the assembly, and assisted M. Thiers in reorganizing the army. He died Feb. 14, 1877.

CHANG-CHOW-FOO, a city of China, and capital of a department of the same name, in the province of Fuh-keen, in 24° 31' n. lat., and 1° 24' long. e. of Peking.

CHANGE. See BELL; BELL RINGING; MODULATION.

CHANGELING. It was at one time a common superstition, that infants were taken from their cradles by fairies, who left instead their own weakly and starveling elves. The children so left were called *changelings*, and were known by their peevishness, and their backwardness in walking and speaking. As it was supposed that the fairies had no power to change children that had been christened, infants were carefully watched until such time as that ceremony had been performed. This superstition is alluded to

by Shakespeare, Spenser, and other poets; and it has not yet quite died out of some of the rural districts in Britain.

CHANG-SHA-FOO, a city of China, capital of the province of Hoo-nan, in 28° 20' n. lat.

CHANLER, AMÉLIE RIVES. See RIVES, AMÉLIE.

CHANK-SHELL, the popular name of the shell of several species of *turbinella*, a genus of gasteropodous mollusks of the group *siphonostomata* (q.v.), natives of the East Indian seas. These shells are obtained chiefly on the coasts of the s. of India and Ceylon, and form a considerable article of trade to Calcutta. They are much used as ornaments by Hindu women, the arms and legs being encircled with them; and many of them are buried with the bodies of opulent persons. Those which are thrown up on the beach, after the death of the mollusk, and have become whitened, are little valued, but fresh shells from Madras amounting to 2,460,727 in one year, the value of which was about \$50,000. The quantity ordinarily exported is smaller. A chank-shell opening to the right is rare, and is highly prized in Calcutta, so that a price of \$250, or even \$500, is sometimes paid for one.

CHANNEL, ENGLISH—the *mare Britannicum* of the ancients—is that arm of the Atlantic ocean which divides England from France, gradually narrowing to the strait of Dover. It is often called simply the **Channel**; and the fleet stationed in it for the protection of the English coast, the **channel fleet**. The greatest river which falls into it is the Seine. It forms bays both on the English and on the French coast; but the larger ones are those on the French coast, whilst the best harbors are on the English.

CHANNEL ISLANDS, a group of islands belonging to Great Britain, lying off the n.w. coast of France, between Normandy and Brittany. They are about 120 m. s.w. of Southampton, and the nearest distance from the French coast is about 10 miles. The C. I. are the only parts of the dukedom of Normandy now belonging to the English crown, to which they have been attached since the conquest. King John, about the year 1200, lost all Normandy, except these isles. The chief islands of the group are Jersey, Guernsey, Alderney, and Sark. The area of the whole is 75 sq.m., and the pop. in 1891 was 92,234. They are more particularly described under **JERSEY**.

CHANNEL TUNNEL. The proposed tunnel under the narrow channel dividing England and France would be twenty-three miles long, including land-approaches. It would be made entirely through and within the area of the old gray chalk, or *craye de Rouen*, as designated by the French geologists. This bed of chalk extends from shore to shore. It consists of a mixture of 65 per cent. of chalk and 35 per cent. of clay, and is therefore impervious to water, though the experimental works have shown cracks here and there, out of which for a time exuded fresh or brackish water, apparently imprisoned for ages in these small fissures. While the experimental works have been suspended, most of these fissures have run themselves dry. The French Tunnel Company, who possess a concession for making a tunnel to the middle of the channel, and the English Tunnel Company have made many thousands of soundings and experiments, and consider it proved that the gray chalk is not only in the same position and of the same thickness and consistency on both sides of the channel, but that no erosion or fault interfering with continuity exists between the two coasts.

The experimental works on the English side have been extended, by means of a boring machine, from the foot of Shakespeare's Cliff, near Dover, to a distance of 2200 yards under the sea. The similar work on the French side, from Saugatte, near Calais, is of about the same length. Thus, about a tenth of the whole distance has thus far been successfully tested, and the opinion of the engineers engaged is that the work presents exceptionally favorable features for cheap and rapid accomplishment. The original estimate before experiment showed the way through this favorable stratum of gray chalk was about \$50,000,000; now the estimates call for only \$20,000,000. The proposal is to have two single-line tunnels, one ventilating the other, and to work the lines by engines which have been successfully designed and worked experimentally, charged with highly compressed air. In the construction of the tunnel, hardly any pumping and no timbering would be required. The machine which does the boring takes up any modicum of water with the debris which it excavates; and every turn of it gives out a portion of the air, which, at a pressure of about 25 lbs. to the square inch, is its motive force.

The instruction to the engineers by Sir Edward Watkin, the chairman of the English Tunnel Company, "to find the gray chalk at its outcrop, and never leave it," would seem to have reduced a work which at one time appeared almost impracticable to the utmost simplicity and ease of accomplishment. The scheme for a railway tunnel was discussed in 1867 and the following years. In 1876, an agreement for carrying out the scheme was entered into between the French and English governments, and boring was begun on the French side, but the excavations on the English side were stopped by order of the British government, mainly for military reasons.

The engineers whose names have been associated with various schemes for a tunnel under the Channel are Thomé de Gamond and Raoul-duval in France; and William Low, Frederick Bramwell, Francis Brady, John Hawkshaw, and Brunlees in England.

CHANNING, EDWARD TYRREL, LL.D., 1790-1856; brother of William Ellery Channing, D.D.; a lawyer of Boston, who devoted his attention chiefly to literature. In 1817-19, he edited the *North American Review*, and was a regular contributor to it through a large part of his life. He was professor of rhetoric and oratory in Harvard college, 1819-1851. A volume of his lectures was published in 1856.

CHANNING, WALTER, 1786-1876; a physician, native of Rhode Island, brother of William Ellery Channing, D.D. He studied medicine in Boston and Philadelphia, and in Edinburgh and London. In 1815, he was professor of obstetrics and medical jurisprudence in Harvard, resigning in 1854. He was also for 20 years physician of the Massachusetts general hospital. Among his writings are *Ethierization in Childbirth; A Physician's Vacation, or a Summer in Europe; Professional Reminiscences of Foreign Travel; Old and New; Reformation of Medical Science*; and a volume of poems.

CHANNING, WILLIAM ELLERY, D.D., a celebrated Unitarian preacher and author, was b. 7th April, 1780, at Newport, R. I., in the United States, entered Harvard university at the age of 14, and took his degree in 1798. In 1803, he was ordained minister of a church in Boston. During the earlier years of his ministry, his theological peculiarities had little prominence in his discourses, and in consequence he stood upon friendly terms with his brethren in more orthodox churches. In 1819, however, he preached a sermon at the ordination of the Rev. Jared Sparks, in which he advocated the Unitarian doctrine with so much zeal and ability, that he was termed the "apostle of Unitarianism." This involved him in controversy, a thing which he naturally loathed. Nevertheless, to the end of his life, he preserved a devoutly Christian heart, shrinking with the delicate instinct of a pious nature from everything cold, one-sided, and dogmatic, whether Unitarian or Trinitarian. As late as 1841, he wrote: "I am little of a Unitarian, have little sympathy with the system of Priestley and Belsham, and stand aloof from all but those who strive and pray for clearer light." It 1821, he received the title of D.D. from Harvard university, on account of the high talent he had exhibited in his tractate on the Evidences of Christianity, his Address on War, and his Sermons. In 1822, he visited Europe, and made the acquaintance of several great English authors, such as Wordsworth and Coleridge, both of whom were strongly impressed in his favor. Coleridge said of him: "He has the love of wisdom and the wisdom of love." In 1823, he published an *Essay on National Literature*; in 1826, *Remarks on the Character and Writings of John Milton*; in 1829, the *Character and Writings of Fénelon*; in 1835, a work in opposition to *Negro Slavery*; and in 1838, an essay on *Self-Culture*. Besides these, he wrote a variety of other essays and treatises, all characterized by vigor, eloquence, pure taste, and a lofty tone of moral earnestness. He died Oct. 2, 1842, at Bennington, Vt. An interesting memoir of him has been published by his nephew William Henry Channing (3 vols., London, 1848), and reprinted in 1880.

CHANNING, WILLIAM HENRY, b. Mass., 1810; nephew of William Ellery Channing, D.D. He graduated at Harvard in 1829, at Cambridge divinity school in 1833, and was ordained in charge of a Unitarian church at Cincinnati in 1835. After filling several pastorates in this country he succeeded James Martineau as minister of the Hope street Unitarian chapel, Liverpool, England. On the commencement of the rebellion he returned and took charge of the Unitarian church in Washington. He was one of the early supporters of the socialistic movement in this country, was editor of *The Present and The Harbinger*, and in 1848 presided over a socialistic association in Boston. He was a prolific writer, contributing to the *North American Review*, *The Dial*, *The Christian Examiner*, and other serials. Among his larger works are a translation of Jouffroy's *Ethics; Memoir of William Ellery Channing; Memoirs of the Rev. James H. Perkins; Memoirs of Margaret Fuller Ossoli*; and a work on *The Christian Church and Social Reform*. He d. 1884.

CHANSON (French), a short song or poem of separate stanzas, or divisions, called couplets, having one, or two, lines of refrain, and written in an easy, natural, flowing rhythm and style. It has been said that *En France on met tout en chansons*, and in the chanson one may read a review of the entire history of that country—political, religious, literary, and social. The chanson had its beginning in the admirable, but short-lived literature of the troubadours and northern trouvères of the 11th to the 15th centuries, whose *romans* and *fabliaux* were sung by the *jongleurs*, or wandering minstrels, to the accompaniment of the harp. These were held in such esteem that we find Philip le Bel enlisting *chansonniers* in his service. A few choice spirits stand out from the mediæval *chansonniers*, viz.: Théroutle, the supposed author of *La Chanson de Roland* (q.v.); Thibaut de Campagne; Froissart; Charles d'Orléans; and Eugène Deschamps, the Béranger, and Olivier Basselin, the Désangiers of the 15th century. With the Reformation the religious element burst through France and colored the chanson with patriotic and religious zeal, and rhymed denunciations of important persons of the times was another feature. Clement Marot belongs to this period. The Renaissance produced style in the lyric poetry of France, as well as beauty, and Malherbe assigned to this the strict laws which were preserved until the beginning of the present century. The disorder of the Fronde also had its effect on the chanson, leaving it conspicuous for its lack of taste and delicacy. In the reign of Louis XVI. the chanson became military and revolutionary, and such songs as *La Marseillaise* (q.v.); *Ça Ira* (q.v.); *Le Chant du Départ* (q.v.), and *La Carmagnole* (q.v.) were produced. With the intellectual revival after 1830, Cassimir

Delavigne, Alfred de Musset, Lamartine, Béranger, and Victor Hugo, lifted the *chanson* into a work of beauty, dignity, and in many instances of strength. The *chanson* may be classed under four divisions: the *chanson historique*, *chanson de métier*, *chanson d'amour*, and *chanson bachique*. The *chanson historique* comprises the *cantique Noël*—Christmas carol, complaints, or laments, and songs on historical themes, or narratives. The *chanson de métier* is a cry from different conditions of men. The *chanson d'amour* is on the theme of love, and exhausts all resources of rhythm, viz., the *lai*, accompanied by the *rote*, or *vielle*; the *virelai*, turning on two rhymes; the *descort*, in which the melody is changed with each couplet; also the *aubade*; the *chant royal*, the *ballade*, the *brunette*, the *rondeau*, and the *triolet*, all precursors of the modern romance. The last class, the *chansons bachiques*, are songs in which the bacchanalian element is prominent, songs in praise of the vine, or of convivial character. There are also a number of other songs—*chansons de geste*, *chansons à danser*, *chansons farcie*, etc. See Raynouard, *Choix des Poésies originales des Troubadours*; *Fabliaux et Contes des Poètes Français*, edited by Meon (Paris, 1808); Leroux de Lincy, *Chants historiques Français depuis le XIIe jusqu'au XVIIIe Siècle* (Paris, 1841); Nisard, *Chansons populaires chez les anciens et chez les Français* (Paris, 1867); Du Mersan, *Chants et Chansons populaires de la France* (Paris, 1848); Coussemaeker, *Chants populaires des Flamands de France* (Ghent, 1856); Verrimst, *Rondes et Chansons populaires illustrés* (Paris, 1876).

CHANSON DU ROLAND (or **RONCEVAUX**). See **ROLAND**.

CHANT (see **AMBROSIAN CHANT**, and **GREGORIAN CHANT**), a modification between singing and recitative especially used for litanies and psalms in the Roman Catholic and Protestant Episcopal service. The chant is the ancient style of church-song, certainly as old as Christianity, which seems to have inherited it from the Jewish church. St. Paul exhorts believers to sing (to chant) psalms and hymns and spiritual songs; and Pliny the younger mentions the early morning assembling of Christians to chant hymns to Christ. As rhymed and metrical hymns, now so common, were the product of a later art, so the tunes accompanying them are modern as compared with chants. Chanting, commended by its grand simplicity, is growing in favor.

CHANT DU DÉPART, LE, French revolutionary song, words by Marie Joseph Blaise de Chénier, music by Méhul. It was composed for the fête on the fourth anniversary of the taking of the Bastille, July 14, 1794. This is the only French national air written during the Reign of Terror, and when sung it created as great an effect as *La Marseillaise* (q.v.).

CHANTILLY, an estate in Fairfax co., Va., 20 m. w. of Washington, where, Sept. 1, 1862, a battle occurred between the right of the union army under Pope and the confederates under Jackson. The battle continued, in spite of a severe thunder-storm, until dark, but without important results. The union general, Isaac I. Stevens, was killed in the battle, and Philip Kearny, in a reconnoissance after its close.

CHANTILLY, a t. of France, in the department of Oise, about 23 m. n.e. of Paris. Being one of the most beautiful places in the vicinity of the metropolis, it attracts thence immense numbers of visitors. Apart from its natural beauty, it is interesting as the place where the great Condé spent the latter years of his life in the society of such men as Boileau, Racine, and Bossuet. The magnificent château in which he resided was pulled down at the revolution of 1793; but a lesser château, one of the finest specimens of the renaissance in France, still remains. The park and grounds are very charming. C. is also noted for its extensive manufacture of the *blonde lace*. Pop. '91, 4231.

CHANTREY, Sir FRANCIS, an eminent English sculptor, was b. at Jordanthorpe, in Derbyshire, on 7th April, 1781, not 1782, as has been generally said. His father, who was a carpenter, and rented a small farm, died when C. was only 12 years of age, leaving his mother in narrow circumstances. It is said that she gave him "as liberal an education as her limited means would admit;" but much cannot be meant by the phrase, if it be true, as asserted by Holland in his *Memorials*, that his attendance at the little lane-school was very irregular, and that "for a while he certainly drove an ass daily, with milk-barrels, between Norton and Sheffield." C.'s mother married a second time, and the boy was, in 1797, apprenticed for 7 years to a carver and gilder in Sheffield called Ramsay. It was in this humble department that C. acquired the rudiments of his future art. It was during this period that his first attempts at modeling in clay were made, and that by the help of casts taken from the faces of his fellow-apprentices and his own, he began the work of portraiture, in which his great eminence ultimately consisted. C.'s apprenticeship was canceled two years before its expiry; but his subsequent career is not very accurately known. It is certain that he visited both London and Dublin in 1802, probably in the capacity of a journeyman carver and gilder; and in that year he seems to have received instruction as a pupil of the royal academy. It was probably then that he commenced seriously to prepare himself for the work of his future life. In the earlier part of his career as an artist, C. is said to have been under great obligations to Nollekens, who had the shrewdness to see, and the generosity to see without envy, his great promise in the branch in which he himself was eminent. In 1816, C. was elected an associate, and in 1818 a member of the royal academy; and in 1819 he visited Italy for the first time. Although he executed an almost countless number of works, he never attained high rank. He died Nov. 25, 1841.

CHANTRY (Fr. *chantererie*, from *chanter*, to sing). The term C. is applied alike to endowments or benefices, to provide for the chanting of masses, and to the chapels in which the chanting takes place. These endowments were commonly made in the form of testamentary bequests, the object being to insure the erection of a chapel near or over the spot where the testator was buried, and to remunerate the priests for saying masses in it for the benefit of his soul, or of the souls of others named in his will. Many such chantry chapels are still to be seen in English parish churches; but they were more common in abbeys and monastic establishments, in which it was considered a privilege to be buried, and where some such offering to the brotherhood was, in a measure, the price of sepulture. These chapels, which have generally the tomb of the founder in the middle of them, are separated from the aisles or nave of the church by open screen-work, a circumstance which has sometimes led to their being called chancels (q.v.). Sometimes, again, they are separate erections, projecting from the church externally; but in cathedrals and the larger churches they are generally constructed within the church, often between the piers. Many chantries are lavishly enriched with sculpture and tracery of all descriptions, and some of them are adorned with gilding and painting.

CHANZY, ANTOINE EUGÈNE ALFRED, b. 1823; a French general, first served as an apprentice in the navy. In 1843 he graduated from the Paris Military School as sub-lieut. of zouaves. He served in Algeria, Italy, and Syria, and again in Algeria. In 1868 he became gen. of brigade, and early in the Franco-Prussian war he rose to commander-in-chief of the second army of the Loire. During the supremacy of the commune, he narrowly escaped death. In 1872 he was elected to the national assembly; in 1875 was chosen senator for life; in 1878 received the grand cross of the Legion of Honor; and in 1879-81 was ambassador to Russia. He d. 1883.

CHA'OS signified, in the ancient cosmogonies, that vacant infinite space out of which sprang all things that exist. Some poets make it the single original source of all; others mention along with it Gæa, Tartaros, and Eros. By some also only the rough outlines of heaven and earth were supposed to have proceeded from C., while the organization and perfecting of all things was the work of Eros. Still later cosmogonists, such as Ovid, represent it as that confused, shapeless mass out of which the universe was formed into a *kosmos*, or harmonious order. Hesiod makes C. the mother of Erebus and Nox.

CHAOS or **BIRD ISLANDS**, is the name given to several rocky islets situated at the entrance of Algoa Bay, South Africa, about 35 m. e. of Port Elizabeth. It was on one of these islands that Bartholomew Diaz, the navigator, died in 1500.

CHAPALA, the largest lake in Mexico, containing about 1300 sq. miles. It is about lat. 20° 20' n., and ranges in w. long. from 102° to 103° 25'. It is merely an expansion of the Rio Grande de Lerma, which enters the Pacific at San Blax. C. lies on the table-land of Anahuac, and has many islands.

CHAP BOOKS, the name given to a variety of old and scarce tracts of a homely kind, which at one time formed the only popular literature. In the trade of the bookseller, they are distinguishable from the ordinary products of the press by their inferior paper and typography, and are reputed to have been sold by chapmen (see **CHAPMAN**) or peddlers; hence their designation. The older C. B. issued in the early part of the 17th c. are printed in black letter, and are in the form of small volumes. Those of a later date are in the type now in use, but are equally plain in appearance. Of either variety, they were mostly printed in London; many being without dates. They were of a miscellaneous kind, including theological tracts, lives of heroes, martyrs, and wonderful personages, interpretations of dreams, fortune-telling, prognostications of the weather, stories of giants, ghosts, hobgoblins, and witches, histories in verse, and songs and ballads. See *Notices of Fugitive Tracts and Chap Books*, also *Descriptive Notices of Popular English Histories*; both by J. O. Halliwell, printed for the Percy society. An inferior class of tracts succeeded these books for the common people, and are best known as *Penny Chap Books*. For the most part they consisted of a single sheet, duodecimo, or 24 pages. Besides the title, the first page usually contained a coarse wood-cut embellishment. The paper was of the coarsest kind adapted for printing, and the price, as the name imports, was a penny each. The subjects besides being of a similar nature to the above, included stories of roguery and broad humor. These penny C. B. were issued by an obscure class of publishers in London and several English provincial towns, of which we might particularize Newcastle-on-Tyne. They were also issued from the presses of Edinburgh, Glasgow, Falkirk, and Paisley. It is a curious fact, that nearly all the penny C. B. of this very homely kind which were latterly popular, were written by Dougald Graham, who, previous to his death in 1779, filled the office of bellman or town-crier of Glasgow. The most reputable production of this humble genius was a *History of the Rebellion* in a Hudibrastic meter, which was a great favorite with sir Walter Scott, and is now scarce; see *Chambers's Journal*, first series, vol. x. p. 84; also the *Paisley Magazine* (1829), an extinct publication of great rarity, in which is given a biographic sketch of Dougald Graham, with a list of his productions. In some parts of Scotland and the n. of England, Graham's penny C. B. are still seen on stalls at markets; but the general advances in taste, along with the diffusion of an improved literature, have displaced them in almost all other quarters. Collections of the older C. B. are now found only in the libraries of bibliomaniacs, by whom they have been picked up at extravagant prices from dealers in second-hand books. In various continental

countries, there are numerous varieties of C. B. at exceedingly small prices. See John Ashton's *Chap Books of the Eighteenth Century* (1882).

CHAPEL (Fr. *chapelle*), a word derived from *capa*, which originally signified a case, or chest in which were contained the relics of a saint, and afterwards the place where the chest was kept. The term now signifies a building erected for the purposes of public worship, but not possessing the full privileges and characteristics of a church. In this sense, all places of worship erected by dissenters are now called chapels in England, and the term is also applied to supplementary places of worship, even though in connection with the established church—such as parochial chapels, chapels of ease, free chapels, and the like. In former times, it was applied either to a domestic oratory, or to a place of worship erected by a private individual, or a body corporate. In the latter sense we speak of chapels in universities and colleges. But its earliest signification was that of a separate erection, either within or attached to a large church or cathedral, separately dedicated, and devoted to special services. See **CHANTRY**. Chapels had no burying-ground attached to them, and the sacrament of baptism was not usually administered in them.

CHAPELAIN, JEAN (1595-1674), was born in Paris. His father, a notary, had destined him for his own profession, but under the influence of his mother, Chapelain began at an early age to qualify himself for literature, acquiring Greek, Latin, Italian, and Spanish. He was for a time engaged in teaching Spanish to a young nobleman, and was then appointed tutor to the two sons of M. de la Trousse, grand provost of France, in whose family he remained for seventeen years. His earliest works were a preface for the *Adone* of Marini, a translation of Mateo Aleman's novel, *Guzman de Alfarache*, and four odes, of no great merit, one of which was addressed to cardinal Richelieu. Chapelain drew up also for the newly-constituted Academy a plan of the grammar and dictionary which were to form the principal work of the young institution. In 1657 he published the first twelve cantos of his epic, *La Pucelle*, on which he had been engaged for twenty years. The epic dealt with the story of Joan of Arc, and was intended to comprise twenty-four books or cantos. His reputation at this time had become so great that six editions of the poem were disposed of in eighteen months. The work, however, brought down upon Chapelain the severest criticism from Boileau and others, and he was ridiculed to such an extent that the last twelve books were never published. A complete manuscript of *La Pucelle* exists in the Bibliotheque Nationale.

Though his epic was so unsuccessful, Chapelain seems to have had considerable merit as a prose writer and critic. His criticisms are remarkable for their justice and generosity, and his erudition and kindness of heart are everywhere apparent. Racine was indebted to him for kindly and seasonable counsel, as well as for a pension of six hundred livres. Chapelain became in his old age a miser of the most sordid type, leaving behind him at his death a fortune of 50,000 crowns.

CHAPEL HILL, a village in Orange co., N. C., 28 m. n.w. of Raleigh; pop. 1017. It is the seat of the University of North Carolina, opened in 1795.

CHAPELLE ARDENTE (Fr. "glowing chapel"), a room or mortuary chapel wherein the dead body of a person of high rank, whether ecclesiastical or civil, is laid. The hangings are in black, and burning candles illumine the scene until the final removal for burial. The custom is of great antiquity in the Catholic church.

CHAPELLE DE FER. See **HELMET**.

CHAPEL ROYAL, in the English ecclesiastical establishment, is composed of two deans (a dean and sub-dean), forty-eight royal chaplains, ten priests, and a lay-choir, styled "gentlemen of the chapel," a clerk and several deputy-clerks of the closet, and an organist. The chaplains are required to preach, each a certain number of times a year, while the dean, sub-dean, and priests read the liturgy. The services are performed at London, in the small oratory in St. James's Palace. In Scotland the appointments to the Chapel Royal are purely honorary, involving no service and carrying with them no compensation, though formerly it was attached to the palace at Holyrood and corrodged with the similar establishment in England.

CHAPERON, a hood or cap worn by knights of the garter. Such a hood was at one time in general use, but was lately appropriated to doctors and licentiates in colleges. A person who acts as a guide and protector to a lady at public places, is called a C., probably from this particular piece of dress having been used on such occasions. The name was also applied to devices which were placed on the heads of horses at pompous funerals.

CHAPIN, AARON LUCIUS, D.D., b. Conn., 1817; a graduate of Yale, and Union (N. Y.) theological seminary. In 1838, he was a professor in the New York institution for the deaf and dumb. In 1844, he became pastor of the First Presbyterian church in Milwaukee, Wis.; and in 1850 was chosen first president of Beloit college, an office which he held till 1886, when he resigned. He was for some years one of the editors of the *Congregational Review*. He d. in 1892.

CHAPIN, ALFRED CLARK, was born in South Hadley, Mass., in 1848, and studied at Williams college, graduating at the age of twenty-one. He devoted two years to the study of law in the Harvard law school, graduating in 1871; was admitted to the New

Hampshire bar the same year, and to the New York bar the following year. In 1873 he went to Brooklyn; assisted in organizing the Young Men's Democratic Club in 1880, becoming its first president; went to the Assembly in 1881; was re-elected to the Assembly in the following year; was chosen speaker in 1883; elected state comptroller 1883 and 1885; mayor of Brooklyn in 1887 and 1889; member of congress in 1891; and became a State railroad commissioner in 1892.

CHAPIN, EDWIN HUBBELL, D.D., 1814-80, b. Washington co., N. Y.; educated at a seminary in Bennington, Vt., and commenced preaching in Richmond, Va., to a congregation of Unitarians and Universalists. In 1846 he went to Massachusetts, and in 1848 to New York, where he became pastor of the Fourth Universalist church, one of the wealthiest churches in that city, and remained until his death. In 1872 he succeeded Dr. Emerson as editor of the *Christian Leader*, the principal Universalist paper. Dr. Chapin was a most effective and gifted speaker, and exerted a powerful influence for good. Besides his regular sermons he delivered a great number of lectures, and published several volumes, among which are *Duties of Young Men*; *Duties of Young Women*, *Characters in the Gospels*; *Communion Hours*; *Discourses on the Lord's Prayer*; *Crown of Thorns*; *The Beatitudes*; *Moral Aspects of City Life*; and *True Manliness*.

CHAPLAIN was originally the title of the ecclesiastic who accompanied an army, and carried the relics of the patron saint. See **CHAPEL**. It has now come to signify a clergyman not having charge of a parish, but employed to officiate at court, in the household of a nobleman, or in an army, garrison, ship, etc. Such officials began early to be appointed in the palace of the Byzantine emperors. The practice afterwards extended to the western empire, and to the courts of petty princes and even of knights, and continued to subsist after the reformation. Forty-eight clergymen of the church of England hold office as chaplains of the queen in England, four of whom are in attendance each month. Six clergymen of the church of Scotland have a similar title in Scotland; but their only duty is to conduct prayer at the elections of Scottish representative peers. A statute of Henry VIII. limits the right of nominating private chaplains in England: thus, an archbishop may have eight, a duke six, a baron three; and chaplains so appointed have certain privileges, and may hold two benefices with cure of souls. In the United States the term chaplain is officially used only of the chaplain of the senate and of the house of representatives, and in the army and the navy. In some of the states there are chaplains for one or both of the legislative bodies. In the army there are both post and regimental chaplains; and there is usually a chaplain in every regiment of militia, though they are not always ordained clergymen. In the navy there are a certain number of chaplains, according to the number of vessels in commission. It is usual, also, to appoint chaplains to state prisons, to reformatory institutions, and to asylums. Where there are radical differences of religious belief to any considerable extent, as in the institutions of New York city, chaplains of Protestant, Roman Catholic, and Jewish faith are employed or permitted to officiate.

CHAPLET, a garland or head-band of leaves and flowers. In heraldry, a C. is always composed of four roses, the other parts being leaves.

CHAPLIN, JEREMIAH, D.D., 1776-1841; a native of Massachusetts, graduated at Brown university, and for some years a tutor there. He was for 16 years pastor of a Baptist church in Danvers, Mass., and from 1820-32 President of Waterville college.

CHAPMAN, a trader, but popularly applied in a more limited sense to a dealer in small articles, who travels as a peddler or attends markets. C. is from *chap*, equivalent to *cheap*, a word which in its origin signified a market or place for trading; hence *Cheapside*, *Eastcheap*. See **CHAP BOOKS**.

CHAPMAN, GEORGE, dramatist and translator, was b. in 1557, educated at Cambridge and Oxford, and was the cotemporary and friend of Spenser, Jonson, and Shakespeare. His first play, entitled *The Blind Beggar of Alexandria*, was printed in 1598. Up to 1620, he supplied the theater with tragedies and comedies, and some of these, after the fashion of the time, were written in conjunction with other dramatists. As a writer for the stage, C. does not rank high. Despite many nervous passages, his plays want the irradiation of a constant genius, and his characters are unnatural. His translation of Homer is the most vigorous that has yet been executed in England, and in reading it, many have felt with Keats—

Like some watcher of the skies
When a new planet swims into his ken.

C. seems to have led a long, temperate, and happy life, unblasted by poetic fire. He died in 1634. Swinburne, the poet, published an edition of C.'s works, with a critical introduction, in 1875.

CHAPMAN, JOHN GADSBY, b. Va., 1808, died in 1889. He studied art in Rome, and returned to New York, where he had a studio, but not long afterwards went back to Rome, residing there many years. Among his paintings are, "The Baptism of Pocahontas" (for the capitol in Washington); "An Etruscan Girl;" "The Israelites Spoiling the Egyptians;" "The First Italian Milestone;" "A Donkey's Head;" and "The Last Arrow." He published a drawing-book that attained great popularity.

CHAPMAN, MARIA WESTON, daughter of Warner Weston, was born in Weymouth, Mass., in 1806, and died there in 1885. She was educated partly in Weymouth, partly

in England. In 1829-30, she was principal of the Young Ladies' High School in Boston. Her husband, to whom she had been married in 1830, died in 1842. Mrs. Chapman was an active abolitionist. The years 1848-56 she spent abroad, chiefly in Paris, writing in support of the anti-slavery movement. After her return to America in 1856, she published the autobiography of Harriet Martineau, who was her intimate friend.

CHAPONÉ, HESTER, authoress, daughter of Thomas Mulso, was born at Twywell, England, in 1727. She wrote a short romance in her tenth year, and after her mother's death her attention was divided between household duties and the study of French, Italian, Latin, music, and drawing. She was an intimate friend of Elizabeth Carter and Mrs. Montague. She wrote for the *Rambler*, *Adventurer*, and *Gentleman's Magazine*, and soon became known to a literary circle. She wrote an *Ode to Peace* and other poems, and *Miscellanies in Prose and Verse*, but she is now chiefly remembered by her *Letters on the Improvement of the Mind* (1772), which went through many editions. In 1760, she was married to Mr. Chapone, who died ten months afterward. She herself died in 1801. See Mrs. Elwood's *Memoirs of the Literary Ladies of England from the Commencement of the Last Century* (1843).

CHAPPE, CLAUDE, 1763-1805; b. in Rouen, France;—the inventor of the first working telegraph of any importance. His invention consisted of an upright post, on the top of which was fixed a transverse bar, and at the ends of the bar two smaller arms movable on pivots. The position of the bars represented letters or words; and by means of such machines placed at remote but easily visible points, messages were conveyed fifty leagues in a quarter of an hour. Until almost the period of electric telegraphy, the machine was used especially for noting the arrival of ships. C. was so much annoyed by charges that he had copied his invention from others, that he committed suicide.

CHAPPED HANDS AND CHILBLAINS, a lesser and a greater form of disease of the skin, produced by undue exposure to extremes of cold and heat, and affecting chiefly the most exposed joints, the skin over which swells and cracks, with itching, pain, and heat; in the most severe cases there is ulceration, which is difficult to heal in proportion to the length of time the disease has been neglected. Chilblains may generally be avoided if the hands are washed always with tepid water, and not habitually exposed to great cold, or when cold, to the heat of a fire. When formed, they may be treated with oxide of zinc ointment; or with a dilute solution of borax in glycerine and water; or with glycerine alone, slightly diluted with water; the hands being in any case habitually covered with woollen gloves in cold weather.

CHAPSAL, CHARLES PIERRE, 1787-1858; a French grammarian, joint author (with François Joseph Noel) of the *Nouvelle Grammaire Française, avec Exercices*, one of the most widely adopted of all grammars of that language. The proceeds of the book gave him a fortune, much of which was given to charities, among which was one bequest of 80,000 francs to the teachers in the environs of Paris.

CHAPTAL, JEAN ANTOINE, 1756-1832, count of Chanteloup, a French chemist and statesman. He was professor of chemistry at Montpellier, where he taught the doctrines of Lavoisier instead of those of Stahl. By the death of an uncle, C. acquired capital, which he employed in manufacturing mineral acids, alum, white lead, soda, and other chemical wares. After the revolution of Nov. 9, 1799, he was made a councillor of state by Napoleon, and succeeded Lucien Bonaparte as minister of the interior, in which capacity he established a school of arts, and a society of industries. He also reorganized the hospitals, introduced the metrical system of weights and measures, and otherwise greatly encouraged arts and sciences. On Napoleon's return from Elba, C. was made director-general of commerce and manufactures, and minister of state. The downfall of the empire sent C. to private life, but he kept his interest in science, and in 1816 was named member of the academy. See Flourens's *Éloge historique de Chaptal* (1835).

CHAPTER-HOUSE (Fr. *chapitre*), the building in which the monks and canons of monastic establishments, and the dean and prebendaries of cathedral and collegiate churches, meet for the management of the affairs of their order or society. See **CATHEDRAL**. Chapter-houses frequently exhibit the most elaborate architectural adornment, as, for example, those at York, Southwell, and Wells. The original stained-glass windows remain at York, and are of exquisite beauty. On the walls of that at Westminster, the original painting has been discovered. Chapter-houses are of various forms: those at York and Westminster are octagonal; those at Oxford, Exeter, Canterbury, Gloucester, etc., are parallelograms; Lichfield is an oblong octagon; Lincoln, a decagon; and Worcester, a circle. They are always contiguous to the church, and are generally placed to the west of the transepts. They generally either open into the church, or are entered by a passage. Chapter-houses were often used as places of sepulture, and have sometimes crypts under them, as at Wells and Westminster.

CHAPU, a maritime t. in the province of Che-Keang, China, 50 m. n, w, of Chinhaï in one of the richest districts in the country. It is the port of Hang-Chow.

CHAPULTEPEC, a fortress on a mound of rock about 200 ft. high, 2 m. s.w. of the city of Mexico. In the war with the United States this fortress, one of the chief defenses of the city of Mexico, was taken (Sept. 12, 1847) by Gen. Scott, and the city itself was captured the next day.

CHARACEÆ, aquatic plants, forming, according to some botanists, a distinct natural order of acotyledonous plants; according to others, a sub-order of *algæ*. Their stems are tubular, consisting either of a single tube, or of parallel tubes, a central one with smaller ones applied to its surface; they are either pellucid or incrustated with carbonate of lime, which is not to be regarded as a mere accidental incrustation, but belongs to their proper structure; and they have whorls of symmetrical tubular branches. They grow in stagnant waters, both fresh and salt, are always submersed, and often completely conceal muddy bottoms. A number of species are natives of Britain, all belonging to the genus *chara*. The organs of reproduction are of two kinds—lateral *globules*, and axillary *nucules*. These organs have caused no little difficulty to botanists; the nature and use of the globules in particular being by no means well understood. The simple cellular structure of the C., apart from all consideration of their reproductive organs, associates them with the lower *algæ*, rather than with phanerogamous plants. None of them is of any known use. It was in the C. that the beautiful phenomena of *cyclosis* (q.v.) were first observed. Sir David Brewster discovered that each of the minute calcareous particles incrusting the C. possesses double refraction, and has regular neutral and depolarizing axes.

Fossil Characeæ.—The calcareous incrustation which covers the organs of reproduction, as well as the stems of some C., has, from its power of resisting decomposition, caused the abundant preservation of this order in the tertiary fresh-water strata. The nucules originally described under the name of *gyrogonites*, and supposed to be foraminiferous shells, have been noticed by E. Forbes in strata as old as the middle Purbeck beds. No remains of these have been observed in newer deposits, until we find them in the tertiaries. The nucules, associated with *lymnæa* and *planorbis*, are very abundant in the eocene Bembridge beds (q.v.).

CHARACINIDÆ. See SALMONIDÆ.

CHARACTER (Gr. *charasso* or *charatto*, which signifies to scrape, cut, or engrave) means what is engraven on an object, either physically by the action of another external object or objects, or morally by the passions, the affections, by good or evil fortune, and by what we designate generally as "circumstances." In art, the expression of C., either in animate or inanimate objects, is, after correct delineation, the most important matter to be attended to. Though, properly speaking, all distinguishing marks are included under it, it is more generally used to designate those which mark individual from individual, than species from species, or genus from genus.

CHARACTERISTIC. See LOGARITHMS.

CHARACTER TO SERVANT. The general rule is that false statements, whether oral or written, made by one person concerning another, and resulting in injury, though uttered without any wrongful motive, give rise to a cause of action for damages. But a former master, who acts with honest purpose and states only what he believes to be true, may give a character to a discharged servant or to one voluntarily quitting his employment, and incur no liability, even though the communication be prejudicial and false. Such statements are embraced within that class of communications which are said to be conditionally privileged. (See LIBEL; MALICE; SLANDER.) The conditional elements are that the master must act in good faith, and must make the communications to those only who are properly interested in them, such as persons who contemplate employing the servant. If a false character be given maliciously, it will render the master liable. And by malice is here meant actual malevolent notice and evil intent. If made to strangers who have no interest in knowing the character of the servant for the purpose of hiring or dealing with him, the communication is not privileged. The master is under no legal obligation to give a character to his servant; but if, having done so, he discovers that he was mistaken, he should at once make known the truth to the person to whom the character was given. If he does not exercise due care and accuracy in making such communications to persons properly entitled to inquire, and injury to such persons result, he will be legally responsible. The master need not wait to be questioned concerning the servant's character. He may, provided he acts *bona fide*, affirmatively intervene and give information to one about to hire the servant. In actions by a servant for libel or slander growing out of these communications, the burden of proving falsehood and actual malice on the part of the master rests upon the plaintiff.

CHARADE, or "syllable-puzzle" as the Germans call it, is an amusement which consists in dividing a word of one or more syllables into its component syllables, or into its component letters, predicating something of each; and then, having reunited the whole, and predicated something of that also, the reader or listener is asked to guess the word. As a specimen of the C. depending upon syllables, we adduce the following:

"My *first* is plowed for various reasons, and grain is frequently buried in it to little purpose. My *second* is neither riches nor honors, yet the former would generally be given for it, and the latter are often tasteless without it. My *whole* applies equally to spring, summer, autumn, and winter; and both fish and flesh, praise and censure, mirth and melancholy, are the better for being in it. Ans. *Sea-son*."

As a specimen of the second class of charades, we take the following happy example from the French:

"Quatre membres font tout mon bien,
Mon dernier vaut mon tout, et mon tout ne vaut rien."

The word is *zéro*. It is composed of four letters, of which the last—viz., *o*, is equal to *zero*; the whole, zero itself, being equal to nothing.

But besides charades of this nature, there is another kind rather popular at evening-parties—the *acted C.*: the character of which is entirely dramatic. Half a dozen or so of the company retire to a private apartment, and there agree to select a certain word, as the subject of the *C.*; let us suppose *INNKEEPER*. The next thing done is to take the first syllable, *INN*, and arrange a little scene and dialogue, each member taking a certain part. This being accomplished, the amateur actors return to the drawing-room, and commence their performance, the rest of the company constituting the spectators. Care is taken to mention conspicuously, and yet not obtrusively, in the course of the dialogue, the word *INN*, which is the subject of the scene. On its conclusion, they again retire, and devise a new series of incidents for the word *KEEPER*, generally something in connection with a menagerie or a madhouse. This being also represented, they retire for a third time, to contrive the final scene, into which both words, or rather the whole word, *Innkeeper*, must be dexterously introduced at an odd moment when the spectators are thought to be off the scent. The company are then asked to guess the word. In order to the effective performance of a *C.* of this sort, the actors must possess a good share of inventiveness, self-possession, and ready talk, as the greater portion of the dialogue has to be extemporized.

CHARADRI'ADÆ, a large family of birds, of the order *grallatores*, and tribe *pressirostres*, chiefly abounding in the temperate parts of the old world, and generally frequenting sandy unsheltered shores and open moors and downs. They have a short bill, generally soft at the base, hard and often a little inflated towards the tip; long and powerful wings; long legs; and short toes, generally only three in number, and all directed forward, but sometimes they have also a very small hinder toe. They run with great swiftness; they generally congregate in flocks, at least during certain parts of the year; many of them are nocturnal in their habits; many are migratory. The plovers (*chaadrius*) have given their name to the family, which includes also lapwings, pratincoles, oyster-catchers, turnstones, sanderlings, etc.

CHARBAR, or **CHOUBAR BAY**, a harbor in the Indian Ocean on the coast of Beloochistan; 25° 16' n., 60° 35' east. The town of Charbar at the entrance is garrisoned by the sultan of Oman. Near by are the ruins of the early Portuguese settlement of Tees.

CHARBON ROUGE, or **RED CHARCOAL**, is a variety of charcoal obtained by subjecting wood to the action of heated air from furnaces, or of steam, which has been raised to a temperature of 572° F. Air-dried wood, by the ordinary process of charring, yields at the best 21 to 26 per cent of black charcoal; but when acted on by heated air or steam, as mentioned above, 36 or 42 per cent of *C. R.* is obtained. It is now prepared largely in France and Belgium, and is used in stoves for heating, and in the preparation of gunpowder. It has a dark-red color, and consists of about 75 per cent pure carbon, and 25 per cent hydrogen and oxygen.

CHARCAS. See **CHUQUISACA**.

CHARCOAL is a popular term applied to charred wood, or coal produced by charring wood. There are several other varieties of *C.*, however, for which see **BONE-BLACK**; **CARBON**; **COKE**; **LAMP-BLACK**; **WOOD CHARCOAL**.

CHARCOAL BLACKS are made both from animal and vegetable substances—e.g., burnt ivory, bones, vine-twigs, peach-stones, nut and other shells, the smoke of rosin condensed, etc. Those which are derived from vegetable substances, when mixed with white, are usually of a blue tint. See **LAMP-BLACK**.

CHARCOT, **JEAN MARTIN**, was born at Paris in 1825, obtained his degree of M.D. in 1853, and in 1856 was appointed physician to the Central Bureau of Hospitals. His reputation is due in great measure to his investigations into the maladies of the nervous system. In 1873 he was elected a member of the Academy of Medicine in the section of pathological anatomy. His various works are entitled: *De l'Expectation en Médecine* (1857); *De la Pneumonie Chronique* (1860); *La Médecine Empirique et la Médecine Scientifique* (1867); *Leçons Cliniques sur les Maladies des Vieillards* (1868); *Leçons sur les Maladies du Système Nerveux* (1873); *Leçons sur les Maladies du Foie, des Voies Biliaires et des Reins* (1877); *Leçons sur les Maladies du Système Nerveux faites à Salpêtrière* (1880). M. Charcot also annotated the French translation of Baring Garrod's *Treatise on Gout*. He was one of the directors of the *Archives de Physiologie*, and was decorated with the Legion of Honor. He d. in 1893.

CHARDIN, **SIR JOHN**, 1643–1713; a native of Paris, the son of a jeweler, and bred to the same business; but preferring adventure he traveled in Persia and India in 1665–69. Two years later he made a second and more extended journey of four years. In 1681, he settled in London, and was knighted by Charles II. In 1686, he published a portion of the *Travels of Sir John Chardin into Persia and the East Indies*, etc. The complete account of his travels, however, did not appear until 1711.

CHARENTE, a considerable river in the w. of France, rises in the department of Haute-Vienne, about 14 m. n.w. of Chalus. It first flows n.w. to Civray, where it turns southward into the department of Charente to Angoulême, thence it flows westward past Châteauneuf, Jarnac, and Cognac, and entering Charente-Inférieure, it runs

n.w. past Saintes, and falls into the Atlantic below Rochefort, and opposite the islands Oléron and Aix. This river gives its name to two departments, both remarkable for the productiveness of their vineyards; but the wines are mostly used in the preparation of brandy and liquors.

CHARENTE, a department of France, formed chiefly out of the old province of Angoumois, and situated in lat. $45^{\circ} 10'$ to $46^{\circ} 8' \text{ n.}$, and long. $0^{\circ} 50' \text{ e.}$ to $0^{\circ} 30' \text{ west.}$ Area, about 2294 sq. miles. Pop. '96, 356,236. It is generally hilly, and is watered by the river Charente, above noticed, and its tributaries, the Tardouère and the Bandiat, with the rivers Vienne and Dronne.

CHARENTE-INFÉRIEURE, a maritime department of France, which includes the former province of Angoumois, with the greater part of Saintonge, and a small portion of Poitou. It lies in lat. $45^{\circ} 5'$ to $46^{\circ} 19' \text{ n.}$ and long. $0^{\circ} 7' \text{ e.}$ to $1^{\circ} 13' \text{ west.}$ The bay of Biscay washes its western boundary—the coast-line, which is very broken, measuring about 100 miles. Area, 2635 sq. miles. Pop. 453,455. It is watered on its boundaries by the Sèvre-Niortaise and the Gironde, and in the center by the navigable Charente and the coast-stream Sendre. The surface is level; and the soil—near the coast, intersected by ridges of rock and sand-banks, and protected from the sea by dikes—is mostly chalky and sandy, but very fertile, producing hemp, flax, saffron, and wine in great quantities. The commerce, facilitated by the structure of the coast, and by canals in the interior, is considerable, consisting chiefly of brandy and sea-salt, which is found in the department in great abundance. The oyster and pilchard fisheries are important. The chief harbors are those of Rochefort and La Rochelle, the latter of which is the chief town. C. is divided into the six arrondissements of La Rochelle, Rochefort, Marennes, Saintes, Jonzac, and St. Jean-d'Angely.

CHARENTON-LE-PONT, a t. of France, in the department of Seine, situated on the right bank of the Marne, 5 m. s.e. of Paris. The bridge over the river, which is important from a military point of view, being considered one of the keys of the capital, and which has frequently been the scene of conflicts, is defended by two forts, forming a part of the fortifications of Paris. At the other side of the river is the national lunatic asylum, formerly called Charenton St. Maurice, and now St. Maurice simply. Pop. '91, 15,306.

CHAR'ES, 4th c. B.C., an Athenian general who relieved the Philasians from the siege of the Argives and Arcadians; fought against Oropus; lost the island of Corcyra to Athens; commanded jointly with Chalcas in the social war, and made a successful attack upon Chios, in which Chalcas was killed; led an expedition against and captured Sestos; commanded in Thrace, where his main business was private plundering; and in 338 was one of the Athenian commanders in the battle of Chæronea.

CHAR'ES, a Grecian artist in bronze, a native on Lindus, and the designer of the Colossus of Rhodes, lived in the 3d c. B.C. He was a pupil of Lysippus.

CHARGE, in electricity. See **ELECTRICITY**, **STATIC**.

CHARGE. In the law of Scotland, a C. is a command to perform an act, conveyed in the letters of the sovereign. The same term is applied to a messenger's copy for service, requiring the person to obey the order contained in the letters.

CHARGE, in heraldry. The figures represented on a shield are called charges, and a shield with figures upon it is said to be charged (Fr. *chargé*). The charges in a shield ought to be few in number, and strongly marked, both as regards their character and the mode of their representation. The family shield, belonging to the head of the house, almost always is simpler, i.e., has fewer charges, than the shields of collaterals, or even of junior members.

CHARGE, in military pyrotechny, is sufficient combustible material for one firing or discharge. It is applicable to all kinds of firings, fireworks, and explosions; but the name is generally given to the quantity of gunpowder requisite for firing off a gun, etc. In cannon, this varies greatly, from $\frac{1}{2}$ to $\frac{1}{10}$ of the weight of the shot; some of the rifled ordnance now coming into use are remarkable for the smallness of the C. with which they are fired. The quota of C. will be mentioned in connection with the various kinds of fire-arms described in the *Cyclopædia*. In breaching a wall, a greater C. is necessary than in attacking a ship or a column of troops, even with the same kind of gun and projectile.

CHARGÉS D'AFFAIRES are fourth-class diplomatic agents, accredited, not to the sovereign, but to the department for foreign affairs; they also hold their credentials only from the minister, and are sometimes only empowered by an ambassador to act in his absence.

CHARIOT, in ancient times, was a kind of carriage used either for pleasure or in war. According to the Greeks, it was invented by Minerva; while Virgil ascribes the honor to Erichthonius, a mythical king of Athens, who is said to have appeared at the Panathenæic festival founded by him, in a car drawn by four horses. The ancient C. had only two wheels, which revolved upon the axle, as in modern carriages. The pole was fixed at its lower extremity to the axle, and at the other end was attached to the yoke, either by a pin or by ropes. The Greeks and Romans seem never to have used

more than one pole, but the Lydians had carriages with two or three. In general, the C. was drawn by two horses. Such was the Roman *biga* (q.v.), but we also read of a *triga*, or three-horse C., and a *quadriga*, or four-horse one. The last was that in which the Roman generals rode during their triumphal entrance into the city, and was often adorned with splendid art. The war-chariot held two persons—the soldier himself and the driver, the latter of whom usually occupied the front; but the chariots used by the Romans in their public games held only the charioteer.

The oldest war-chariots of which we read are those of Pharaoh (Exodus xiv. 7). All the eastern nations used them, while we learn from Cæsar (*De Bell. Gall.*, v. 19) that the Britons also were familiar with their use. See illus. EGYPT, vol. V.; ARCHÆOLOGY, vol. I.; NINEVEH AND ASSYRIA, vol. X.

CHARIS'TICARIES, officers (in Greek ecclesiastical history) who had full power over the revenues of hospitals and monasteries.

CHARITABLE USES OR TRUSTS AND LAW OF CHARITIES. A trust for charitable uses, or public trust, has been defined as "A gift, to be applied consistently with existing laws, for the benefit of an indefinite number of persons, either by bringing their hearts or their minds under the influence of education or religion, by relieving their bodies from disease, suffering, or constraint, by assisting them to establish themselves in life, or by erecting or maintaining public buildings or works, or otherwise lessening the burdens of government." It is distinguished from private trust, which includes all other trusts, in that: I., It always exists for charity or public beneficence; II., Its beneficiaries are indefinite and undetermined, and III., It may and usually does create a perpetuity.

I. An enumeration of the charitable objects, for which such trusts may be created and upheld, is found in an English statute passed in the 43d year of Elizabeth. Those objects may be grouped, as appears by the definition given, under four general heads, as follows: (1) Gifts for *strictly eleemosynary* objects, i.e., for charity in its narrow, popular sense, such as gifts for the poor, for sick, disabled, or demented persons, and for hospitals, homes, and asylums. (2) Gifts for *educational purposes*, as for schools and colleges, to build or equip libraries, and to endow scholarships, fellowships, and the like. (3) Gifts for the purpose of *religion*, such as those for the building or repairing of churches, for missions, and for spreading the Gospel. (4) Gifts for *lightening the expenses of government*, such as bequests for the erection of public buildings, docks, wharves, canals, etc.

II. *Indefiniteness in the beneficiaries*, either as to the class to be benefited, or as to the individuals in a determined class who will be the objects of the bounty, is the predominant distinguishing feature of charitable uses or trust. If the beneficiaries be definitely specified, no matter how charitable the object of the gift, it constitutes a private trust and must be construed and governed accordingly. Thus, a trust for the support and comfort of designated persons in a certain hospital would be private, while a trust for all those who should be cared for by such an institution would be public or charitable. This feature of trusts for charity, coupled with the liberal spirit in which courts construe such gifts, has led to the method of executing them, so called, *cy pres* ("as near as"). By this doctrine is meant, that when such gifts cannot be applied according to the precise intention of the donor they will be employed for a purpose as near as possible (*cy pres*) to that which was designated. It assumed two forms in England. In one form it was employed by the chancellor in the exercise of a prerogative, executive power, delegated to him under the sign manual of the Crown, and was carried to the extent of applying a trust for charities to *some* charitable purpose, even when the objects for which it was intended were illegal and void. In its other form, it was exercised by the chancellor in the performance of his *judicial* functions, and was applied only to such charitable trusts as were legal and valid in their inception, but which, because of some change in law or circumstances, could not be carried out in exactly the manner indicated by the donor. In this latter form, but not in the former, the *cy pres* doctrine is recognized and applied in some, though not in all, of the American states, where trusts for charity are allowed. For example, a bequest made before the fall of slavery in the United States, to trustees to be applied to various methods of creating a sentiment against negro slavery in America was applied, after the close of the civil war, by the Massachusetts courts, to the American Freedmen's Union Commission; and in Missouri, trustees having been directed by will to establish *forever* a charitable home upon land devised to them, and a portion of the land having been cut off from the residue by a new street and rendered useless for the building, that portion was ordered by the court to be sold and the proceeds applied to the payment of the debts of the same institution.

III. A trust necessarily suspends, during its continuance, the power of free and unrestrained alienation of property. It is, therefore, restricted by the common law principle and prevalent statutory provisions, which forbid such suspension except for a limited time measured by the lives of one or more individuals. A suspension beyond such a period is known as a *perpetuity*. But, property donated to trustees for charitable purposes may remain in the hands of such trustees for all time, notwithstanding the fact that the absolute power of alienation is thus indefinitely suspended.

Gifts for charitable uses are of considerable antiquity. They were probably known and fostered by the Christian emperors of Rome. They were recognized and enforced by the English court of chancery long before the statutes of 39 and 43 Elizabeth, but by

those statutes they were defined and greatly promoted. In England, the "Charitable Trusts Acts" (passed in 1853, 1855, 1860, and 1869), have formed a species of code of the law of charities and completely changed the method of administering such trusts. In the United States, the statutes of Elizabeth have not been re-enacted; but in many of the states charitable uses are recognized and enforced by the judiciary. In others, as New York, trusts for charity are placed upon the same footing as private trusts.

CHARITON, a co. in n. central Missouri, lying n. and e. of the Missouri and w. of Grand river, and intersected by the Wabash railroad; 740 sq. m.; pop. '90, 26,254, includ. colored. The surface is rolling prairie and forest, with fertile soil. Coal and limestone are found. Chief productions, agricultural. Co. seat, Keytesville.

CHARITON, the author of a romance entitled *The Loves of Chereas and Callirrhoe*, written in Greek about the fourth century, A.D. He is said to have been a native of Aphrodisias in Caria, Asia Minor. Nothing is known about his personal history.

CHARITON, or **GRAND CHARITON**, a river rising in s. central Iowa, and flowing s.e. into Missouri, thence s., joining the Missouri river in Chariton co.; 250 m. long, and navigable about 50 miles.

CHARITY, BROTHERS OF, were a religious order of the Roman Catholic Church, founded at Seville, Spain, in 1540, by St. John of God who in this year began to receive the sick into his house, and to gather about him others who were interested in works of charity and love. The Archbishop of Seville gave the new association his official approval, as did the Pope at a later date. The members of the Order had no distinctive dress until in 1572, Pope Pius V. gave it the habit of the Augustines. The members of the Order were often very skillful in surgery and medicine; and established hospitals and infirmaries in both France and Italy. The Society became almost extinct upon the Continent of Europe in the last century, being superseded by the Sisters of Charity; but in 1828 it was revived in England by Cardinal Rosmini-Serbatl.

CHARITY, SISTERS OF. An organization founded at Châtillon in 1633 by St. Vincent de Paul and a French lady, Mme. de Gras, with the object of caring for the poor, the infirm, and the sick, and for the education of young children. The institution was formally approved by the Archbishop of Paris in 1655, and free schools, hospitals, almshouses, and prisons were placed under their especial charge. The order soon had representatives in other countries, and in 1660 was approved by the Pope. Under the First Empire, Napoleon placed the Sisters under the protection of his mother. The vows taken are simple and renewed every year. In the United States, the Congregation first maintained a branch in 1809, when Mrs. Eliza Ann Seton established a foundation at Emmettsburg, Md. There are more than 175 houses of this noble Sisterhood in this country.

CHARIVARI is a French term used to designate a wild tumult and uproar, produced by the beating of pans, kettles, and dishes, mingled with whistling, bawling, groans, and hisses, and got up for the purpose of expressing a general dislike to the person against whom it is directed. The etymology of C. is obscure; the Germans translate it by *Katzenmusik*, the English of which is *caterwauling*. In France, during the middle ages, a C. was generally raised against persons contracting second nuptials, in which case the widow was specially assailed. On these occasions, the participators in it, who were masked, accompanied their hubbub by the singing of satirical and indecent verses, and would not cease till the wedding couple had purchased their peace by ransom. C. answers to the English concert upon "marrow-bones and cleavers," with which it was customary to attack a married couple who lived in notorious discord. It was also got up against an unequal match, such as where there was great disparity in age. See SKIRMERTON.

Similar customs seem to have existed under different names in all parts of Europe, and sometimes they were of such a licentious and violent character as to require military interference to put them down. Even as early as the 14th c., the church found itself forced to threaten punishment, and even excommunication, against those who participated in them. In more recent times, the C. has taken a purely political coloring; as, for example, during the restoration in France, at which time, however, the popular voice began to seek vent by casting its satirical darts against public men through the press. The papers published for this purpose were called C., the most famous among which is the *Charivari*, which was established in Paris, Dec. 2, 1832, corresponding to the English publication, *Punch* (q.v.).

CHARKOV. See KHARKOV.

CHARLATAN, a mountebank, quack-doctor, or empiric, and hence any one who makes loud pretensions to knowledge or skill that he does not possess. The word seems to be derived from the Ital. *ciarlare*, to babble or talk, the chief art of the C. consisting in talk. Charlatanism abounds in all departments of life, and manifests itself in various ways according to the subject and character of the person. It changes also in form with the spirit of the time. The medical C. no longer appears on a stage in the guise of Dr. Ironbeard, but as a fine-dressed gentleman, receiving grateful acknowledgments through the newspapers, and publishing popular medical books, with the address of the author, and recommendations to apply to him. It has not infrequently happened, however, that extraordinary men who were so far before their age as not to be understood by it, such as Paracelsus, have passed for charlatans until more justly esti-

mated by later times. Several books have been written on the charlatanism of scholars. J. B. Mencke's satire, *De Charlataneria Eruditorum* (Leip. 1715), is a classical work, which has been continued by Büschel in his book, *Ueber die Charlatanerie der Gelehrten seit Mencke*.

CHARLEMAGNE, i.e., Charles the Great, king of the Franks (768-814 A.D.), and Roman emperor (800-814 A.D.), was b. on 2d April, 742, probably at Aix-la-Chapelle, and was the son of Pepin the Short, the first Carolingian (q.v.) king of the Franks, and grandson of Charles Martel (q.v.). On Pepin's death in 768, he and his brother Carloman jointly succeeded to the throne. By Carloman's death, and the exclusion of both his sons from the throne, C. became sole king. In 772, it was resolved in the diet at Worms to make war against the Saxons, for the security of the frontiers, which they continually threatened, and for the extension of the Christian religion. C. advanced as far as the Weser in 772, securing his conquests by castles and garrisons. Pope Adrian I. now called him to his aid against Desiderius, king of the Lombards. C. had married the daughter of Desiderius, and had sent her back to her father because she bore him no children, and married Hildegarde, daughter of the Swabian duke, Godfrey. Desiderius had sought revenge by urging the pope to crown the sons of Carloman, and on the pope's refusal, had laid waste the papal territory. C. crossed the Alps from Geneva, with two armies, by the Great St. Bernard and Mont Cenis, in 773, and overthrew the kingdom of the Lombards in 774. The Lombard dukes acknowledged him as their king, and he secured the pope's favor by confirming the gift which Pepin had made to the papal see, of the exarchate of Ravenna. In 775, he was again employed in the most northerly part of his dominions, reducing the Saxons to subjection; in 776, he suppressed an insurrection in Italy; in 777, he so completed his victory over the Saxons, that their nobles generally acknowledged him as their sovereign in an assembly at Paderborn. Being now invited to interpose in the wars of the Arabs and Moors in Spain, he hastened to that country in 778, and added to his dominions the regions between the Pyrenees and the Ebro. From Spain he was summoned in haste by a new insurrection of part of the Saxons, who had advanced almost to Cologne, but whom he drove back to the Elbe. In 781, he went to Italy, where the pope crowned his second son, Pepin, king of Italy, and his third son, Louis, an infant of three years old, king of Aquitaine. The Saxons once more rising in arms, defeated and destroyed a Frankish army on the Süntel in 782, which C., after a new victory, fearfully revenged by causing no fewer than 4500 prisoners to be executed as rebels in one day. A more general rising of the Saxons followed, but in 783-85, the Frankish monarch succeeded in reducing them completely to subjection, and in persuading their principal chiefs to submit to baptism, and to become his faithful vassals. Subsequent insurrections and wars in Germany, between this year and 800, resulted in victories over the Bulgarians and Huns, and in the further consolidation and extension of his empire, the eastern boundary of which now reached to the Raab.

In 800, C. undertook an Italian campaign, which was attended with the most important consequences. Its immediate purpose was to support pope Leo III. against the rebellious Romans. When C., on Christmas day, 800, was worshipping in St. Peter's Church, the pope unexpectedly, as it appeared, set a crown upon his head, and, amidst the acclamations of the people, saluted him as Carolus Augustus, emperor of the Romans. Although this added nothing directly to his power, yet it greatly confirmed and increased the respect entertained for him, such was still the lustre of a title with which were associated recollections of all the greatness of the Roman empire. A scheme for the union of the newly revived western empire with the empire of the east, by C.'s marriage with Irene (q.v.), the Byzantine empress, failed by reason of Irene's overthrow. After this, C. still extended and confirmed his conquests both in Spain and in Germany. He labored to bring the Saxons to a general reception of Christianity, and founded bishoprics for this purpose. To the end of his reign, he was incessantly engaged in wars, and insurrections were always apt to break out in the frontier parts of his dominions; which he endeavored to secure, however, not only by military power and arrangements, but by improvements in political and social institutions. His views were liberal and enlightened to a degree rare for many subsequent ages. Whilst he made the power of the central government to be felt to the utmost extremities of his empire, he recognized in his subjects civil rights, and a limitation of monarchic power by their assemblies. He zealously endeavored to promote education, agriculture, arts, manufactures, and commerce. He projected great national works, one of which was a canal to connect the Rhine and the Danube; but he deemed nothing beneath his attention which concerned the interests of his empire or of his subjects. He required his subjects to plant certain kinds of fruit-trees, the cultivation of which was thus extended northward in Europe. His own domains were an example of superior cultivation. He had a school in his palace for the sons of his servants. He built sumptuous palaces, particularly at his favorite residences, Aix-la-Chapelle and Ingelheim—for he had no fixed capital—and many churches. Learned men were encouraged to come to his court. He himself possessed an amount of learning unusual in his age; he could speak Latin and read Greek. He attempted to draw up a grammar of his own language. C. was of more than ordinary stature, and of a noble and commanding appearance. He was fond

of many exercises, particularly of hunting. He was too amorous, but in eating and drinking he was very moderate. His fame spread to all parts of the world: in 768, Harun-al-Raschid sent ambassadors to salute him. He enjoyed good health till shortly before his death, 28th Jan., 814. He was buried at Aix-la-Chapelle (q.v.), in a church which he had built there. He was succeeded by his son Louis, styled Louis le Débonnaire, the only one of his sons who survived him; but the greatness of his dynasty terminated with his own life. C. is styled Charles I. in the enumeration both of the French kings and of the German or Roman emperors. Besides his *capitularies* (q.v.), there are extant letters and Latin poems ascribed to him. His life was written by his secretary, Eginhard.

CHARLEMONT. See GIVET.

CHARLEROI, a Belgian t. and fortress in the province of Hainaut, stands on the Sambre, between Mons and Namur, on the line of the Brussels and Namur railway. The pop. is (1890) 21,879, who carry on considerable manufactures in hardware, glass, woolen-yarn, etc. The district is rich in coal, and the number of smelting-furnaces and nail-factories in the neighborhood is very great. The ironworks of Couillet, which yield a third of all the cast-iron produced in Belgium, lie within a mile or two of the town. C. possesses considerable historical and political interest as a fortress. The fortifications were begun by the Spaniards in 1666, but falling into the hands of the French next year, they were completed by Vauban. After six exchanges of masters between the French and Spaniards, the peace of Aix-la-Chapelle, 1748, left C. in the possession of Austria. In 1794, after a protracted and desperate resistance, it was surrendered to the French by capitulation, when the fortifications were demolished. The importance of the place in a strategic point of view having become apparent during the campaign of 1815, the fortifications have been since restored.

CHARLES, a co. in s.w Maryland, between the Potomac and Patuxent rivers; 460 sq.m.; pop. 15,191, inclu. colored. Surface uneven, with forests of locust, oak, ash, chestnut, and cedar. Tobacco is the main production. Co. seat, Laplata,

CHARLES I., King of England, Scotland, and Ireland (1625–49), was b. at Dunfermline, 19th Nov., 1600, and was the second son of James I. of England (VI. of Scotland). On the death of his elder brother, Henry, in 1612, he became prince of Wales, and heir-apparent to his father's throne; to which he succeeded in 1625, but found both in England and Scotland a contest in progress between king and people. He had inherited from his father the most extreme notions of kingly prerogative, and he mistook the general movement in the public mind for an agitation amongst a few disaffected persons. He had deeply imbibed his father's notion, that an Episcopal church was the most consistent with the proper authority of kings; and he adopted severe and persecuting measures against the Puritans in England and the Presbyterians in Scotland. He married a Roman Catholic, Maria Henrietta of France, a marriage most displeasing to the nation; and even so far despised public opinion as to make his father's favorite, the duke of Buckingham, his prime minister and chief adviser. The English parliament, which he assembled in 1625, was resolved upon the vindication of the national liberties, and was therefore very sparing in its grants of subsidies, while that of 1626, instead of freely granting supplies, resolved upon the impeachment of Buckingham; whereupon the king threw into prison two of the boldest members, Elliot and Digges; dissolved parliament; and, to procure money, had recourse to the arbitrary measures of forced loans, and a tax upon the seaports (*ship-money*), imposed by the mere exercise of royal authority. By all this, public feeling was more and more embittered. In 1628, C. found it necessary again to summon a parliament; and the parliament, very resolute to maintain the liberties of the nation, presented the petition known in history as the *Petition of Rights* (q.v.). C. temporized, conceded, and finally, although the assassination of Buckingham had removed one cause of strife, assumed a threatening tone, and dissolved the parliament, 10th Mar., 1629. He even caused some of the leading members of the house of commons to be imprisoned. He now governed for 11 years without a parliament, having Laud (q.v.) and Strafford (q.v.) for his chief advisers, and obtaining for his edicts the semblance of a legal sanction by means of the star chamber (q.v.). All this while, the storm was gathering, the love of liberty increased, and republican principles were developed and extended. The policy which C. adopted was that of more severe repression. At length, in 1638, Scotland assumed an attitude of determined resistance to the imposition of a liturgy and of Episcopal church-government. The national covenant (q.v.) was subscribed, Presbyterianism was completely restored; and in 1639, the king having assembled an army for the purpose of reducing Scotland to subjection, the Scottish covenanters also took up arms, and advanced to the English border, many of the English regarding their approach with joy. Civil war was, however, prevented for the time, by concessions on the part of the king. Unable to do without supplies any longer, C. summoned an English parliament in 1640, which, instead of listening to his demands, began to draw up a statement of public grievances. C. soon dissolved the parliament, and assembled an army to resist the Scots, who had again taken up arms and entered England; but his army was defeated by them at Newburn-upon-Tyne, and they advanced southward, with the sympathy and good wishes of no small part of the king's English subjects. Much against his will, C. was now compelled again to call a parlia-

ment, whose memorable sittings began on 3d Nov., 1640. Both houses were resolute in their opposition to his despotism. They began by the impeachment of the ministers and high officers of state, and declared the decrees of the star chamber and court of high commission to be null and void. They passed a bill in favor of triennial parliaments; and the king, in trepidation, gave it his assent. He also consented, although against his own convictions, to the execution of Strafford; and even gave his assent to an act which provided that the present parliament should not be dissolved, prorogued, or adjourned, without its own consent. Hoping to win the favor of the Scots, he now visited Scotland; but whilst he was there, a rebellion broke out in Ireland, accompanied with a fearful massacre of Protestants. The prospect of a peaceful accommodation was now almost destroyed; the English parliament enlarged its demands; the king, after seeming to yield, took the extraordinary step of suddenly, on 4th Jan., 1642, appearing in the house of commons, accusing five members—Pym, Hampden, Hollis, Hazelrig, and Stroud—of high treason, and demanding that they should be delivered up to him. Both houses of parliament espoused their cause, and the city of London showed a determination to defend them by arms. C. left London with his family, and the parliament declared the kingdom in danger. Civil war began; the royalists had at first the advantage, but the national feeling was with the parliament. Negotiations were from time to time opened or renewed, but always in vain. After the battle of Naseby, on 15th June, 1645, in which his army was almost annihilated by the parliamentary troops under Fairfax and Cromwell, C. was compelled to seek refuge in the Scottish camp. Negotiations still proving fruitless, he was delivered up to the English parliamentary army. Negotiations were still attempted with C. in his captivity; but resulted in nothing. Finally, C. fled, was taken, refused the ultimatum of the army, and so enraged Cromwell and the Independents, that parliament was obliged to pass an act declaring all negotiation with the king to be treason. The Presbyterians of England and the Scots, who were always haunted by the idea that there was something sacred and inviolable in monarchy, thought to rescue the king from the hands of the Independents, but were defeated, and all the Presbyterians were forcibly expelled from the English house of commons, which now consisting only of about 60 members—the *Rump parliament*—appointed a court composed of persons from the army, the house of commons, and the city of London, to try the king. The court was opened with great solemnity in Westminster hall on 20th Jan., 1649. About 70 members took part in its proceedings. On the 27th of Jan., C. was condemned to death as a tyrant, murderer, and enemy of the nation. The Scots protested, the royal family entreated, and the court of France and states-general of the Netherlands interceded, but in vain. On 30th Jan., 1649, he was beheaded in front of the palace of Whitehall. In his last hours he showed great calmness and presence of mind. In his private character, C. was a man of cultivated mind, kind, and of irreproachable life; but in political affairs he was unscrupulous, and had recourse to dissimulation and falsehood for the accomplishment of his purposes. In the estimation of many who do not condemn it on moral grounds, his execution was a great political blunder. From the restoration of Charles II., the 30th of Jan. was observed in the church of England with special religious services, as the day of *king Charles the Martyr*. This commemoration, offensive to great part of the community, and of the members of the established church itself, was abolished by act of parliament in 1859.

CHARLES II., King of England, Scotland, and Ireland (1649–85), the eldest son of Charles I., was b. 29th May, 1630, and went with his mother to France during the civil war. He was at the Hague at the time of his father's execution, and immediately assumed the title of king. He meditated an expedition to Ireland for the assertion of his claims, when the Scots offered him their crown in 1650, and proceeding to Scotland, he was crowned at Scone in the beginning of 1651. The limitations, however, under which he received the crown, were disagreeable to him, and he hated the restraint put upon his inclinations by the Presbyterian clergy. After the defeat of the Scots at Dunbar, he put himself at the head of their army, in hope of rousing the royalists of England to his support; but was completely defeated by Cromwell, at Worcester, on 3d Sept., 1651. He made his escape, amidst many dangers, to France, where his situation was by no means agreeable, and from which he went to Cologne, and afterwards to the Netherlands. After Cromwell's death, the desire of the English for a settled government leading to the restoration of the house of Stuart, he landed at Dover, on 26th May, 1660, was received with acclamation by the people, and ascended the throne almost untrammelled by a single condition. He was surrounded by men of extreme party-feeling, among whom the most influential was the chancellor, Clarendon (q.v.). The persons immediately concerned in the death of Charles I. were brought to the scaffold; Episcopacy was restored; and the Presbyterians and other non-conformists, both in England and Scotland, were subjected to great hardship and persecution. The king was extravagant, and soon found himself in want of money: he married the princess Catharine of Portugal, for the sake of her large dowry; he shamefully sold Dunkirk and Mardyke to the French; and for a pecuniary consideration, agreed to make war against the united provinces, although such a war was contrary to all the feelings of the English people and the interests of English commerce. The Dutch fleet, under De Ruyter,

entered the Thames, and C. was compelled to make an ignominious peace. After the fall of Clarendon, the ministry known as the Cabal (q.v.) ministry came into power—a ministry hateful to the country, composed of unprincipled men, and bent upon the restoration of popery and absolute monarchy. C. sought to conciliate the people by the *triple alliance*, in May, 1668, with Sweden and the states-general; but the French court soon found means to persuade him again to make war against the united provinces. He basely accepted pecuniary gifts and a pension from the French government; and, as even this, with all that he could get from his parliament, was insufficient for his expenses, he had recourse to illegal means of raising money. The story of the *popish plot* (see OATES) against the king's life caused prodigious excitement amongst the people, and lord Stafford and many other persons were most unjustly brought to the scaffold. The parliament of 1679, very much against the will of the court, enacted the celebrated *habeas corpus act* (q.v.); and a bill was under consideration for the exclusion of the king's brother, the duke of York, from the throne, on account of his avowal of the Roman Catholic religion. The king, at this period of his reign, had, however, completely crushed the Presbyterians of Scotland, and was more absolute than any of his predecessors had been on either of the British thrones. Most arbitrary measures were adopted. The city of London was deprived of its privileges, because of the election of a sheriff disagreeable to the court. The *Rye-house plot* (q.v.), a widely-extended conspiracy, and in which the king's natural son, the duke of Monmouth (q.v.), was concerned, was discovered in 1683, and cost the lives of a number of persons, amongst whom were lord Russell and Algernon Sidney. C., however, appears to have recognized the necessity of a more liberal policy, when he was unexpectedly carried off by death, on 6th Feb., 1685. In his dying hours, he called in the assistance of a Roman Catholic priest, although he had not previously avowed his attachment to that religion. His reign was full of events dishonorable to his country, and of which he himself was generally the cause. His life was most dissolute; his adulteries, and the profligacy of his court, scarcely paralleled in British history. He had an affability, however, which won for him a certain sort of popularity.

CHARLES I., THE BALD, 823-77; King of France and emperor of the Romans, son of Louis le Debonnaire by his second wife, Judith. The father, in order to furnish C. a kingdom, took away portions of the territory of the other sons, and war among them followed, which ended in leaving C. in possession of a large kingdom in the w. part of the empire. When Louis died, C. undertook to succeed him as the emperor, and made an alliance with his brother Louis, the German. In 841, C. defeated his rival and eldest brother, Lothaire. In 843, the treaty of Verdun confirmed C. in possession of the kingdom, which comprised all France west of the Meuse, Saone, and Rhone, and Spain from the Ebro to the Pyrenees. But the government of C. was weak; the Norsemen pillaged the country almost without resistance; and finally the people, in despair of relief, called in the aid of his brother Louis, who drove C. from the country for a time. But C. had the church on his side, being entirely under control of the bishops, and in 875 he was crowned emperor by the pope. Louis was too strong for him, however, and he never to any great extent recovered his power. He died in 877, near mont Cenis, while on his way against the Saracens at the request of the pope.

CHARLES II., THE FAT, 832-88; King of the Franks and emperor of the Romans, third son of Louis the German. From his father, C. inherited Swabia; in 880, the death of his brother Carloman of Bavaria made him king of Italy; in 881, he was crowned emperor; the death of Louis of Saxony in 882, also a brother, brought him all Germany; and that of Carloman, the French king, in 885, left him all France; and so by no effort of his own, but by natural causes solely, C. became sovereign of all the dominions of Charlemagne. But he was a weak, gluttonous creature, more intent upon the pleasures of the table than upon matters of state. The Norsemen sailed up the Seine and laid siege to Paris, and C., instead of making even an attempt at resistance, bought them off with 700 pounds of silver and a free passage to the upper Seine and Burgundy, where they might ravage at will. In 887, C. was deposed by his people, and died the next year in a cloister.

CHARLES III., THE SIMPLE, 879-929; King of France; posthumous son of Louis the Stammerer. By the death of his rival, Charles the Fat, in 887, he obtained possession of the whole kingdom. The most conspicuous act of his reign was the cession to the harassing Norsemen of the territory afterwards known as Normandy, on condition that the heathen should be baptized, that Rollo (Hrolf Ganger, or Ralph the Walker, a Danish pirate chief, and the ancestor of William the Conqueror, of England) should marry Charles's sister, and become a duke and vassal of the crown. In 922, the barons rebelled against Charles, and elected Robert, brother of the previous king, in his place; but Robert was killed by Charles's own hand in the battle of Soissons, though that did not secure to him the victory. The barons then chose for King Raoul, duke of Burgundy. After many failures, misfortunes, and a long imprisonment, Charles died at Peronne.

CHARLES IV., THE FAIR, 1294-1328; King of France and Navarre; third son of Philip the Fair, succeeded his brother Philip V., in 1322. The chief purposes of his policy were to free the country from the Lombards, and from the exactions of the barons.

and the judges. He also did something towards improving the condition of the Jews, and assisted his sister Isabella in her contest with her husband, Edward II. of England. In 1325, being supported by the pope, Charles made an unsuccessful effort to attain the imperial crown.

CHARLES V., surnamed **THE WISE**, King of France (1364-80), was the son of king John, and was b. on 21st Jan., 1337. His father being made prisoner by the English at the battle of Poitiers, on 19th Sept., 1356, he assumed the regency. The most significant events which occurred under his rule, were the vigorous efforts of the *bourgeoisie* to deliver themselves from the tyranny of the nobles and the court, and the peasant war called the *Jacquerie* (q.v.). His father dying, 8th April, 1364, C. ascended the throne, and by his cautious policy rescued the kingdom from some of its troubles, and re-established the power of the crown, which had been much shaken. War with England raged for a number of years, but with results highly favorable to C., who stripped his enemies of all their conquests in France, except a few fortified places. He died 16th Sept., 1380. C. was fond of books and the company of learned men, but was not above the natural weakness of kings for outward pomp and magnificence.

CHARLES VI., King of France (1380-1422), b. at Paris, 3d Dec., 1368, was the son and successor of Charles V. He was only 13 years of age when his father died. For several years, his uncle, the duke of Anjou, acted as regent. In 1388, C. took the reins of government into his own hand, but during his life-time was so often afflicted with insanity, that party strife raged without much check. The two great families whose influence divided the nation, were those of Orleans and Burgundy. It was the Orleans party which called in the assistance of the English, and brought about the battle of Agincourt, so disastrous to the French nation. Subsequently the Burgundians allied themselves to the English, who laid waste the whole of northern France. In the midst of these calamities, C. died, 21st Oct., 1422.

CHARLES VII., King of France (1422-61), the son and successor of Charles VI., was b. on 22d Feb., 1403. On his father's death he was at the head of an army, with which he held possession of the southern provinces of the kingdom; Paris and the north being in the hands of the English, who proclaimed Henry VI. of England king of France, and appointed the duke of Bedford regent. For some time the events of war were unfavorable to C., who was compelled, in 1424, to evacuate Champagne, and, in 1425, Maine. In 1426, the count Dunois gained the first victory over the English at Montargis; but in the year following they besieged Orleans, a place of great importance to C., as securing a connection with the north, and he was roused to fresh energy. At this time, also, Joan of Arc (q.v.), the maid of Orleans, by her wonderful courage and confidence of a heavenly mission, roused the fervor both of nobles and people. The siege of Orleans was raised in May, 1429; the English retired disheartened, and gradually lost their acquisitions in France. A treaty between the French king and the duke of Burgundy greatly advanced the French cause. In 1436, C. entered Paris; and during the further progress of the war, the English lost all their strongholds except Calais. In 1452, they were finally defeated at Castillon. After he was established on his throne, C. devoted himself to the reorganization of the government, in which everything had fallen into confusion, but showed a strong anxiety to frame it according to a scheme of perfect despotism, and for this purpose to provide himself with a powerful and well-disciplined standing army, which caused some discontentment among the nobles of his kingdom. His government, however, was mild, and under it France recovered in some measure from the effects of the terrible calamities which it had endured. His last years were embittered by the conduct of his son, the dauphin, afterwards Louis XI.; and his apprehension that his son would poison him was so strong, that his consequent abstinence from food is supposed to have hastened his death, which took place at Melun on 22d July, 1461.

CHARLES VIII., King of France (1483-98), was b. at Amboise on 30th June, 1470, and succeeded to the throne on the death of his father, Louis XI. For some time the government was carried on under the regency of his sister, Anne of Beaujeu. When C. attained his 21st year, he took the royal power into his own hand, and soon developed a bold and ambitious spirit. The most important incident of his career was his conquest of Naples in 1495, to the throne of which he believed he had a claim. The Italian princes and other European potentates were alarmed by his success. A league was hastily formed between the pope, the emperor of Germany, Ferdinand of Spain, the republic of Venice, and Sforza, duke of Milan, to oppose his return to France. C., however, gallantly broke through the allied forces near Piacenza, and effected a retreat to his own country. It was with difficulty he was hindered by his councilors from resuming his warlike designs on Italy. C. is also said to have meditated the expulsion of the Turks from Europe, and making himself emperor of Constantinople; having received from Andreas Palæologus, the grandson of the last Grecian emperor, a transference of his claims to the Byzantine throne. He died 7th April, 1498.

CHARLES IX., King of France (1560-74), the second son of Henry II. and of Catharine de Medici (q.v.), was b. at St. Germain-en-Laye on 27th June, 1550, and on 5th Dec., 1560, succeeded to the throne on the death of his brother, Francis II. His char-

acter was a compound of passion, acuteness, heartlessness, and cunning. Although only 24 years of age when he died, so well had his detestable mother trained him to a love of perfidy and cruelty, that he found time, with her assistance and that of the Guises, to perpetrate an act so hideously diabolical, that all civilized Europe still shudders at the recollection. The massacre of St. Bartholomew's (q.v.), 24th Aug., 1572, was the culmination of a series of treacheries towards the Huguenots, which disgraced his reign. The result was, that civil war broke out anew, and assumed a very threatening character, as political malcontents associated themselves with the Protestants. C. died May 30, 1574.

CHARLES X., King of France (1824-30), third son of the dauphin Louis, and grandson of Louis XV., was b. at Versailles, 9th Oct., 1757. He received the title of count d'Artois, and in 1773 married Maria Theresa of Savoy. After the events of 14th July, 1789, he and the prince of Condé took the lead of the emigration. In 1796, he sailed from England with a squadron under commodore Warren, on an expedition to the western coasts of France, whereupon twenty departments rose in insurrection; but he had not courage to land and place himself at the head of the insurgents, whom he basely left to the vengeance of the republicans. Detested now by the royalists of France, and despised by the British, he lived in obscurity until the allies entered Paris in 1814, when he appeared in France as lieutenant-general of the kingdom, and issued a proclamation announcing the end of despotism, of conscriptions, and of oppressive taxes. After the second restoration, he took little open part in politics, but lived surrounded with priests, Jesuits, and nobles of the old school; and in this circle originated the tyrannical and unconstitutional measures to which even Louis XVIII. made considerable opposition, but which at this time disgraced the government of France. The death of Louis, on 16th Sept., 1824, brought C. to the throne. He took the oath of adherence to the charter, but soon displayed his intention of restoring as much as possible the absolutism of the old French monarchy. Popular discontent rapidly increased. A royal speech, of a threatening character, on 2d Mar., 1830, was followed by an address of remonstrance, signed by 221 deputies, upon which the king dissolved the chambers. The deputies who signed the address were all re-elected, but the court taking fresh courage from the success of the expedition to Algiers, the celebrated ordinances of 25th July were signed by the king, putting an end to the freedom of the press, already largely curtailed, appointing a new mode of election, and dissolving the recently elected chamber. The capital took up arms, the guards refused to act, and the king soon found himself compelled to flee. As a last resource, he abdicated the throne, on 2d Aug., 1830, in favor of his grandson, Henry, duke of Bordeaux, the dauphin also consenting to this act. But it was too late; the revolution was accomplished, and Louis Philippe, duke of Orleans, was chosen king of the French. C. made his escape to England, resided for some time at Holyrood, and afterwards at Prague. He took no part in the political intrigues and attempts of the duchess de Berri. He died of cholera at Görz, on 6th Nov., 1836. His last surviving descendant, in the male line, was his grandson, the count of Chambord (q.v.).

CHARLES IV., German emperor (1346-78), was b. at Prague in 1316, and was the son of king John of Bohemia, of the house of Luxembourg, who fell in the battle of Crecy. At the instigation of Pope Clement VI., to whom he had previously taken an oath of humiliating submission at Avignon, he was elected emperor by a portion of the electors on 11th July, 1346, although Louis IV. then actually filled the imperial throne. But even after the death of Louis, it was not without difficulty that he obtained secure possession of it. He was crowned king of Italy at Milan in 1354, and emperor at Rome in 1355. In 1356, he issued the golden bull (q.v.), the fundamental law concerning the election of German emperors; in defiance of the very letter of which he afterwards, by large bribes, secured for his own son, Wenceslaus, the succession to the empire. He died at Prague, 29th Nov., 1378. C. was an artful politician, but destitute of true greatness. He sought the support of the clergy by undue concessions, sold rights and privileges in Italy and other parts of the empire for money, and cared chiefly for the prosperity of his hereditary kingdom of Bohemia.

CHARLES V., German emperor, was b. at Ghent on 24th Feb., 1500. He was the eldest son of Philip, archduke of Austria, and of Joanna, the daughter of Ferdinand and Isabella of Spain. Philip's parents were the emperor Maximilian and Maria, daughter and heiress of Charles the Bold, duke of Burgundy. On the death of his grandfather, Ferdinand, in 1516, C. took possession of the throne of Spain by the title of Charles I., his mother Joanna being of disordered intellect and incapable of reigning. He was not, however, very favorably received by the Spanish nobles, who were doubtful of his right, and jealous of the followers whom he brought from the Low Countries, where he had been educated. All the abilities of his famous minister Ximenes (q.v.) were requisite to prevent an open revolt. On the death of Maximilian in 1519, C. was elected German emperor from amongst a number of competitors, chiefly through the influence of the elector Frederic of Saxony. In his earlier years he had been frivolous and dissolute, but he now became mindful of the duties and dignity of his high position. On 22d Oct., 1520, he was crowned at Aix-la-Chapelle, and received from the pope the title of Roman emperor. He ascended the imperial throne at a

time when Germany was in a state of unprecedented agitation concerning the doctrines proclaimed by Luther. To restore tranquillity, a great diet was held at Worms in 1521, Luther's declaration of his principles before which forms a well-known and important passage in the history of the reformation. In 1522, he reduced to subjection the towns of Castile, which had leagued themselves together for the maintenance of their ancient liberties. He was likewise successful in his war against the Turks under Solymán the great. C. was involved also in a struggle of long duration with France, in which, after many alternations of fortune, his armies at last drove the French from the greater part of their conquests in Italy; and Francis I. of France fell into his hands as a prisoner, after a battle by which the siege of Pavia was raised on 24th Feb., 1525.

The pope, however, began to grow alarmed at his victories, and therefore allied himself with France and the principal Italian states, and released the king of France from the obligations under which he had come by his treaty with Charles. It was the pope's object to exclude C. from all dominion in Italy; but the emperor's forces under Charles of Bourbon, the former constable of France, took Rome itself by storm, plundered it, and made the pope prisoner. C. pretended great regret for this, went into mourning with all his court, and caused prayers to be said for the pope's liberation, whilst by his own directions the pope was kept for seven months a captive. Peace was concluded in 1529, on terms most favorable for the emperor. He now thought to put an end to the religious differences in Germany, and to repel the Turks, who had overrun Hungary and laid siege to Vienna. But the diet at Augsburg in 1530, proved how vain was the hope of restoring the former state of things in Germany; and the emperor refusing to recognize the confession of the Protestants, they refused to help him against the Turks. In 1531, the Protestant princes formed the league of Schmalkald (q.v.), and allied themselves with France and England for their own protection. This, and the continued assaults of the Turks, compelled the emperor to yield in some measure to the demands of the Protestants. In 1535, C. undertook an expedition from Spain against the pirate Barbarossa, who had established himself in Tunis, and whose vessels did prodigious injury to the commerce of Spain and Italy. In this expedition he was completely successful, and set free no fewer than 22,000 Christians, who had been held as slaves. War again broke out with France; an armistice for ten years was concluded in 1538; and C. even visited Paris, where he was magnificently entertained. But the war broke out afresh in 1542, and terminated in favor of the emperor; who also triumphed in the battle of Mühlberg, 25th April, 1547, over the Protestant princes of Germany, and deprived the elector John Frederic of Saxony of his territories. But he showed so plainly his intention of converting the German empire into a hereditary possession of his family, that new opposition arose, and C. was compelled to flee before the arms of duke Maurice of Saxony and the Protestants, and in 1552 to promise them the peaceful exercise of their religion, which was confirmed by the diet at Augsburg in 1555. Henry II. of France also took from C. some parts of Lorraine. His health failing, C. now declared, in an assembly of the states of Louvaine, his resolution to seek repose, and devote the remainder of his days to God. He resigned the government of his dominions to his son, for whom, however, he vainly sought to secure the imperial throne; and having relinquished to him the crown of Spain on 15th Jan., 1556, he retired to the monastery of Yuste, in Estremadura, where he spent two years partly in mechanical amusements, partly in religious exercises, which are said to have assumed a character of the most gloomy asceticism, and died on 21st Sept., 1558. By his wife Isabella, daughter of king Emmanuel of Portugal, he had one son, his successor, Philip II. of Spain, and two daughters. His brother Ferdinand succeeded him in the empire.

CHARLES VI., German emperor, 1711–40, the last of the proper male line of the house of Hapsburg, was the second son of the emperor Leopold I., and b. 1685. His father intended for him the crown of Spain; but Charles II. of Spain, yielding to French intrigues, assigned it by testament to Philip of Anjou, whereupon arose the great war of the Spanish succession—Britain and Holland taking part with the emperor against France, for the maintenance of the balance of power in Europe. C. was acknowledged by the allies as Charles III. of Spain, but had not succeeded in obtaining permanent possession of the kingdom, when the death of his brother, the emperor Joseph I., recalled him to Germany in 1711; and as he now became emperor of Germany, Britain and Holland concluded the peace of Utrecht with France in 1713. C. continued the war for some time longer; but was at last obliged to give up his claim to Spain, being confirmed, however, in possession of the Spanish Netherlands and of the Spanish possessions in Italy. Success attended his arms in a war against the Turks, and in a war with Spain, which arose out of the project, of the Spanish minister Alberoni, and in which the *quadruple alliance* was formed—France, Britain, and Holland joining the emperor against Spain. But C., having lost his only son, and being very anxious to secure the throne to his own descendants, named his daughter, Maria Theresa (q.v.), as his heiress, by a *pragmatic sanction* (q.v.), to which he had much difficulty in obtaining the consent of some of the German states and some foreign powers; and to accomplish this object he gave up Tuscany, Parma, and Piacenza, and afterwards Naples, Sicily, Lorraine, and some parts of Milan. Meanwhile, he was unsuccessful in wars

with France and Spain, and with the Turks, who compelled him, in 1739, to resign his former conquests. He died 20th Oct., 1740. He was of a mild and benevolent disposition, but full of superstition and of prejudices in favor of feudalism and ecclesiastical domination.

CHARLES VII., German emperor (1742-45), was b. at Brussels in 1697, and was the son of Maximilian Emmanuel, elector of Bavaria, and for some time governor of the Spanish Netherlands. After the conquest of the Bavarian territories, and the pronouncement of the ban of the empire against his father by the emperor Joseph I., he was for some time the emperor's prisoner; but after the decease of Joseph, he married his youngest daughter; and having, in 1726, succeeded his father as elector of Bavaria, refused his consent to the pragmatic sanction (see preceding article); and on the death of Charles VI. in 1740, advanced a claim to the Austrian dominions in right of his wife, and upon the further ground of a testament of Ferdinand I. Success at first attended his arms; he was acknowledged as archduke of Austria, and then as king of Bohemia, upon which he was also, in 1742, elected emperor. But the tide of fortune now turned against him. The Hungarians rose in favor of Maria Theresa, and he was driven from Austria and from Bohemia, and for a time even from his Bavarian capital, Munich. Disease and calamities combined to cause his death, 20th Jan., 1745, shortly before which he said, "Misfortune will never leave me till I leave it."

CHARLES, Count of Anjou and Provence, King of Naples and Sicily, about 1220-85. He was the ninth son of Louis VIII. of France, and wedded Beatrice, heiress of Provence, after scattering his rivals by the aid of an army furnished by his brother, Louis IX. His next adventure was on a crusade to the Holy Land in company with his brother, when both were taken prisoners. Returning to Provence, Charles resumed his authority, and began to cherish high ambitions. He first assisted Margaret of Flanders, in a plan to set aside the children of her husband by a former wife, for the aggrandizement of her own offspring, for which Charles was to receive the province of Hainault; but Louis interfered and Charles was compelled to relinquish Hainault for a sum of money. About this time the pope, Urban IV., requested Charles to assume the crown of the Two Sicilies, to assist in the overthrow of the bastard Manfred, the Ghibelline king; and in 1265, Charles was crowned at Rome; a crusade was preached against Manfred, who was taken and killed; Conradin, the legitimate heir, was also betrayed, captured, and murdered; a like fate was dealt out to many Italian nobles; estates were confiscated to reward the French mercenaries; and they established over Sicily an arbitrary and brutal rule. Charles aimed at becoming the head of the eastern empire. With this intent he accompanied his brother on another crusade; but the venture failed in consequence of a great storm and the breaking out of the plague. Charles also incurred the enmity of the pope, Nicholas II., by refusing to accept the hand of his niece for Charles's grandson; so Nicholas went over to the Ghibellines, and took from Charles his titles. But Nicholas died in 1280, and Charles procured the election of a Frenchman, Martin IV., to the chair of St. Peter, in return for which Charles was made senator of Rome, and his rival, the emperor Michael Palæologus, was excommunicated. Another expedition was ready for the east, when news was brought of the rebellion, afterwards known as the Sicilian Vespers (q.v.); the people of Sicily had risen against their conquerors, and on Easter Monday, 1282, nearly exterminated the French in all Sicily. Charles at once sent his fleet against Messina, refusing all offers of capitulation; but the city held out until assistance came from Don Pedro of Aragon, and Charles's fleet was burned. Despairing of other means of success, Charles challenged Don Pedro to single combat; the latter accepted, but only Charles appeared in the list. Soon afterwards Charles's son was defeated and taken prisoner; and in 1285, Charles himself fell ill and died at Poggia.

CHARLES III., of DURAZZO, 1345-87; King of Naples and Hungary. His father, who had rebelled against the queen, Joanna I. of Naples, died in prison; and the queen adopted the son, but afterwards displaced him in favor of Louis of Anjou, the father of Charles V. of France. Charles made an alliance with the king of Hungary, and set out to invade Naples. At Rome he was crowned king by the pope; thence he went to Naples, captured the queen, and had her assassinated. Three years later he was invited to accept the crown of Hungary by the nobles, who were dissatisfied with the rule of Queen Elizabeth, and was crowned on the last day of the year 1386. Five weeks afterwards Elizabeth caused him to be murdered in her own presence. As he and his kingdom of Naples were under papal interdict, his body remained unburied for five years.

CHARLES I., b. 1839; King of Roumania, second son of Prince Charles Anthony of Hohenzollern. In 1866, Charles was elected Regent of Roumania by an almost unanimous vote. He found the country in a wretched condition, the treasury empty, education unprovided for, and the people divided into warring political factions. By energy and good statesmanship he greatly improved matters, and when the Russo-Turkish war began he seized the occasion to proclaim Roumania's entire independence of Turkey, and such a declaration was officially made by the chambers. In 1869 Charles married Princess Elizabeth of Wied (CARMEN SYLVA). In 1881 he was proclaimed king.

CHARLES II., 1661-1700 ; King of Spain ; son of Philip IV. He was but four years old when his father died, the regency being in the hands of the queen, Anna Maria of Austria. During her rule, Spain was much weakened by an unsuccessful war with France and by the loss of Sicily. In 1675, Charles assumed the government, taking for his chief adviser Don John, an illegitimate son of the late king. By marrying Louise of Orleans, a niece of Louis XIV., Charles maintained harmony with France for several years. After her death, Charles married a sister of the emperor, Leopold I., and in 1694 he joined Leopold in a war against France. The war was speedily concluded by the peace of Ryswick, 1697, and as Charles was childless there was a long negotiation concerning the succession, ended through the influence of the pope, who secured the crown for the grandson of Louis XIV., Philip Bourbon, who ruled Spain as Philip V.

CHARLES III., 1716-88 ; King of Spain, second son of Philip V., and great-grandson of Louis XIV. of France. Parma, Piacenza, and Tuscany having fallen to Spain, Charles, at the age of 15, was furnished with an army and given rule over those countries. At 18 he conquered the Two Sicilies, and the emperor was obliged to acknowledge him as king. On the death of his brother, Charles succeeded to the Spanish throne, in 1759. He was a man of ability and liberal ideas, and made many reforms, especially in financial administration. The Jesuits were banished, and an unsuccessful effort was made to bring the inquisition under the control of the civil power. He endeavored to put a stop to brigandage and to Algerine piracy ; and interested himself in the development of commerce, and arts and sciences. In 1763, he ceded Florida to England in exchange for Cuba, and some years later he joined France in sending assistance to the American colonies, then engaged in the war for independence. At the close of the war, Florida was again given to Spain. He made an unsuccessful attempt to rescue Gibraltar from the English. Charles died in Madrid after a reign of 29 years.

CHARLES IV., 1748-1819 ; King of Spain, son and successor of Charles III. When very young, Charles married his cousin, Maria Louise of Parma, who soon acquired great influence over him. The government was conducted chiefly by Manuel Godoy, a handsome guardsman who gained the friendship of both the queen and her husband, and was made duke of Alcudia, and minister of foreign affairs. Godoy concluded peace with the French republic in 1795, after an unsuccessful attempt on the part of the king to assist his relative, Louis XVI. Soon after this peace an offensive and defensive alliance was made with France, and Spain speedily became involved in war with Portugal and also with England, the main event of which was the destruction of the Spanish fleet by Nelson at Trafalgar in 1805. In 1807, Charles made with Napoleon a secret treaty according to which Portugal was to be seized by the French and Spanish, and the greater part to be divided between Godoy and the queen of Etruria, and Charles was to assume the title of emperor of America ; at the same time, 16,000 Spanish troops were to be sent to the assistance of the French in Denmark. While this was going on, Napoleon was intriguing with Don Ferdinand, the heir to the throne, who was soon after discovered in a plot to assassinate his father. Though pardoned, Ferdinand continued to do all that he could to arouse ill feeling against the court, and in 1808, Charles was so alarmed at disturbances in Madrid, that he abdicated in Ferdinand's favor. Charles declared immediately that this act was not voluntary ; but the matter was decided by a meeting with Napoleon at Bayonne, urged by Godoy, who was moved by fear of Ferdinand, and also by the queen. Charles surrendered the crown to Napoleon (who gave him a pension of six millions of francs, and the castle and grounds of Chambord), refusing again to assume authority, although he might have done so, his son being very unpopular.

CHARLES IX., 1550-1611 ; King of Sweden, the fourth son of Gustavus Vasa. The Swedish crown belonged to Charles's nephew, Sigismund, king of Poland ; but as he was a Roman Catholic, Charles was appointed to direct the government till Sigismund signed a decree establishing the Lutheran religion in Sweden. After many attempts at accommodation, Sigismund was formally deposed in 1604, and Charles was elected king. He had wars with Poland, Russia, and Denmark, and when 60 years old he challenged the king of Denmark to single combat, but the Dane did not respond. Charles founded the university of Gothenburg, and made a new code of laws. He wrote a rhymed chronicle of the war with Poland.

CHARLES X., or **CHARLES-GUSTAVUS**, king of Sweden, was b. at Nyköping, 8th Nov., 1622. After studying at the university of Upsala, he traveled through France, Germany, and Switzerland, joined the army of Torstensohn (q.v.) in 1642, fought at the battles of Yankovitz and Leipzig ; and at the close of the war was the representative of Queen Christina at the conferences which were held for giving effect to the treaty of Westphalia. On the abdication of Christina, Charles-Gustavus, who was the son of Gustavus Adolphus' eldest sister Catharine and John Casimir, the palatine of Zweibruck in Clerburg, succeeded as next heir, 17th June, 1654, to the throne of a kingdom which, after his accession, he discovered to be in an almost bankrupt condition. There was a debt of 10,000,000, while the revenue did not amount to 800,000 crowns, out of which one fourth was granted as a pension to the ex-queen, whose carelessness and extravagance had brought about this deplorable state of matters, and who, in the words of the aged chancellor Öxenstierna, " had cost Sweden dearer than ever an enemy did."

She had taken away everything belonging to the royal residences which was portable; and C. was forced at first to borrow even a set of kitchen utensils. C. was the second of the three great warrior-monarchs of Sweden, but unlike his uncle, who could plead religious grounds, and his grandson, who was at first forced to fight for self-preservation, C. seemed to make war principally for war's sake. First, he attacked Poland in July, 1655, because the Polish monarchs had not resigned their claim to the Swedish throne; captured in the same year Warsaw, Cracow, Thorn, Elbing, Posen, and Kaliez; and drove the king to take shelter in Silesia; he then assailed the Danes, who had declared war against him, crossed the belts on the ice, and speedily made himself master of all the continental possessions of Denmark. Next marching from isle to isle over the frozen sea, he ultimately, by menacing Copenhagen, compelled the treaty of Roskild (7th Mar., 1658), which gave to Sweden, Holland, Scania, Bleckingen, Bornholm, and the other Danish possessions beyond the sound, and emancipated Sweden from the sound dues. Charles, however, still cherished enmity against the Danes; and after fruitlessly proposing to the Dutch and English, a partition of Denmark, he invaded Zeeland, and attacked Copenhagen in 1659. The capital, however, defended itself valiantly, aided by succor from the Prussians and Dutch; and the Swedish monarch was compelled to abandon the siege. Soon after, while laboring to effect a complete reconciliation with Poland in order to be free to attack the Danes in Norway, he died suddenly at Gothenburg, Feb. 23, 1660.

CHARLES XI., one of the ablest kings of Sweden, was the son of king Charles (X.) Gustavus, and was b. Nov. 24, 1655. While he was little more than four years old at his father's death, the government was committed to his mother Hedwig as regent, and a council. The peace of Oliva (May 3, 1660) with Poland, by which Sweden obtained Esthonia, part of Livonia, and Oesel, and the Polish monarch renounced all pretensions to the Swedish crown; and that of Copenhagen (June 6, 1660), generally confirmatory of the treaty of Roskild with Denmark, were the first important acts of the government. A treaty with Russia on the basis of the *status quo* followed in 1661; and from this period till 1672, the kingdom was free from foreign wars. In Dec., 1672, C. (whose education had been so ill attended to that he had reached manhood before he could read) took the reins of government, and by the allurements of France, was induced to make war on Brandenburg. This unprovoked attack was disastrous to the Swedes, for they suffered a severe defeat from the elector at Fehrbellin (1675); and though C. revenged himself by defeating the Danes (who were allied with Prussia) at Halmstadt, Lemd, and Landskrona, his fleet was defeated by the Dutch near Oeland, and again by the Danes at Bleking and Kiöge; and many of Sweden's recent acquisitions were wrested from her. These, however, were restored by the peace of Saint-Germain-en-Laye (17th Sept., 1679), which closed this needless and unfortunate contest. In 1680, a struggle commenced between the crown, supported by the burghers and peasants, on one hand, and the nobles on the other; and a considerable diminution of the power of the nobles was the consequence. The resumption of all the crown lands which had been alienated since 1609, was a fatal blow to the preponderating power of the nobles; and by a voluntary declaration of the states, Dec. 9, 1682, the king was invested with absolute authority. This voluntary erection of a despotism by the people, a thing of rare occurrence in the world's history, is yet more extraordinary at the close of the 17th c.; and it speaks highly for C. that he never employed his unlimited authority otherwise than for the best interests of his kingdom. By a judicious administration of the revenues, he was enabled to extinguish the public debt (1686), reorganize the fleet and army, and by 1693 to dispense with the calling up of extraordinary subsidies. Though absolute, he never imposed a tax but with consent of the states; and he every year published a detailed account of revenue and expenditure. In 1693, he was formally declared absolute by an act of the diet. The foreign policy of the country was also conducted in a manner equally satisfactory and effective. Deux-Ponts fell to him as heir to his cousin Friedrich-Ludwig, the last palatine, in 1681; the attempts of the Danes upon Holstein were rigorously repressed, and many small outlying territories were brought under his sway. His anxiety for his subjects' welfare was particularly shown by commercial and maritime regulations superior to any that then existed in Europe; and by his numerous journeys to all parts of his dominions to examine for himself into the remote details of the administration. A codification of the laws was commenced but was unfinished at his death, which took place at Stockholm, 15th April, 1697.

CHARLES XII., King of Sweden (1697-1718), was the son of Charles XI., and was b. at Stockholm on the 27th June, 1682. On the death of his father in 1697, he ascended the throne, and notwithstanding his youth, the states declared him of age to assume the reins of government. The neighboring powers thought this a favorable time to humble Sweden, then the great power of the n.; and Frederick IV. of Denmark, Augustus II. of Poland, and the czar Peter I. concluded a league for this object. The Danes began by invading the territory of the duke of Holstein Gottorp, who had married C.'s eldest sister, and who applied to him for assistance. The young king immediately resolved on the most active measures, and approached Copenhagen with such a force as presently compelled the Danes to make peace. C. now hastened to meet the Russians; and although they lay in an intrenched camp beneath the walls of Narva, 50,000 strong, he
